The following linguistic stocks are represented by printed dictionaries (in one or more dialects): Algonkian, Athabaskan, Chinookan, Eskimoan, Iroquoian, Lutuamian, Muskogian, Salishan, Shoshonian, Siouan. There exists a considerable number of texts (myths, legends, historical data, songs, grammatical material, &c.) in quite a number of Indian languages that have been published by scientific investigators. The Algonkian (*e.g.* Jones's *Fox Texts*, 1908), Athabaskan (*e.g.* Goddard's *Hupa Texts*, 1904, Matthews's *Navaho Legends*, 1897, &c.), Caddoan (*e.g.* Miss A. C. Fletcher's *Hako Ceremony*, 1900), Chinookan (Boas's *Chinook Texts*, 1904, and *Kathlamet Texts*, 1901), Eskimoan (texts in Boas's *Eskimo of Baffin Land*, &c., 1901, 1908; and Thalbitzer's *Eskimo Language*, 1904, Barnum's *Innuit Grammar*, 1901), Haidan (Swanton's *Haida Texts*, 1905, &c.), Iroquoian (texts in Hale's *Iroquois Book of Rites*, 1883, and Hewitt's *Iroquoian Cosmology*, 1899), Lutuamian (texts in Gatschet's *Klamath Indians*, 1890), Muskogian (texts in Gatschet's *Migration Legend of the Creeks*, 1884–1888), Salishan (texts in various publications of Boas and Hill-Tout), Siouan (Riggs and Dorsey in various publications), Tsimshian (Boas's *Tsimshian Texts*, 1902), Wakashan (Boas's *Kwakiutl Texts*, 1902–1905), &c.

Migrations of Indian stocks.

The question of the direction of migration of the principal aboriginal stocks north of Mexico has been reopened of late years. Not long ago there seemed to be practical agreement as to the following views. The Eskimo stock had reached its present habitats from a primitive home somewhere in the interior of north-western Canada or Alaska; the general trend of the Athabaskan migrations, and those of the Shoshonian tribes had been south and south-east, the first from somewhere in the interior of north-western Canada, the second from about the latitude of southern British Columbia; the Algonkian tribes had moved south, east and west from a point somewhere between the Great Lakes and Hudson Bay; the Iroquoian stock had passed southward and westward from some spot to the north-east of the Great Lakes; the Siouan tribes, from their primitive home in the Carolinas, had migrated westward beyond the Mississippi; some stocks, like the Kitunahan, now found west of the Rocky Mountains, had dwelt formerly in the plains region to the east. Professor Cyrus Thomas, however, of the Bureau of American Ethnology, discussing primary Indian migrations in North America (*Congr. intern. d. Amér.*, Quebec, 1906, i. 189-204), rejects the theory that the Siouan stock originated in the Carolinas, and adopts for them an origin in the region north of Lake Superior, whence he also derives the Iroquoian stock, whose primitive home Dr David Boyle (*Ann. Archaeol. Rep. Ontario*, 1905, p. 154), the Canadian ethnologist, would place in Kentucky and southern Ohio. Another interesting contribution to this subject is made by Mr P. E. Goddard (*Congr. intern. des. Amér.*, Quebec, 1906, i. 337-358). Contemplating the distribution of the tribes belonging to the Athabaskan stock in three divisions, viz. a northern (continuous and very extensive), a Pacific coast division (scattered through Washington, Oregon, California), and a southern division which occupies a large area in Arizona, New Mexico, Colorado, Kansas, Texas and Mexico, Mr Goddard suggests that the intrusion of non-Athabaskan peoples into a region once completely in the possession of the Athabaskan stock is the best explanation for the facts as now existing not explicable from assimilation to environment, which has here played a great rôle. It is possible also that a like explanation may hold for the conditions apparent in some other linguistic stocks. Many Indian tribes have been forcibly removed from their own habitats to reservations, or induced to move by missionary efforts, &c. Thus, in the state of Oklahoma are to be found representatives of the following tribes: Apache, Arapaho, Caddo, Cherokee, Cheyenne, Chickasaw, Choctaw, Comanche, Creek, Iowa, Kansa, Kickapoo, Kiowa, Miami, Missouri, Modoc, Osage, Oto, Ottawa, Pawnee, Peoria, Ponca, Potawatomi, Quapaw, Sac and Fox, Seminole, Seneca, Shawnee, Tonkawa, Wichita, Wyandot, &c.; these belong to 10 different linguistic stocks, whose original habitats were widely distant from one another in many cases.

Some of the American-Indian linguistic stocks (those of California especially) hardly know real tribal divisions, but local groups or settlements only; others have many large and important tribes.

The tabular alphabetical list given in the following pages contains the names of the more important and more interesting tribes of American aborigines north of Mexico, and of the stocks to which they belong, their situation and population in 1909, the degree of intermixture with whites or negroes, their social, moral and religious condition, state of progress, &c., and also references to the best or the most recent literature concerning them.

Up to the date of their publication references to the literature concerning the tribes of the stocks treated will be found in Pilling's bibliographies: Algonquian (1891), Athabascan (1892), Chinookan (1893), Eskimoan (1887), Iroquoian (1888), Muskhogean (1889), Salishan (1893), Siouan (1887) and Wakashan (1894). See also the *Handbook of American Indians North of Mexico* (Washington, 1907–1910); and the sumptuous monograph of E. S. Curtis, *The North American Indian* (N. Y., vols. i.-xx., 1908), with its remarkable reproduction of Indian types.

Tribe.	Stock.	Situation, Population, &c.	Degree of Intermixture.	Condition, Progress, &c.	Authorities.
Abnaki.	Algonkian.	At Becancour, Quebec, 27; at St François du Lac and Pierreville, 330. Decreasing.	Probably no pure blood left.	As civilized as the neighbouring whites. All Catholics.	Maurault, *Hist. des Abénaquis* (Quebec, 1866); Jack, *Trans. Canad. Inst.*, 1892-1893.
Achomawi (Pit river Indians).	Shastan.	N.E. California. About 1100 in the Pit river region; also 50 or 60 on the Klamath Reservation, Oregon.	Little.	Progress very slow; influence of schools felt. Klamath Achomawi under Methodist influence.	Powers, *Contrib. N. Amer. Ethnol.*, vol. iii., 1877; various writings of Dr R. B. Dixon, *American Anthropologist*, 1905-1908, &c.
Aleuts.	Eskimoan.	Aleutian Islands and part of Alaska. About 1600. Decreasing.	About 50 % are mixed bloods.	"Decaying." Once converted to Greek Orthodox church. Methodist mission at Unalaska.	Works (in Russian) of Veniaminov, 1840-1848; Golder, *Journ. Amer. Folk-Lore*, 1905-1907; Chamberlain, *Dict. Relig. and Ethics* (Hastings, vol. i., 1908).
Amalecites (Maliseets).	Algonkian.	106 at Viger (Cacouna, Quebec); 702 in various parts of W. New Brunswick. Apparently increasing.	Probably few pure bloods.	Fairly good. At Viger industrially unsettled. Catholics.	Writings of S. T. Rand; Chamberlain (M.), *Maliseet Vocabulary* (Cambridge, 1899).
Apache.	Athabaskan.	In Arizona, 4879; New Mexico, 1244; Oklahoma, 453. Not rapidly decreasing as formerly thought.	Considerable Spanish blood due to captives, &c.	Marked improvement here and there. Catholic and Lutheran missions.	Cremony, *Life among the Apaches* (1868); Bourke, *9th Ann. Rep. Bur. Ethnol.*, 1887-1888, and *Journ. Amer. Folk-Lore*, 1890; Hrdlička, *American Anthropologist*, 1905.
Arapaho.	Algonkian.	358 at Ft. Belknap Reservation, Montana; 873 at Wind river Reservation, Wyoming; 885 in Oklahoma. Holding their own.	Some Spanish (Mexican) blood in places.	Oklahoma Arapaho American citizens; progress elsewhere. Mennonite missions chiefly; also Dutch Reformed.	Writings of Kroeber and Dorsey, *Bull. Amer. Mus. Nat. Hist.*, 1900-1907, and *Publ. Field Columb. Mus.*, 1903; Scott, *Amer. Anthrop.*, 1907.
Assiniboin.	Siouan.	In Montana, 1248; Alberta, 971; Saskatchewan, 420.	Some little.	In Canada "steady advance," elsewhere good. Alberta Assiniboins are Methodists; in Montana Catholic and Presbyterian missions on reservations.	Maclean, *Canadian Savage Folk* (Toronto, 1890); McGee, *15th Ann. Rep. Bur. Ethnol.*, 1893-1894.
Babines.	Athabaskan.	530 on Babine Lake, Bulkley river, &c., in central British Columbia.	Little, if any.	Conservative. Little progress. Reached by Catholic mission of Stuart Lake, B.C.	Morice, *Anthropos*, 1906-1907, and *Ann. Arch. Rep. Ontario*, 1905, and other writings.
Bannock.	Shoshonian.	About 500 at Ft. Hall, and 78 at Lemhi Agency, Idaho.	Little.	Considerable improvement morally and industrially.	Hoffman, *Proc. Amer. Philos. Soc.*, 1886; Mooney, *14th Ann. Rep. Bur. Ethnol.*, 1892-1893; Lowie, *Anthrop. Pap. Amer. Mus. Nat. Hist.*, 1909.
Beaver.	Athabaskan.	About 700 on Peace river, a western affluent of Lake Athabaska.	Very little.	Rather stationary.	See Babines.
Bilqula (Bellacoola).	Salishan.	287 on Dean Inlet, Bentinck Arm, Bellacoola river, &c., coast of central British Columbia. Decreasing.	Little.	Not very encouraging. Mission influence not yet strongly felt.	Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1891, and *Mem. Amer. Mus. Nat. Hist.*, 1898.
Blackfeet (Siksika).	Algonkian.	About 824 in Alberta, Canada. Decreasing.	Little.	Steadily improving morally and financially. Anglicans, 237; Catholics, 260; pagans, 327.	Maclean, *Canadian Savage Folk* (Toronto, 1890), and other writings; Grinnell, *Blackfoot Lodge-Tales* (N.Y., 1903), and other writings; Wissler, *Ann. Arch. Rep. Ontario*, 1905; Schultz, *My Life as an Indian* (N.Y., 1907); Wissler, *Anthrop. Pap. Amer. Mus. Nat. Hist.*, 1908.
Bloods.	Algonkian.	1168 near Ft. Macleod, Alberta. Probably decreasing somewhat.	Little.	All able-bodied Indians will soon be self-supporting. Presbyterians, 150; Catholics, 150; the rest pagan.	See Blackfeet.
Caddo.	Caddoan.	550 in Oklahoma. Increasing slightly.	Considerable French blood.	Citizens of United States. Catholic, Methodist and Presbyterian missions.	Mooney, *14th Ann. Rep. Bur. Ethnol.*, 1892-1893; writings of Fletcher, Dorsey, &c.
Cariboo-Eaters.	Athabaskan.	1700 in the region E. of Lake Athabaska, N.W. Canada.	Little, if any.	Little progress.	See Babines.
Carriers.	Athabaskan.	970 between Tatla Lake and Ft. Alexandria, central British Columbia.	Little.	Semi-sedentary and naturally progressive as Indians; improvements beginning to be marked. Under influence of Catholic mission at Stuart Lake, B.C.	Morice, *Proc. Canad. Inst.*, 1889, *Trans. Canad. Inst.*, 1894, *Hist. of Northern Inter. of British Columbia* (Toronto, 1904), and other writings. See Babines.
Catawba.	Siouan.	About 100 on the Catawba river, York county, South Carolina. Decreasing.	Much mixed with white blood.	Slowly adopting white man's ways. Chiefly farmers.	Mooney, *Siouan Tribes of the East* (Washington, 1894); Gatschet, *American Anthropologist*, 1900; Harrington, *ibid.*, 1908.
Cayuga.	Iroquoian.	179 on the Iroquois Reservations in New York State; 1044 with the Six Nations in Ontario; also some with the Seneca in Oklahoma and with Oneida in Wisconsin.	Some English admixture.	Canadian Cayuga steadily improving; they are "pagan."	See Six Nations.
Cayuse.	Wailatpuan.	405 on Umatilla Reservation, Oregon.	About ¼ are of mixed blood, chiefly French.	Conditions improving. Good work of Catholic and Presbyterian missions.	Mowry, *Marcus Whitman* (1901); Lewis, *Mem. Amer. Anthrop. Assoc.*, 1906.
Chehalis.	Salishan.	182 on Puyallup Reservation, Washington. Perhaps increasing slightly.	No data.	Gradually improving and generally prosperous. Congregational mission.	Gibbs, *Contrib. N. Amer. Ethnol.*, vol. iii., 1877; Eells, *Hist. of Ind. Missions on the Pacific Coast* (N.Y., 1882), and other writings.
Chemehuevi.	Shoshonian.	About 300 on the Colorado Reservation; a few elsewhere in Arizona and California.	No data.	Some improvement. Missions of the Presbyterians and of the Church of the Nazarene.	See Ute.
Cherokee.	Iroquoian.	About 28,000, of which 1489 are in North Carolina and the rest in Oklahoma.	Not more than ¼ are of approximately pure blood.	Oklahoma Cherokee citizens of the United States, and making excellent progress. Various religious faiths.	Royce, *5th Ann. Rep. Bur. Ethnol.*, 1883-1884; Mooney, *7th Rep.*, 1885-1886, and especially *19th Rep.*, 1897-1898.

Tribe.	Stock.	Situation, Population, &c.	Degree of Intermixture.	Condition, Progress, &c.	Authorities.
Cheyenne.	Algonkian.	1440 northern Cheyenne in Montana, 1894 southern Cheyenne in Oklahoma. Former increasing, latter decreasing.	Some white blood, from captives, &c.	Southern Cheyenne citizens of United States; Mennonite mission doing good work. Northern Cheyenne making progress as labourers, &c.; Mennonite and Catholic missions.	Mooney, *14th Ann. Rep. Bur. Ethnol.*, 1892-1893; Dorsey, *Publ. Field Columb. Mus.*, 1905; Grinnell, *Intern. Congr. Americanists*, 1902-1906; *Journ. Amer. Folk-Lore*, 1907-1908; *Amer. Anthrop.*, 1902-1906; Mooney and Petter, *Mem. Amer. Anthrop. Assoc.*, 1907.
Chickahominy.	Algonkian.	Some 220 on Chickahominy river, Virginia.	No pure bloods left. Considerable negro admixture.	Fishers and Farmers.	Tooker, *Algonquian Series* (N.Y., 1900); Mooney, *Amer. Anthrop.*, 1907.
Chickasaw.	Muskogian.	5558 in Oklahoma.	Large admixture of white blood.	American citizens and progressing well. Various religious faiths.	Speck, *Journ. Amer. Folk-Lore*, 1907, and *Amer. Anthrop.*, 1907.
Chilcotin.	Athabaskan.	About 450 on Chilcotin river, in S. central British Columbia.	Little.	Fairly laborious, but clinging to native customs, though making progress. Catholic mission influence.	Writings of Morice (see Carriers); Farrand, *Mem. Amer. Mus. Nat. Hist.*, 1900.
Chilkat.	Koluschan.	About 700 at head of Lynn Canal, Alaska. Decreasing.	No data.	Little progress.	Emmons and Boas, *Mem. Amer. Mus. Nat. Hist.*, 1908.
Chinook.	Chinookan.	About 300 in Oregon. Decreasing.	Some little.	Stationary or "worse."	Boas, *Chinook Texts* (Washington, 1894), and other writings; Sapir, *Amer. Anthrop.*, 1907.
Chipewyan.	Athabaskan.	About 3000 in the region S. of Lake Athabaska, N.W. Canada.	Some Canadian-French admixture.	Coming to be more influenced by the whites. Reached by Catholic missions.	Writings of Petitot, Legoff, Morice (see Babines), &c.; Morice, *Anthropos*, 1906-1907, and *Ann. Arch. Rep. Ontario*, 1905.
Chippewa (Ojibwa)	Algonkian.	About 18,000 in Ontario, Manitoba, &c.; nearly the same number in the United States (Michigan, Wisconsin, Minnesota, N. Dakota).	Much French and English admixture in various regions.	Good progress. Many Indians quite equal to average whites of neighbourhood. Among the Canadian Chippewa the Methodists, Catholics and Anglicans are well represented; among those in the United States the Catholics and Episcopalians chiefly, also Methodists, Lutherans, &c. A number of native ministers.	Warren, *Minn. Hist. Soc. Coll.*, 1885; Blackbird, *Ottawa and Chippewa Indians* (1887); W. Jones, *Ann. Arch. Rep. Ontario*, 1905; Hugolin, *Congr. int. d. Amér.* (Quebec, 1906); P. Jones, *Hist. Ojebway Inds.* (1861).
Choctaw.	Muskogian.	17,529 in Oklahoma; 1356 in Mississippi and Louisiana.	Large element of white and some negro blood.	Citizens of United States, making good progress. Various religious faiths.	Gatschet, *Migration Legend of Creeks* (1884-1888); Speck, *Amer. Anthrop.*, 1907.
Clayoquot.	Wakashan.	224 in the region of Clayoquot Sound, Vancouver Island. Decreasing.	No data.	Rather stationary, but beginning to improve. Influence of Catholic mission and industrial school.	See Nootka.
Clallam.	Salishan.	354 on Puyallup Reservation, Washington.	Little.	Improving, but suffering from white contact. Congregationalist mission.	Eells in *Ann. Rep. Smiths. Inst.*, 1887, and other writings.
Colville.	Salishan.	316 at Colville Agency, Washington. Decreasing slightly.	Some Canadian-French, &c.	Improving.	See Chehalis.
Comanche.	Shoshonian.	1408 in Oklahoma. Now holding their own.	Some due to Spanish (Mexican) captives, &c.	Good progress, in spite of white impositions.	Mooney, *14th Ann. Rep. Bur. Ethnol.*, 1892-1893.
Cowichan.	Salishan.	About 1000 on E. coast of Vancouver Island, and on islands in Gulf of Georgia.	Little.	Industrious; steady progress. Catholic and Methodist missions, chiefly former.	Hill-Tout, *Rep. Brit. Assoc. Adv. Sci.*, 1902, and *Trans. R. Anthrop. Inst.*, 1907; Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1889.
Cree.	Algonkian.	About 12,000 in Manitoba, and some 5000 in Saskatchewan, Alberta, Keewatin, &c.	Large element of French, Scottish and English blood.	Slow but steady progress (except with a few bands). Catholics, Methodists and Anglicans strongly represented by missions and church members; many Presbyterians also.	Writings of Petitot, Lacombe, Horden, Bell, Watkins, Evans, Young, &c.; Lacombe, *Dict. de la langue des Cris* (1876); Russell, *Explor. in the Far North* (1898); Stewart, *Ann. Arch. Rep. Ontario*, 1905; Maclean, *Canad. Sav. Folk* (1890).
Creek.	Muskogian.	11,000 in Oklahoma.	Large element of white blood; some negro.	American citizens, making good progress. Various religious faiths.	Gatschet, *Migration Legend of the Creeks* (1884-1888); Speck, *Mem. Amer. Anthrop. Assoc.*, 1907.
Crows (Absaroka).	Siouan.	1804 at Crow Agency, Montana.	Little.	Improving industrially and financially. Morals still bad.	Simms, *Publ. Field Columb. Mus.*, 1903; Schultz, *My Life as an Indian* (N.Y., 1907).
Dakota (Santee, Yankton, Teton—Sioux).	Siouan.	About 18,000 in South and 4400 in North Dakota; 3200 in Montana; 900 in Minnesota. Seemingly decreasing.	Considerable white blood, varying with different sections.	Capable of and making good progress. Episcopal, Catholic, Congregational missions with good results.	Writings of Dorsey, Riggs, Eastman, &c. Riggs, *Contrib. N. Amer. Ethnol.*, vol. vii., 1890, and vol. ix., 1893; Wissler, *Journ. Amer. Folk-Lore*, 1907; Eastman, *Indian Boyhood* (1902).
Delaware.	Algonkian.	In Oklahoma, 800 with Cherokee and 90 with Wichita; 164 with Six Nations in Ontario.	Considerable.	Oklahoma, Delaware, U.S. citizens, and progressing; Canadians making also good progress.	Brinton, *Lenâpé and their Legends* (Phila., 1885), and *Essays of an Americanist* (1890); Nelson, *Indians of New Jersey* (1894).
Dog-Ribs.	Athabaskan.	About 1000 in the region E. of the Hares, to Back river, N.W. Canada.	Little.	"Wild and indolent," not yet much under white influence.	See Chipewyans, Carriers.
Eskimo (Greenland).	Eskimoan.	West coast, 10,500; East coast, 500. Slowly increasing.	Large element of white blood, estimated already in 1855 at 30%.	More or less "civilized" and "Christian" as result of Moravian missions.	Writings of Rink, Holm, Nansen, Peary. Rink, *Tales and Trad. of the Eskimo* (Lond., 1875) and *Eskimo Tribes* (1887); Nansen, *Eskimo Life* (1893); Thalbitzer, *Eskimo Language* (1904).
Eskimo (Labrador).	Eskimoan.	About 1300.	Considerable on S.E. coast.	Much improvement due to Moravian and (later) other Protestant missions.	Packard, *Amer. Naturalist*, 1885; Turner, *11th Ann. Rep. Bur. Ethnol.*, 1889-1890.

Tribe.	Stock.	Situation, Population, &c.	Degree of Intermixture.	Condition, Progress, &c.	Authorities.
ESKIMO (central regions).	Eskimoan.	About 2500.	Little.	Not much improvement except here and there. Some reached by Episcopalian mission.	Boas, *6th Ann. Rep. Bur. Ethnol.*, 1884-1885, and *Bull. Amer. Nat. Hist.*, 1901 and 1908.
ESKIMO (Mackenzie, &c.).	Eskimoan.	About 1500.	Little.	Not much improvement. Reached by Catholic missions.	Petitot, *Les Grands Esquimaux* (1887), *Monographie des Esquimaux Tchiglit* (Paris, 1876) and other writings; Stefánsson, *Harper's Magazine*, 1908-1909.
ESKIMO (Alaska).	Eskimoan.	About 12,000, exclusive of Aleuts.	Considerable on certain parts of coast.	Much improvement in parts since introduction of reindeer in 1892. Presbyterian, Methodist, Catholic, Moravian, Baptist, Swedish Evangelical, Quaker, Congregational, Lutheran missions now at work.	Dall, *Contrib. N. Amer. Ethnol.*, vol. i., 1877; Murdoch, *9th Ann. Rep. Bur. Ethnol.*, 1887-1888; and Nelson, *18th Rep.*, 1896-1897; Barnum, *Innuit Gramm. and Dict.* (1901).
ESKIMO (N.E. Asia).	Eskimoan.	About 1200.	Little.	Little improvement.	Hooper, *Tents of the Tuski* (1853); Dall, *Amer. Naturalist*, (1881). See Eskimo (Alaska).
FLATHEADS.	Salishan.	615 at Flathead Agency, Montana.	Considerable.	Continued Improvement. Catholic missions.	McDermott, *Journ. Amer. Folk-Lore*, 1901; Ronan, *Flathead Indians* (1890).
GOSIUTE.	Shoshonian.	About 200 in Utah.	Little.	Some improvement in last few years.	Chamberlin, *Proc. Acad. Nat. Sci. Phila.*, 1908. See Paiute, Ute.
GROSVENTRES (Atsina).	Algonkian.	558 at Ft. Belknap Agency, Montana.	Little.	Law-abiding, industrious and fast becoming more moral. Catholic, chief mission influence, also Presbyterian.	Kroeber, *Anthrop. Pap. Amer. Mus. Nat. Hist.*, 1907-1908.
HAIDA.	Haidan.	About 600 on Queen Charlotte Is., and 300 in Alaska. Decreasing.	Some little.	Now "gradually advancing along the lines of civilization." Mission influences Methodists and Anglican, with much success, especially former.	Swanton, *Contrib. to Ethnol. of the Haida* (1905) and other writings; Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1889; Newcombe, *Congr. intern. des Amér* (Quebec, 1906).
HANKUT'QIN.	Athabaskan.	About 400 on the Yukon, above the Kotlo, in Alaska.	Little, if any.	Not yet much under white or missionary influence.	See Babines.
HARES.	Athabaskan.	About 600 W. of Gt. Bear Lake to Eskimo country, in N.W. Canada.	Little.	"Wild and indolent," with little improvement. Reached by Catholic missions.	See Babines, Carriers, Chipewyan.
HAVASUPAI.	Yuman.	166 N. of Prescott in N.W. Arizona. Decreasing.	Little.	"Good workers"; not yet distinctly under mission influence.	James, *Indians of the Painted Desert Region* (Boston, 1903); Dorsey, *Indians of the South-west* (1903).
HIDATSA.	Siouan.	467 near Ft. Berthold, N. Dakota.	Little.	Making good progress. Congregational and Catholic missions.	Matthews, *Ethnogr. and Philol. of the Hidatsa* (1877); McGee, *15th Ann. Rep. Bur. Ethnol.*, 1893-1894; Pepper and Wilson, *Mem. Amer. Anthrop. Assoc.*, 1908.
HUPA.	Athabaskan.	420 in Hoopa Valley, N.E. California.	Little.	Self-supporting by agriculture and stock-raising. Presbyterian and Episcopal missions with good results.	Goddard, *Life and Culture of the Hupa* (1903), *Hupa Texts* (1904), and other writings.
HURONS OF LORETTE.	Iroquoian.	466 at Lorette, near the city of Quebec. Increasing, but losing somewhat by emigration.	No pure-bloods left.	Practically civilized. All Catholics, except one Anglican and six Presbyterians.	Gérin, *Rep. Brit. Assoc. Adv. Sci.*, 1900.
IOWA.	Siouan.	246 in Kansas; 88 in Oklahoma. Holding their own.	Considerable.	In 1906 "accomplished more on their allotments than at any time heretofore." One regular missionary.	Dorsey, *Trans. Anthrop. Soc. Wash.*, 1883, and *15th Ann. Rep. Bur. Ethnol.*, 1893-1894; also *11th Rep.*
IROQUOIS (of Caughnawaga).	Iroquoian.	2075 at Caughnawaga, in S.W. Quebec (largely Mohawk). Increasing.	Few, if any, pure-bloods left.	Practically civilized and making fair progress. Chiefly Catholics, but there is a Methodist school.	*Ann. Rep. Dept. Ind. Aff. Canada*, 1907.
IROQUOIS (of Lake of Two Mountains).	Iroquoian.	395 at Lake of Two Mountains, Quebec.	Few, if any, pure-bloods left.	Practically civilized and making fair progress. Catholics and Methodists represented.	Cuoq, *Lexique de la langue iroquoise* (1882), and other writings.
IROQUOIS (of St Régis).	Iroquoian.	1449 at St Régis, Quebec; 1208 at St Regis, New York.	Few pure-bloods left.	Practically all civilized and making fair progress.	*Ann. Rep. Dept. Ind. Aff. Canada*, 1907.
IROQUOIS (of Watha).	Iroquoian.	About 65 at Watha (formerly Gibson), near the southern end of Lake Muskoka, Ontario.	Considerable.	Industrious and progressive. Influence of Methodist mission.	*Ann. Rep. Dept. Ind. Aff. Canada*, 1907.
IROQUOIS (of St Albert).	Iroquoian.	94 near St Albert, Alberta ("Michel's band").	"Indians only in name," no pure-bloods left.	Practically civilized; outlook promising. Catholics.	Chamberlain, *Amer. Anthrop.*, 1904.
JICARILLA (Apache).	Athabaskan.	784 in New Mexico. Decreasing.	Little.	Improvement during past few years.	Mooney, *Amer. Anthrop.*, 1898. See Apache.
KAIBAB.	Shoshonian.	About 100 in S.W. Utah. Decreasing.	Little.	"Destitute," but gaining somewhat.	See Paiute, Ute.
KAIGANI.	Haidan.	About 300 in S. Alaska.	See Haida.	See Haida.	See Haida.
'KAIYUHKHO'TENNE	Athabaskan.	About 1500 on the Yukon (between the Anvik and Koyukuk) in W. Alaska.	Little.	Up to the present influenced more by the Eskimo than by the whites.	See Babines, Carriers. Also Chapman, *Congr. inter. d. Amér.* (Quebec, 1906).
KALAPOOIA.	Kalapuyan.	About 125 at Grande Ronde, Oregon, and a few also on the Siletz Reservation.	Not much.	Continued improvement.	Powell, *7th Ann. Rep. Bur. Ethnol.*, 1885-1886; Gatschet, *Journ. Amer. Folk-Lore*, 1899; Lewis, *Mem. Amer. Anthrop. Assoc.*, 1906.
KALISPEL (Pend d'Oreille).	Salishan.	826 on the Flathead Reservation, Montana; 98 at Colville Agency, Washington.	Considerable.	Continued improvement. Catholic missions.	Giorda, *Kalispel Dictionary* (1877-1879). See Chehalis.

Tribe.	Stock.	Situation, Population, &c.	Degree of Intermixture.	Condition, Progress, &c.	Authorities.
KANSA (Kaw).	Siouan.	207 in Oklahoma.	About half are mixed blood.	American citizens, making fair progress.	Dorsey, *11th Ann. Rep. Bur. Ethnol.*, 1889-1890, and *15th Rep.*, 1893-1894; Hay, *Trans. Kans. State Hist. Soc.*, 1906.
KICKAPOO.	Algonkian.	188 in Kansas; 204 in Oklahoma; about 400 in Mexico.	Considerable.	Progress hampered by liquor, &c.	Mooney, *14th Ann. Rep. Bur. Ethnol.*, 1892-1893; Lutz, *Trans. Kansas Hist. Soc.*, 1906.
KAWIA (Cahuilla).	Shoshonian.	About 150 in southern California.	Little.	Progress good. Nominally Catholics, result of Californian missions.	Barrows, *Ethnobotany of the Coahuilla Indians* (1900); Kroeber, *Ethnography of the Cahuilla* (1908).
KIOWA.	Kiowan.	1219 in Oklahoma.	Some white blood from captives, &c.	Citizens of the U.S., making fair progress. Catholic, Methodist, Presbyterian, &c., mission influences.	Mooney, *14th Ann. Rep. Bur. Ethnol.*, 1892-1893, and *17th Rep.*, 1895-1896.
KITKSAN.	Tsimshian.	About 1100 on upper Skeena river in central British Columbia.	Little.	Making good progress.	See Tsimshian.
KLAMATH.	Lutuamian.	761 at Klamath Agency, Oregon.	Little.	Mostly self-supporting. Methodist mission, but poor work done.	Gatschet, *The Klamath Indians* (Washington, 1890); Dorsey, *Amer. Anthrop.*, 1901.
KLICKATAT.	Sahaptian.	About 300 merged with Yakima and other tribes on Yakima Reservation, Washington.	Considerable.	Late reports indicate much bad influence of whites.	Lyman, *Proc. Amer. Antiq. Soc.*, 1904; Lewis, *Mem. Amer. Anthrop. Soc.*, 1906.
KONKAU (Concow).	Pujunan.	171 at Round Valley, California.	Little.	Gradually improving.	See Maidu.
KOOTENAY.	Kitunahan.	In S.E. British Columbia; 220 at St Mary's; 59 at Tobacco Plains; 82 at Columbia Lakes; 170, lower Kootenay. At Flathead Agency, Montana, 565. Holding their own, or increasing.	A little French and English.	Good, especially upper Kootenay; continued progress. Kootenay in U.S. not so progressive. Catholic missions with good results.	Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1889; Chamberlain, *ibid.*, 1892 (and other writings), *Ann. Arch. Rep. Ontario*, 1905; Schultz, *My Life as an Indian* (N.Y., 1907).
KOYUKUKHO'TENNE.	Athabaskan.	About 500 on the Koyukuk and Yukon above the 'Kaiyuhkho'tenne in Alaska.	Little, if any.	Little progress noted.	See Babines, Carriers, Chipewyan.
KWAKIUTL.	Wakashan.	About 2000 in Vancouver Island and British Columbia. Decreasing.	Considerable in places.	Improvement recently. Anglican and Methodist missions—former counting 469; latter, 19 members; rest, "pagans."	Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1889, 1890, 1896, *Rep. U.S. Nat. Mus.*, 1895, and other writings; Boas and Hunt, *Mem. Amer. Mus. Nat. Hist.*, 1902.
LILLOOET (Statliumh).	Salishan.	About 900 in S.W. British Columbia, on Fraser river, Douglas and Lillooet Lakes, &c.	Considerable places.	Getting along well generally. Catholic and Anglican missions.	Boas, *Ethnogr. Album* (N.Y., 1890); Hill-Tout, *Journ. Anthr. Inst.*, 1905; Teit, *Mem. Amer. Mus. Nat. Hist.*, 1906.
LUMMI.	Salishan.	418 at Tulalip Agency, Washington.	Considerable.	Suffering from white contact.	See Chehalis.
MAIDU.	Pujunan.	In N.E. California. About 250 full-bloods.	Not much.	Few and scattered.	Dixon, *Bull. Amer. Mus. Nat. Hist.*, 1902-1905; *Journ. Amer. Folk-Lore*, 1900-1907.
MAKAH.	Wakashan.	400 on Makah, 25 on Ozette Reservation, Washington.	Considerable.	Progress good.	Swan, *The Indians of Cape Flattery* (Washington, 1870); Dorsey, *Amer. Antiquarian*, 1901.
MANDAN.	Siouan.	264 at Ft. Berthold, N. Dakota. Beginning to increase again.	Considerable.	Making some progress. Catholic and Protestant mission influences.	Will and Spindle, *The Mandans* (1906); Dorsey in *11th* and *15th Reps. Bur. Ethnol.*
MARICOPA.	Yuman.	344 at Pima Agency Arizona. Decreasing slightly.	No data.	Progress in 1906 excellent. Catholic mission school.	See Yuma.
MASKEGON (Swampy Cree).	Algonkian.	About 2500 in Manitoba, Keewatin, Saskatchewan.	Considerable in certain regions.	Generally law-abiding, but improvident; some making good progress.	Simms in *Journ. Amer. Folk-Lore*, 1906; Stewart in *Ann. Arch. Rep. Ontario*, 1905.
MASSET.	Haidan.	360 at Masset, Q. Charlotte Is.	See Haida.	See Haida.	See Haida.
MENOMINEE.	Algonkian.	About 1600, of which 1364 under superintendency of Green Bay, Wisconsin.	Considerable.	Making gradual progress, with noticeable improvement in many respects. Catholic church has many members.	Hoffman in *14th Ann. Rep. Bur. Ethnol.*, 1892-1893.
MIAMI.	Algonkian.	129 in Oklahoma, 240 in Indiana, a few elsewhere; total about 400.	Considerable French blood, about 50 %.	American citizens; intelligent, thrifty and progressive.	Pilling, *Bibl. of Algon. Lang.* (1891).
MICMAC.	Algonkian.	2114 in Nova Scotia, 288 in Prince Edward Island, 1000 in New Brunswick, 591 in Quebec.	Large element of French; some Scottish and English blood.	Progress good; not degenerating nor decreasing. All Catholics.	Writings of Dr S. T. Rand, especially *Micmac Legends* (1894); Pacifique and Prince, *Congr. intern. des Amér.*, Quebec, 1906; Leland *Algonquin Legends* (1885); Leland and Prince, *Kuloskap* (1902).
MISSION INDIANS.	Yuman; Shoshonian.	About 3000 in S. California.	Considerable in some sections.	Self-supporting; some individuals remarkably able and industrious. Catholics nominally.	Writings of Miss C. G. du Bois, *Journ. Amer. Folk-Lore* and *Amer. Anthrop.*, 1900-1908, &c. See Kawia.
MISSISSAGUA.	Algonkian.	At Alnwick, 249; at the river Credit, 267; Rice Lake, 90; Mud Lake, 190; Scugog, 35. Increasing slightly.	Considerable.	Fairly good generally; some at the Credit very successful farmers, competing with whites. Methodists chiefly.	Chamberlain, *Journ. Amer. Folk-Lore*, 1888, and *Language of the Mississagas of Skugog* (Phila., 1892); Burnham, *Ont. Hist. Soc. Pap. and Rec.*, 1905.
MODOC.	Lutuamian.	52 in Oklahoma, 229 on Klamath Reservation, Oregon. Apparently decreasing slowly, or holding their own.	Little.	Generally industrious and moral. Methodist mission.	Miller, *My Life Among the Modocs* (1873); Gatschet, *Amer. Anthrop.*, 1894. See Klamath.
MOHAVE.	Yuman.	About 1600 in Arizona.	Little.	Good: industrious but restless. Presbyterian and Church of the Nazarene missions.	Bourke, *Journ. Amer. Folk-Lore*, 1889; Kroeber, *Amer. Anthrop.*, 1902. See Yuman.

Tribe.	Stock.	Situation, Population, &c.	Degree of Intermixture.	Condition, Progress, &c.	Authorities.
Mohawk.	Iroquoian.	1762 with Six Nations, Grand river, Ont., 1320, Bay of Quinte, Ont., slight increase. The "Iroquois" at Caughnawaga, &c., are largely Mohawks.	Considerable English and French.	See Six Nations.	Forbes, *Congr. intern. d. Amér.*, Quebec, 1906; Brant-Sero, *Man* (London, 1901). See Six Nations.
Montagnais.	Algonkian.	About 2000 in N.E. Quebec, N. shore of St Lawrence and St John, &c.	Large element of French blood.	At St John, "energetic, hard working and provident"; others suffering from liquor, &c. Catholic missions.	Chambers, *The Ouananiche* (1896); Chamberlain, *Ann. Arch. Rep. Ontario*, 1905; David, *Congr. int. d. Amér.*, Quebec, 1906.
Moqui (Hopi).	Shoshonian.	About 2000 in N.E. Arizona.	Little.	Still "pagan," but "dry-farming" experts. At Oraibi two factions, progressives and conservatives. Mennonite mission.	Bourke, *Snake Dance Among the Moquis* (1884); Hough, *Amer. Anthrop.*, 1898; Dorsey and Voth, *Field Columb. Mus. Publ.*, 1901-1902. Also the numerous monographs of Dr. J. W. Fewkes in *Rep. Bur. Ethnol. Amer. Anthrop.*, *Journ. Amer. Folk-Lore*, 1894-1908.
"Moravians."	Algonkian.	329 on river Thames, Ontario, Canada.	Considerable.	Generally industrious and very law-abiding. All Methodists.	*Ann. Rep. Dept. Ind. Aff. Canada*, 1907.
Munsee.	Algonkian.	118 on river Thames, Ontario, Canada; also a few with the Stockbridges in Wisconsin and the Chippewa in Kansas.	Considerable.	Fairly industrious; progress slow.	*Ann. Rep. Dept. Ind. Aff. Canada*, 1907.
Nahané.	Athabaskan.	About 1000 in N.W. British Columbia, N. and S. of Stikeen river, and E. to beyond the Rockies.	Not much.	Have suffered much from white contact. Reached by Catholic missions from Stuart Lake.	Writings of Petitot, Morice, &c., especially the latter in *Trans. Canad. Inst.*, 1894, *Proc. Canad. Inst.*, 1889. See Carriers.
Nascapee.	Algonkian.	Some 2500 in N.E. Quebec, Labrador, &c.	Not very much.	Improvement not marked. Catholic mission influence.	Turner, *11th Ann. Rep. Bur. Ethnol.*, 1889-1890; Chamberlain, *Ann. Arch. Rep. Ontario*, 1905.
Navaho.	Athabaskan.	About 29,000 in Arizona and New Mexico, about 8000 in the latter state. Increasing in number.	Much Spanish (Mexican) blood.	Have made remarkable progress racially and individually. Catholic, Presbyterian, &c., missions.	Writings of Dr. W. Matthews, especially *Navaho Legends* (Boston, 1897), *The Night Chant* (N.Y., 1902).
Nespelim.	Salishan.	191 at Colville Agency, Washington.	Considerable.	Suffering from liquor and white contact.	See Chehalis.
Nez Percés.	Sahaptian.	83 at Colville Agency, Washington, 1534 under Ft. Lapwai superintendency, Idaho. Decreasing.	Amount uncertain.	Of a high intellectual type (seen in children); suffering much from disease and white contact. About 60% Catholics and 15% Presbyterians.	Packard, *Journ. Amer. Folk-Lore*, 1891; McBeth, *The Nez Percés since Lewis and Clark* (New York, 1908); Spinden, *Mem. Amer. Anthrop. Assoc.*, 1908.
Nipissing.	Algonkian.	239 on Lake Nipissing, Ontario. Increasing.	Little.	Improving.	*Ann. Rep. Dept. Ind. Aff. Canada*, 1907.
Nipissino (Algonquins).	Algonkian.	About 60 at Lake of Two Mountains, Quebec.	Considerable.	Little marked progress; but fairly industrious. Catholics.	Writings of Rev. J. A. Cuoq, especially *Lexique algonquin* (Montreal, 1886); Lemoine, *Congr. inter. d. Amér.*, Quebec, 1906.
Niska (Nasqa).	Tsimshian.	About 800 in Nass river region in W. British Columbia. Decreasing.	Little.	Making good progress.	Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1895, 1896, and *Indianische Sagen* (Berlin, 1895). See Tsimshian.
Nisqualli.	Salishan.	146 in W. Washington.	Considerable.	Suffering from white contact, liquor, &c.	Gibbs, *Contrib. N. Amer. Ethnol.*, vol. i., 1877, and *Niskwalli Dictionary, ibid.*
Nootka.	Wakashan.	2133 (including Clayoquot) on Vancouver Island, B.C. Decreasing slowly.	Considerable in places.	Industrious and law-abiding; evil from white contact increasing. Catholic and Presbyterian missions.	Sproat, *Scenes and Studies of Savage Life* (1868); Boas, *Rep. Brit. Assoc.*, 1890, and *Indianische Sagen* (1895).
Okanagan.	Salishan.	824 in the Kamloops-Okanagan Agency, British Columbia; 527 on Colville Reservation, Washington.	Considerable in places.	Industrious and law-abiding. Catholic, and in Canada Catholic and Anglican churches largely represented.	Boas, *Rep. Brit. Assoc.*, 1889; Teit, *Mem. Amer. Mus. Nat. Hist.*, 1900.
Omaha.	Siouan.	1128 in Nebraska.	Much white blood.	Good progress in many respects; improvidence, &c., still causing trouble. Presbyterian mission.	Dorsey, *3rd Ann. Rep. Bur. Ethnol.*, 1881-1882, and *13th Rep.*, 1891-1892, and other writings. Also writings of Miss A. C. Fletcher. See Ponca.
Oneida.	Iroquoian.	777 on river Thames, Ontario, and 350 with Six Nations in Ontario; 2151 in Wisconsin; 286 in New York. Increasing.	Large element of white blood.	Canadian Oneidas at Delaware full citizens. All progressing excellently and self-supporting. U.S. Oneidas citizens.	Bloomfield, *The Oneidas* (N.Y., 1907). See Six Nations.
Onondaga.	Iroquoian.	350 with the Six Nations, Ontario; 553 in New York.	Large element of white blood.	Not so advanced in U.S. as Tuscarora.	Clark, *Onondaga* (Syracuse, 1849); writings of Beauchamp, de Cost Smith, M. R. Harrington, &c. See Six Nations.
Osage.	Siouan.	1994 in Oklahoma.	Very much white blood; half are mixed-bloods.	U.S. citizens and making good progress. Baptists and Catholics represented.	Dorsey (J. O.), *6th Ann. Rep. Bur. Ethnol.*, 1884-1885; Brewster, *Trans. Kans. State Hist. Soc.*, 1906; Dorsey (G. A.), *Publ. Field Columb. Mus.*, 1904; Speck, *Trans. Arch. Dept. Univ. of Penn.* (Phila., 1907).
Oto.	Siouan.	About 390 with the Missouri in Oklahoma.	Considerable.	Making good progress.	See Osage.
Ottawa.	Algonkian.	About 750 on Manitoulin and Coburn Islands, Ontario; 2750 in Michigan; 197 in Oklahoma.	Considerable French and English blood.	Canadian Ottawa industrious and law-abiding, and many in the U.S. as civilized as average whites about them. Catholic and Protestant missions.	Blackbird, *Ottawa and Chippewa Indians* (1887). See Pilling's *Bibliography of the Algonkian Languages*, 1891.
Paiute.	Shoshonian.	6500 to 7000 chiefly in Nevada (about 600 in Utah; 350 in Arizona).	No data.	Peaceable, moral and industrious; "have steadily resisted the vices of civilization." Catholic and Protestant missions.	Mooney in *14th Ann. Rep. Bur. Ethnol.*, 1892-1893. See Ute.

Tribe.	Stock.	Situation, Population, &c.	Degree of Intermixture.	Condition, Progress, &c.	Authorities.
Pamunkey.	Algonkian.	About 140 in King William county, Virginia.	All mixed-bloods; some negro mixture.	Fishermen and small farmers.	Pollard, *The Pamunkey Indians of Virginia* (Washington, 1894).
Panamint.	Shoshonian.	About 100 in the Panamint Valley, S.E. California.	No data.	Stationary.	Coville, *Amer. Anthrop.*, 1892.
Papago.	Piman.	4991 in Arizona; about 1000 in Mexico.	Little.	Making very good progress recently. Catholic mission.	McGee in Coville and Macdougal, *Des. bot. lab.*, 1903; Bandelier, *Arch. Inst. Papers*, 1890. See Pima.
Passamaquoddy.	Algonkian.	About 350 in Maine.	Considerable French and English.	With Penobscots have representative in Maine legislature.	Leland, *Algonq. Leg. of New England* (Boston, 1885); Brown, *Trans. R. Soc. Canada*, 1889; Prince, *Proc. Amer. Philos. Soc.*, 1897; Leland and Prince, *Kuloskap* (Boston, 1902).
Pawnee.	Caddoan.	649 in Oklahoma. Decreasing.	Considerable.	Citizens of U.S. Special progress recently in agriculture. Methodist mission.	Writings of Dunbar, Grinnell, Dorsey, Fletcher, &c.; Grinnell, *Pawnee Hero-Stories* (1889); Dorsey, *Traditions of the Skidi Pawnee* (Boston, 1904), and *Pawnee Mythology* (1906); Fletcher, *22nd Ann. Rep. Bur. Ethnol.*, 1900-1901.
Penobscot.	Algonkian.	About 410 in Maine.	Considerable.	See Passamaquoddy.	See Passamaquoddy.
Peoria.	Algonkian.	192 with Kaskaskia, Wea and Piankaskaw in Oklahoma.	No pure-bloods left.	American citizens and progressing well.	See Pilling, *Bibliography of the Algonquian Languages* (1891).
Piegan.	Algonkian.	482 near Macleod, Alberta; 2072 at Blackfoot Agency, Montana.	Considerable.	Improvement slow in Montana; in Alberta, "noticeable advance along all lines." Methodist and Anglican missions in Alberta.	See Blackfeet.
Pima.	Shoshonian.	3936 in Arizona; more in Mexico. Increasing slightly.	Considerable.	Making good progress recently. Catholic and Protestant missions.	Russel, *Amer. Anthrop.*, 1903, *Journ. Amer. Folk-Lore*, 1901, and *26th Ann. Rep. Bur. Amer. Ethnol.*, 1904-1905; Dorsey, *Indians of the South-west* (1903); *Hrdlicka*, *Amer. Anthrop.*, 1904; Kroeber, *Univ. Calif. Publ.*, 1907.
Pomo.	Kulanapan.	About 1000 in N.E. California.	Little.	Progress good.	Barrett, *Ethnography of the Pomo* (1908).
Ponca.	Siouan.	570 in Oklahoma.	Considerable.	U.S. citizens, making good progress.	Dorsey (J. O.), *Cegiha Language* (1890), *Omaha and Ponka Letters* (1891), &c.; Dorsey (G. A.), *Field Columb. Mus. Publ.*, 1905; Boas, *Congr. int. d. Amér.*, Quebec, 1906.
Potawatomi.	Algonkian.	179 on Walpole Island, Ontario; 1740 in Oklahoma.	Considerable.	Canadian Potawatomi are law-abiding and industrious. American Potawatomi citizens making progress.	See Pilling, *Bibliography of the Algonquian Languages* (1891).
Pueblos.	Keresan.	3990 in 6 pueblos in N. central New Mexico.	Larger element of white blood than other Pueblos Indians, but not great.	Majority nominally Catholics.	Writings of Bandelier, Hodge, Lummis, Stevenson, &c. Stevenson, *11th Ann. Rep. Bur. Ethnol.*, 1889-1890; Dorsey, *Indians of the South-west* (1903); Bandelier, *Archaeol. Inst. Papers*, 1881, 1883, 1892.
Pueblos.	Shoshonian.	See Moqui.	See Moqui.	See Moqui.	See Moqui.
Pueblos.	Tanoan.	About 4200 in 12 pueblos in New Mexico.	Have not favoured intermixture. Amount little.	Nominally Catholics for most part. At San Juan notable evidences of thrift, less elsewhere.	Writings of Bandelier, Lummis, Fewkes, &c. See Pueblos (Keresan) and Moqui.
Pueblos.	Zuñian.	1500 in Western New Mexico.	Have not favoured white intermixture.	Practically all are "pagans." Substantial progress lately in several ways.	Bandelier, *Journ. Amer. Ethnol. and Archaeol.*, 1892; Fewkes, *ibid.*, 1891; Stevenson, *5th Ann. Rep. Bur. Ethnol.*, 1883-1884, and *23rd Rep.*, 1901-1902; Cushing, *2nd Rep.*, 1880-1881, *4th Rep.*, 1882-1883, *13th Rep.*, 1891-1892, and *Zuñi Folk-Tales* (N.Y., 1901), and other writings.
Puyallup.	Salishan.	486 at the Puyallup Agency, Washington.	Considerable.	Suffering from white contact; future not bright.	See Chehalis.
Quapaw.	Siouan.	292 in Oklahoma.	Considerable.	Majority are intelligent, thrifty and progressive. Catholic missions.	Dorsey (J. O.), *11th Ann. Rep. Bur. Ethnol.*, 1889-1890, *13th Rep.* 1891-1892, and other writings.
Quileute.	Chemakuan.	232 at Neah Bay Agency, N.W. Washington.	Considerable.	Progress good.	See Clallam.
Quinaielt.	Salishan.	142 at Puyallup Agency in N.W. Washington.	Considerable.	See Nisqualli.	Farrand, *Mem. Amer. Mus. Nat. Hist.*, 1902; Conard, *Open Court*, 1905.
Sacs and Foxes (Sauk, &c.).	Algonkian.	343 in Iowa; 630 in Oklahoma; 90 in Kansas.	Considerable.	Continued improvement; conservative opposition less. Catholic missions.	Lasley, *Journ. Amer. Folk-Lore*, 1902; Jones, *ibid.*, 1901, and *Fox Texts* (1907); Owen, *Folk-Lore of the Musquaki* (1904).
Sanspoil.	Salishan.	126 at Colville Agency, Washington.	Considerable.	Improving.	See Chehalis.
Sarcee.	Athabaskan.	205 S.W. of Calgary, Alberta.	More than many other tribes of this stock.	Making good material progress lately. Anglican mission.	Maclean, *Canad. Savage Folk* (1890); Goddard, *Congr. int. d. Amér.*, 1906; Morice, *ibid.* and *Ann. Arch. Rep. Ontario*, 1905; Simms, *Journ. Amer. Folk-Lore*, 1904.
Sekané (Sikani).	Athabaskan.	About 450 on Finlay and Parsnip rivers and W. to forks of Tatla Lake in N. central British Columbia.	Little.	Not so progressive as Carriers &c. Reached by Catholic mission from Stuart Lake.	Morice, *Anthropos*, 1906, 1907, and *Ann. Arch. Rep. Ontario*, 1905, and other writings. See Babines, Carriers.

Tribe.	Stock.	Situation, Population, &c.	Degree of Intermixture.	Condition, Progress, &c.	Authorities.
SEMINOLE.	Muskogian.	2132 in Oklahoma; 350 in Florida.	Much white and some negro blood.	Oklahoma Seminoles American citizens.	MacCauley, *5th Ann. Rep. Bur. Ethnol.*, 1887; Coe, *Red Patriots* (1898). See Creek.
SENECA.	Iroquoian.	383 in Oklahoma; 2742 in New York; 215 with Six Nations, on Grand river, Ontario.	Considerable.	See Six Nations.	Sanborn, *Seneca Indians* (1862); Hubbard, *An Account of Sa-go-ye-wat-ha, or Red Jacket and his People* (Albany, 1886). See Six Nations.
SHAWNEE.	Algonkian.	574 in Oklahoma.	Considerable.	Progress good. Catholic and Protestant missions.	See Pilling, *Bibl. of Algon. Lang.* (1891). Also Harvey, *Shawnee Indians* (1855).
SHOSHONEE.	Shoshonian.	About 1000 in Idaho; 242 in Nevada; 793 in Wyoming.	Amount of admixture not large.	Progress good in the last few years. Catholic and Protestant Episcopal missions.	Culin, *Bull. Free Mus. Sci. and Art* (Phila., 1901); Dorsey, *Indians of the South-west* (1903). See Ute.
SHUSWAP (Sequapamuq).	Salishan.	About 1000 in the S. interior of British Columbia; also 52 within the Kootenay area at the Columbia Lakes.	Considerable in places.	Industrious and law-abiding. Catholic and Protestant missions.	Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1890, and *Ethnogr. Album* (N.Y., 1900); Dawson, *Trans. Roy. Soc. Canada*, 1891; Boas, *Indianische Sagen* (1895).
SILETZ.	Indians of several stocks.	483 on Siletz Reservation, Oregon.	Considerable.	Progress good.	Dorsey, *Journ. Amer. Folk-Lore*, 1890, and *Amer. Anthrop.*, 1889.
SIX NATIONS (Canada).	Iroquoian.	On Grand River Reservation, Ontario; Cayuga, 1044; Mohawk, 1762; Oneida, 350; Onondaga, 350; Seneca, 215; Tuscarora, 397. Total, 4118.	Large admixture of white blood.	Generally capable and industrious, and steadily improving; many, both in U.S. and Canada, equal to whites. The Canadian Cayuga and Onondaga are "pagans." Many Christian faiths represented.	Boyle, *Ann. Arch. Rep. Ontario*, 1898 and 1905, and *Journ. Anthr. Inst.*, 1900; Hale, *Iroquois Book of Rites* (Phila., 1883); Wilson, *Trans. Roy. Soc. Can.*, 1885. See also under tribal names.
SIX NATIONS (New York).	Iroquoian.	In New York State; Cayuga, 179; Oneida, 286; Onondaga, 553; Seneca, 2742; Tuscarora, 356. Total, 4116.	Large admixture of white blood.	Improvement varying with tribes; Tuscarora said to be best. Various religious faiths.	Beauchamp, *Bull. N.Y. State Mus.*, 1897-1907, *The Iroquois Trail* (1892), and other writings; Smith, *2nd Ann. Rep. Bur. Ethnol.*, 1880-1881; Hewitt, *21st Ann. Rep. Bur. Ethnol.*, 1899-1900, and other writings. See also under tribal names.
SK.QOMIC.	Salishan.	About 150 in the Howe Sd. and Burrard Inlet region of British Columbia.	Some Canadian-French admixture.	"Probably the most industrious and orderly band of Indians in the province." Catholic mission.	Hill-Tout, *Rep. Brit. Assoc. Adv. Sci.*, 1900; Boas, *ibid.*, 1894.
SLAVÉ.	Athabaskan.	About 1100 in the region W. of Gt. Bear Lake, from Ft. Simpson to Ft. Norman in N.W. Canada.	No certain data; but some admixture now going on.	No marked progress, but white influence being felt. Catholics and Episcopal missions.	Various writings of Petitot and Morice; the latter in *Anthropos*, 1906-1907; Bompas, *Mackenzie River* (London, 1888); Bell, *Journ. Amer. Folk-Lore*, 1901.
SNAIMUQ (Nanaimo).	Salishan.	About 160 on reserve near Nanaimo Harbour, B.C.	No data.	Making good progress recently. Catholic mission.	Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1889, and *Amer. Anthrop.*, 1889.
SONGISH (Lkungen).	Salishan.	About 200 in S.E. Vancouver Island, B.C.	No data.	Industrious and mostly well-off. Catholic mission.	Boas, *Rep. Brit. Assoc.*, 1890; Hill-Tout, *Journ. Roy. Anthrop. Inst.*, 1907.
SPOKAN.	Salishan.	91 in Idaho; 133 in Montana; 434 in Washington.	Considerable.	Improving.	Writings of Rev. M. Eells. See Chehalis.
TAHLTAN.	Athabaskan.	220 in the N. Interior of British Columbia, at mouth of Tahltan river.	Little.	Making good progress.	Teit, *Boas Anniv. Vol.* (N.Y., 1906).
TEN'A.	Athabaskan.	About 2000 on the Yukon, between Tanara and Koserefsky in Alaska.	Little.	Not yet much influenced by whites. Catholic mission.	Jetté, *Congr. int. des Amér.* 1906; *Man*, 1907; *Journ. Anthr. Inst.*, 1907.
THOMPSON INDIAN (Ntlakapamuk).	Salishan.	About 1770 in the Thompson river region, S. central British Columbia.	Not very much.	Making good progress. Catholic and Protestant missions.	Teit and Boas, *Mem. Amer. Mus. Nat. Hist.*, 1900; Teit, *Trad. of Thompson Inds.* (Boston, 1898); Hill-Tout, *Salish and Dêné* (London, 1907).
TLINGIT.	Koluschan.	About 2000 in S. Alaska.	Considerable in places.	Not marked generally. Greek Orthodox and other missions.	Krause, *Die Tlinkit Indianer* (Berlin, 1885); Boas, *Indianische Sagen* (Berlin, 1905); Bogoras, *Amer. Anthrop.*, 1902; Swanton, *26th Ann. Rep. Bur. Amer. Ethnol.*, 1904-1905; Emmons, *Mem. Amer. Mus. Nat. Hist.*, 1903.
TONKAWA.	Tonkawan.	47 in Oklahoma.	No data.	"Contented and enjoying life."	Mooney, *Globus*, 1902.
TSIMSHIAN (Proper).	Tsimshian.	About 2000 in northern British Columbia.	Not large.	Making good progress. Anglican and other missions.	Boas, *Rep. Brit. Assoc. Adv. Sci.*, 1889, and *Indianische Sagen* (Berlin, 1895); von der Schulenburg, *Die Sprache der Zimshian-Indianer* (1894); Wellcome, *Metlakatla* (1887).
TUSCARORA.	Iroquoian.	397 on Six Nation Reservation, Ontario; 356 with Six Nations, New York.	Considerable.	Making good progress in both Canada and New York.	See Six Nations.
TUTCHONEKUT'QIN.	Athabaskan.	About 1000 on the Yukon from Deer river to Ft. Selkirk, in Alaska.	Little.	Little progress.	See Babines, Carriers, Chipewyan.
UINTA UTE.	Shoshonian.	435 in Utah.	Little.	See Ute.	See Ute.
UMATILLA.	Sahaptian.	207 in Oregon.	Some.	Making progress. Catholic and Presbyterian missions.	See Nez Percés.
UNCOMPAGHRE UTE.	Shoshonian.	493 in Utah.	Little.	See Ute.	See Ute.
UTE.	Shoshonian.	845 in Colorado; 1245 in Utah.	Not much.	Some progress recently. Catholic and Protestant missions.	Culin, *Bull. Free Mus. Sci. and Art* (Phila., 1901); Kroeber, *Journ. Amer. Folk-Lore*, 1901, and *Amer. Anthrop.*, 1906.

Tribe.	Stock.	Situation, Population, &c.	Degree of Intermixture.	Condition, Progress, &c.	Authorities.
WALAPAI.	Yuman.	513 in Arizona. Decreasing.	Little.	Self-supporting, but poor morally.	James, *Indians of the Painted Desert Region* (Boston, 1903).
WALLAWALLA.	Sahaptian.	579 in Oregon.	Some.	Not so satisfactory recently, but progressing.	See Nez Perces.
WICHITA.	Caddoan.	441 in Oklahoma.	Probably considerable.	Citizens of U.S., making good progress. Catholic and Protestant missions.	Dorsey, *Mythology of the Wichita* (Washington, 1904) and other writings.
WINNEBAGO.	Siouan.	1070 in Nebraska; 1285 in Wisconsin.	Considerable.	Many good citizens of U.S. and progressing. Suffering from liquor and the mescal bean to some extent.	Thwaites, *Coll. State Hist. Soc. Wisconsin*, 1892; Fletcher, *Journ. Amer. Folk-Lore*, 1890; McGee, *15th Ann. Rep. Bur. Ethnol.*, 1893-1894.
WYANDOT.	Iroquoian.	385 in Oklahoma; 1 at Anderdon, Ontario, Canada.	No pure-bloods left, hardly a half-blood.	More white than Indian.	Powell, *1st Ann. Rep. Bur. Ethnol.*, 1879-1880; Connelley, *Ann. Arch. Rep. Ontario*, 1905, and *Wyandot Folk-Lore* (Topeka, 1899); Merwin, *Trans. Kansas State Hist. Soc.*, 1906.
YAKIMA.	Sahaptian.	About 1500 in Washington.	Considerable.	Late reports indicate bad influence of whites.	Pandosy, *Gramm. and Dict. of Yakima* (1862); Lewis, *Mem. Amer. Anthrop. Assoc.*, 1906.
YELLOWKNIVES.	Athabaskan.	About 500 N.E. of Great Slave Lake in N.W. Canada.	Not much.	No practical advance as yet.	Writings of Petitot, Morice, &c. Petitot, *Antour du Grand Lac des Esclaves* (1891), and *Monographie des Déné-Dindjié* (1876). See Carriers, Chipewyan.
YUMA.	Yuman.	807 at Fort Yuma Agency, California, and a few at San Carlos, Arizona.	Some Spanish (Mexican) blood.	Progress good. Catholic and Protestant missions.	Gatschet, *Ztschr. f. Ethnologie* (1893); Trippell, *Overland Monthly*, 1889; Dorsey, *Indians of the South-west* (1903). See Mission Indians.
ZUÑI.	Zuñian.	See Pueblos.	Zuñian.	See Pueblos.	See Pueblos (Zuñian).

Population, &c. From the tables it will be seen that the American Indians in some parts of North America are not decreasing, but either holding their own or even increasing; also that thousands of them are now to all intents and purposes the equals in wealth, thrift, industry and intelligence of the average white man and citizens with him in the same society. In certain regions of the continent small tribes have been annihilated in the course of wars with other Indians or with the whites, and others have been decimated by disease, famine, &c.; and over large areas the aboriginal population, according to some authorities, has vastly diminished. Thus Morice estimates that the Athabaskan population at present in Canada (about 20,000) is less than one-seventh of what it was a century or more ago; Hill-Tout thinks the Salishan tribes (*c.* 15,000) number not one-fifth of their population a hundred years ago, and equally great reductions are claimed for some other peoples of the North Pacific region; Kroeber thinks probable an Indian population in California of 150,000 before the arrival of the whites, as compared with but 15,000 now; by some the arid regions of the south-west are supposed to have sustained a very large population in earlier times; certain of the Plains tribes are known to have lost much in population since contact with the whites. But under better care and more favourable conditions generally some tribes seem to be taking on a new lease of life and are apparently beginning to thrive again. A considerable portion of the "disappearance" of the Indian is through amalgamation with the whites. Undoubtedly, in some parts of the country, exaggerated ideas prevalent in the early colonial period as to the numbers of the native population have interfered with a correct estimate of the aborigines past and present. Mooney thinks that the Cherokee "are probably about as numerous now as at any period in their history" (*Hndb. Amer. Inds.*, 1907, pt. i. p. 247), and this is perhaps true also of some other tribes east of the Mississippi. Major J. W. Powell was of opinion that the Indian population north of Mexico is as large to-day as it was at the time of the discovery. This, however, is not the view of the majority of authorities. The total number of Indians in Canada (*Ann. Rep. Dept. Ind. Aff.*, 1907) for 1907 is given as 110,345, as compared with 109,394 for the previous year, not including the Micmac in Newfoundland and the Indians and Eskimo in that part of Labrador belonging to Newfoundland. In 1903 the figures were 108,233. The gain may be largely due to more careful enumeration of Indians in the less well-known parts of the country, but there is evidently no marked decrease going on, but rather a slight increase in Ontario, Quebec, New Brunswick, &c. In the United States (exclusive of Alaska, which counts about 30,000) the Indian population (*Ann. Rep. Ind. Aff.*, 1906) is estimated at 197,289, no including the "Five Civilized Tribes," of whose numbers (94,292) some 65,000 can be reckoned as Indians—a total of 382,000. The figures of 197,289, according to the report, show an increase in population "due mainly to increase in number of Indians reported from California."

The financial condition of the Indians of the Dominion of Canada for the year ending March 31, 1907, is indicated in the following table:—

	Total Amount of Real and Personal Property.	Total Income for the Year.
Ontario . . .	$7,566,125	$1,426,690
Quebec . . .	1,781,330	915,783
N. Brunswick .	189,701	109,892
N. Scotia . .	151,949	76,603
P. E. I. . . .	6,370	15,374
Manitoba . .	2,102,044	348,966
B. Columbia .	7,475,719	1,501,456
Sask	7,721,532	548,533
Alberta . . .	5,154,789	211,839
Total .	$30,129,659	$5,155,052

The total amounts earned during the year were: from agriculture, $1,337,948; wages and miscellaneous industries, $714,125; fishing, $544,487; hunting and trapping, $630,633. Of these hunting and trapping show a decided decrease over 1906. The Indian Trust Fund amounts to $5,157,566·59. The total appropriation in connexion with the Indians of the Dominion for all purposes for the year 1906–1907 was $1,055,010 and the actual expenditure some $114,000 less. The total amount of sales of lands for the benefit of Indian tribes was $422,086·13. The balance to the credit of the Indian savings account for the funding of the annuities and earnings of pupils at industrial schools, together with collections from Indians for purchase of cattle and for ranching expenses, was $51,708·92.

According to the *Report of the Commissioner of Indian Affairs* the total amount of trust funds held by the United States government for the Indians, in lieu of investment, amounted to $36,352,950·97, yielding for 1906 interest at 4 and 5% of $1,788,237·23. The total incomes of the various tribes from all sources for the year ending June 30, 1906, was $6,557,554·39, including interest on trust funds, treaty agreement and obligations, gratuities, Indian money, proceeds of labour, &c.

While the general constitution of the American aborigines north of Mexico is such as to justify their designation as one "American race," whose nearest congener is to be found in the "Mongolian race" of eastern Asia, &c., there is a wide range in variation within the American tribes with respect to particular physical characteristics. Some authorities, like Dr Hrdlička (*Handb. Amer. Inds. N. of Mex.*, 1907, pt. i. p. 53), separate the Eskimo from the "Indians," regarding them as "a distinct sub-race of the Mongolo-Malay," but this is hardly necessary if, with Boas (*Ann. Archaeol. Rep. Ontario*, 1905, p. 85), we "consider the inhabitants of north-eastern Asia and of America as a unit divided into a great many distinct types but belonging to one and the same of the large divisions of mankind." Upon the basis of differences in stature and general bodily conformation, colour of skin, texture and form of hair, shape of nose, face and head, &c., some twenty-one different physical "types" north of Mexico have been recognized.

Physical characteristics.

Although the variation in stature, from the short people of Harrison Lake (average 1611 mm.) to the tall Sioux (average 1726 mm.), Eastern Chippewa (average 1723 mm.), Iroquois (average 1727 mm.), Omaha and Winnebago (average 1733 mm.) and other tribes of the Plains and the regions farther east, is considerable, the North American Indian, on the whole, may be termed a tall race. The stature of women averages among the tall tribes about 92%, and among the short tribes about 94% of that of the men.

The proportion of statures (adult males) above 1730 mm. in certain Indian tribes (Boas) is as follows: Apache and Navaho, 25·3; Arapaho, 45·9; Arikara, 15·2; British Columbia (coast), 28·8; British Columbia (interior), 16·4; California (south), 32·7; Cherokee (eastern), 21·0; Cherokee (western), 40·7; Cheyenne, 72·2; Chickasaw, 23·8; Chinook, 36·2; Choctaw, 32·6; Coahuila, 14·2; Comanche, 27·1; Cree, 33·4; Creek, 53·6; Crow, 51·3; Delaware, 41·1; Eskimo (Alaska), 5·9; Eskimo (Labrador), 0·0; Flathead, 18·9; Harrison Lake, B.C., 1·0; Hupa, 18·7; Iroquois, 52·1; Kiowa, 41·3; Klamath, 20·0; Kootenay, 26·0; Micmac and Abnaki, 45·7; Ojibwa (eastern), 42·7; Ojibwa (western), 42·7; Omaha and Winnebago, 54·9; Oregon (south), 5·1; Ottawa and Menominee, 30·6; Paiute, 22·1; Pawnee, 39·0; Puget Sound and Makah, 6·5; Round Valley, Cal., 3·3; Sahaptin, 28·2; Shuswap, 15·9; Sioux, 50·8; Taos, 18·5; Ute, 12·4; Zuñi and Moqui, 1·9.

Very notable is the percentage of tall statures among the Cheyenne, Creek, Crow, Iroquois, &c. The form of the head (skull) varies considerably among the Indian tribes north of Mexico, running from the dolichocephalic eastern Eskimo with a cephalic index of 71·3 on the skull to the brachycephalic Aleuts with 84·8. Several tribes practising deformation of the skull (mound-builders, Klamath, &c.) show much higher brachycephaly.

The percentage of cephalic indices above 84 (on the heads of living individuals) among certain Indian tribes (Boas) is as follows: Apache, 87·6; Arapaho, 5·0; Arikara, 24·6; Blackfeet, 6·2; Caddo, 47·2; Cherokee, 20·0; Cheyenne, 10·4; Chickasaw, 14·4; Comanche, 65·3; Cree, 4·9; Creek, 25·0; Crow, 12·0; Delaware 12·0; Eskimo, (Alaska), 10·6; Harrison Lake, B.C., 88·8; Iroquois, 15·4; Kiowa, 25·0; Kootenay, 19·1; Mandan, 4·5; Micmac and Abnaki, 7·0; Mohave, 86·5; Montagnais, 21·7; Moqui, 54·3; Navaho, 49·4; Ojibwa (eastern), 26·6; Ojibwa (western), 10·2; Omaha, 23·0; Oregon (south), 50·9; Osage, 79·1; Ottawa and Menominee, 24·7; Pawnee, 4·8; Pima, 9·6; Round Valley, Cal., 4·8; Sahaptin, 57·4; Shuswap, 59·9; Sioux, 9·6; Taos, 6·0; Ute, 8·9; Wichita, 96·0; Winnebago, 66·8; Zuñi, 41·4.

The Apache, Mohave, Navaho, Osage, Sahaptin, Wichita and Winnebago practised skull-deformation, which accounts in part for their high figures. The brachycephalic tendency of the Caddo, Moqui, Shuswap and Zuñi is marked; the Comanche, with an average cephalic index of 84·6 and the Harrison Lake people with one of 88·8, are noteworthy in this respect. As in the case of stature, so in the case of head-form, there seems to have been much mingling of types, especially in the Huron-Algonkian region, the Great Plains and the North Pacific coast.

The North American Indian may be described in general as brown-skinned (of various shades, with reddish tinge, sometimes dark and chocolate or almost black in colour) with black hair and eyes varying from hazel brown to dark brown. Under good conditions of food, &c., the Indian tends to be tall and mesocephalic as to head-form, and well-proportioned and symmetrical in body. The ideal Indian type can be met with among the youth of several different tribes (Plains Indians, Algonkians, Iroquoians, Muskogians and some of the tribes of the south-western United States). Beauty among the aborigines of America north of Mexico has been the subject of brief studies by Dr R. W. Shufeldt and Dr A. Hrdlička (*Boas Anniv. Vol.*, New York, 1906, pp. 38-42).

The extent to which the red and white races have mixed their blood in various parts of North America is greater than is generally thought. The Eskimo of Greenland have intermarried with the Danes, and their kinsmen of Labrador with the English settlers and "summerers." The eastern Algonkian Indians in New England and Acadia have now considerable French, English and Scottish blood. Many of the Canadian Iroquois are more than half French, many of the Iroquois of New York half English. The Cherokee, an Iroquoian people of the Carolinas, have some admixture of Scottish and German blood, to which Mooney would attribute some, at least, of their remarkable progress. In the state of Oklahoma, which has absorbed the old "Indian Territory," the results of race-amalgamation are apparent in the large number of mixed bloods of all shades. In spite of the romance of Pocahontas, the intermarriages of the two races in the Virginian region seem not to have been very common or very important. Nor does there appear to have been much intermarriage between Spaniards and Indians in the south Atlantic region, though in Texas, &c., there was a good deal. In New France, in spite of the efforts of some recent Canadian-French writers to minimize the fact, intermixture between whites and Indians began early and continued to be extensive. In parts of New Brunswick, Quebec, Ontario, some of the northern American states and regions of the Canadian north-west, there are Indian villages and white settlements where hardly a single individual of absolutely pure blood can now be found. In the veins of some of the "Iroquois" of Caughnawaga and New York state to-day flows blood of the best colonial stock (Rice, Hill, Williams, Stacey, &c., captives adopted and married within the tribe). In the great Canadian north-west, and to a large extent also in the tier of American states to the south, the blood of the Indian, through the mingling of French, Scottish and English traders, trappers, employees of the great fur companies, pioneer settlers, &c., has entered largely and significantly into the life of the nation, the half-breed element playing a most important rôle in social, commercial and industrial development.

Race mixture.

In 1879, besides those whose mixed blood had not been remembered and those who wished to forget it, there were, according to Dr Havard (*Rep. Smiths. Inst.*, 1879), at least 22,000 *mêtis* in the United States and 18,000 in Canada (*i.e.* in the north-west in each case). When the province of Manitoba entered the Canadian Confederation it numbered within the borders some 10,000 mixed-bloods, one of whom, John Norquay, afterwards became its premier. In the Columbia river region and British Columbia some intermixture has taken place, originating in the conditions due to the establishment of trading-posts, the circumstances of the early settlement of the country, &c.—this has been both French and English and Scottish. Farther north in Alaska the Russian occupation led to not a little intermixture, both with the Aleuts, &c., and the coast Indians. In some parts of the far north intermixture of the whites with the Athabaskans is just beginning. In Canada no prohibition of marriage between whites and Indians exists, but such unions are forbidden by law in the states of Arizona, Oregon, North Carolina and South Carolina.

A considerable number of the chiefs and able men of the various Indian tribes of certain regions in recent times have had more or less white blood—Iroquois, Algonkian, Siouan, &c.—who have sometimes worked with and sometimes against the whites. In the case of some tribes there have been "pure blood" and "mixed blood" factions. Some tribes have frowned upon miscegenation; even the Pueblos (except Laguna, which is Keresan) have never intermarried with the whites. Both in Canada and the United States strains of Indian blood run in the veins of prominent families. Some of the "first families of Virginia" are proud to descend from Pocahontas, the Algonkian "Princess," who married the Englishman Rolfe. In Maine may still be discovered perhaps those whose line of life goes back to the Baron de St Casteins and his Abnaki bride, while in Ontario and New York are to be met those who trace their ancestry back to the famous Iroquois Joseph Brant and his half-English wife. In the early history of Pennsylvania and Ohio were noted the Montours, descendants of a French nobleman who about

1665 had a son and two daughters by a Huron woman in Canada. In 1817 Captain John S. Pierce, U.S.A., brother of President Franklin Pierce, married the fair Josette la Framboise, who had at least a quarter Indian (Ottawa) blood. In the latter part of the 18th century a young Irish gentleman married Neengai, daughter of the Michigan Ojibwa chief Waubojeeg, and of the daughters born to them one married a Canadian Frenchman of reputation in the early development of the province of Ontario, another the Rev. Mr McMurray, afterwards Episcopal archdeacon of Niagara, and a third Henry R. Schoolcraft, the ethnologist.

Several Indians, some full-blood, others with more or less white blood in their veins, have rendered signal service to ethnological science. These deserve special mention: Francis la Flesche, an Omaha, a graduate of the National Law School at Washington, D.C., holding a position in the Office of Indian Affairs; Dr William Jones, a Sac and Fox, in the service of the Field Museum, Chicago, a graduate of Harvard and of Columbia (Ph.D.); and J. N. B. Hewitt, a Tuscarora, ethnologist in the Bureau of American Ethnology, Washington, D.C. In some regions considerable intermixture between negroes and Indians (*Science*, New York, vol. xvii., 1891, pp. 85-90) has occurred, *e.g.* among the Mashpee and Gay Head Indians of Massachusetts, the remnants of the Pequots in Connecticut, the Shinnecocks, &c., of Long Island, also the Montauks; the Pamunkeys, Mattaponies and some other small Virginian and Carolinian tribes. In earlier times some admixture of negro blood took place among the Seminoles, although now the remnants of that people still in Florida are much averse to miscegenation. Of the tribes of the Muskogian stock who kept large numbers of negro slaves the Creeks are said to have about one-third of their number of mixed Indian-negro blood. Sporadic intermixture of this sort is reported from the Shawnee, the Minnesota Chippewa, the Canadian Tuscarora, the Caddo, &c., in the case of the last the admixture may be considerable. It is also thought probable that many of the negroes of the whole lower Atlantic coast and Gulf region may have strains of Indian blood. The mythology and folk-lore of the negroes of this region may have borrowed not a little from the Indian, for as Mooney notes (*19th Rep. Bur. Amer. Ethnol.*, 1900, pp. 232-234), "in all the southern colonies Indian slaves were bought and sold and kept in servitude and worked in the fields side by side with negroes up to the time of the Revolution." When Dr John R. Swanton visited the Haida recently the richest man among the Skidegate tribe was a negro. Some of the Plains tribes and some Indians of the far west, however, have taken a dislike to the negro. The leader in the "Boston Massacre" of March 5, 1770, was Crispus Attucks, of Framingham, Mass., the son of a negro father and a Natick Indian mother. The physical anthropology of the white-Indian half-blood has been studied by Dr Franz Boas (*Pop. Sci. Monthly*, New York, 1894).

Culture, arts, industries, &c.

The culture, arts and industries of the American aborigines exhibit marked correspondence to and dependence upon environment, varying with the natural conditions of land and water, wealth or poverty of the soil, abundance or scarcity of plant and animal life subsidiary to human existence, &c. Professor O. T. Mason (*Handb. of Amer. Inds. N. of Mexico*, 1907, pt. i. pp. 427-430; also *Rep. Smiths. Inst.*, 1895, and *Pop. Sci. Monthly*, 1902) recognizes north of Mexico twelve "ethnic environments," in each of which there is "an *ensemble* of qualities that impressed themselves on their inhabitants and differentiated them."

These twelve "ethnic environments" are:—

(1) *Arctic* (*Eskimo*); (2) *Yukon-Mackenzie* (practically *Athabaskan*); (3) *Great Lakes and St Lawrence* (*Algonkian-Iroquoian*); (4) *Atlantic Slope* (*Algonkian, Iroquoian, Siouan*, &c.); (5) *Gulf Coast*, embracing region from Georgia to Texas (*Muskogian* and a number of smaller stocks); (6) *Mississippi Valley* (largely *Algonkian* and "*mound-builders*"); (7) *Plains*, including the country from the neighbourhood of the Rio Grande to beyond the Saskatchewan on the north, and from the Rocky Mountains to the fertile lands west of the Mississippi (*Algonkian, Siouan, Shoshonian, Kiowan, Caddoan*); (8) *North Pacific Coast*, from Mount St Elias to the mouth of the Columbia river (*Koluschan, Haidan, Tsimshian, Wakashan, Salishan*); (9) *Columbia-Fraser region* (*Salishan, Sahaptian, Chinookan*, &c.); (10) *Interior Basin* between Rocky Mountains and Sierras (*Shoshonian*); (11) *California-Oregon* ("the Caucasus of North America," occupied by more than twenty-five linguistic stocks); (12) *Pueblos region*, basin of Rio Grande, Pecos, San Juan and Colorado (*Pueblos-Keresan, Tanoan, Zuñian*, &c.; on the outskirts predatory *Shoshonian, Athabaskan* tribes; to the south-west, *Yuman*, &c.).

In the Arctic environment the Eskimo have conquered a severe and thankless climate by the invention and perfection of the snow-house, the dog-sled, the oil-lamp (creating and sustaining social life and making extensive migrations possible), the harpoon and the *kayak* or skin-boat (the acme of adaptation of individual skill to environmental demands). In the region of the Mackenzie especially the older and simpler culture of the Athabaskan stock has been much influenced by the European "civilization" of the Hudson's Bay Company, &c., and elsewhere also by contact with Indian tribes of other stocks, for the Athabaskans everywhere have shown themselves very receptive and ready to adopt foreign elements of culture. The culture-type of the North Pacific coast, besides being unique in some respects, stands in certain relations to the culture of the Palaeo-Asiatic tribes of north-eastern Asia who belong properly with the American race. The culture of the Great Plains, which has been studied by Drs Wissler (*Congr. intern. d. Amér.*, Quebec, 1906, vol. ii. pp. 39-52) and Kroeber (*ibid.* pp. 53-63), is marked by the presence of a decided uniformity in spite of the existence within this area of several physical types and a number of distinct linguistic stocks. Here the *tipi* and the camp-circle figure largely in material culture; innumerable ceremonies and religious practices (*e.g.* the "sun-dance") occur and many societies and ceremonial organizations exist. The buffalo and later the horse have profoundly influenced the culture of this area, in which Athabaskan (Sarcee), Kitunahan, Algonkian, Siouan, Shoshonian, Kiowan tribes have shared. In some respects the Plains culture is quite recent and the result of "giving and taking" among the various peoples concerned. Some of them merely abandoned an earlier more sedentary life to hunt the buffalo on the great prairies.

The culture of the Mississippi valley region (including the Ohio, &c.) is noteworthy in pre-Columbian and immediately post-Columbian times for the development of "mound-building," with apparently sedentary life to a large extent. In this Algonkian, Iroquoian and Siouan tribes have participated. In the region of the Great Lakes and on the Atlantic slope occurred the greatest development of the Algonkian and Iroquoian stocks, particularly in social and political activities, expressed both generally, as in the leagues and alliances (especially the famous "Iroquois League"), and individually in the appearance of great men like Hiawatha, Tecumseh, &c. The Gulf region is remarkable for the development in the southern United States of the Muskogian stock (Creek, Choctaw, Chickasaw, &c.), to which belonged the "civilized tribes" now part of the state of Oklahoma. In this area also, toward the west, are to be met religious ideas and institutions (*e.g.* among the Natchez) suggestive of an early participation in or connexion with the beginnings of a culture common to the Pueblos tribes and perhaps also to the ancestors of the civilized peoples of ancient Mexico. In some other respects the culture of this area is noteworthy. In the east also there are evidences of the influence of Arawakan culture from the West Indies. The Pueblos region has been the scene of the development of sedentary "village" life on the largest scale known in North America north of Mexico, and of arts, industries and religious ideas (rain-cult especially) corresponding, as Professor J. W. Fewkes (*Rep. Smiths. Inst.*, 1895, pp. 683-700) has shown, most remarkably to their environment. The arid interior basin is the characteristic area of the great Shoshonian stock, here seen at its lowest level, but advancing with the Piman and other Sonoran and Nahuatlan tribes till in ancient Mexico it attained the civilization of the Aztecs. The California-Oregon area is remarkable for the multiplicity of its linguistic stocks and also for the development of many local culture-types. Within the limits of California alone Dr Kroeber (*Univ. of Calif. Publ. Amer. Arch. and Ethnol.* vol. ii., 1904, pp. 81-103) distinguishes at least four types of native culture.

On account of climatic conditions, in part at least, the development of agriculture in North America has not reached with many Indian tribes a high state of development, although its diffusion is much greater than is generally believed. In the south-eastern part of the United States beans, squashes, pumpkins and some other gourds and melons, potatoes, Indian corn, tobacco, a variety of the sunflower, &c., were cultivated, the growing of beans, squashes and pumpkins extending as far north as Massachusetts and the Iroquois country, in which latter also tobacco was cultivated, as the tribal name ("Tobacco Nation") of the Tionontati indicates. The cultivation of Indian corn extended from Florida to beyond 50° N. and from the Atlantic to far beyond the Mississippi, and, to judge from the varieties found in existence, must have been known to the Indians for a very long period. In the arid region of Arizona and New Mexico a special development of agriculture occurred, made possible by the extensive use of irrigation in pre-Columbian and in more recent times. Here Indian corn, melons, beans, cotton, &c., were cultivated before the arrival of the Spaniards. For religious purposes the Zuñi appear to have selectively produced a great variety of colours in the ears of corn. Where women had much to do with agricultural operations they greatly influenced society and religious and mythological ideas. Hunting and fishing, as might be expected in an extensive and varied environment like the North American continent, exhibit a great range from simple individual hand-capture to combined efforts with traps and nets, such as the communal nets of the Eskimo, the buffalo and deer "drives" of the Plains and other Indians, with which were often associated brush-fences, corrals, "pounds," pitfalls, &c., advantage taken of a natural *cul-de-sac*, &c. A great variety of traps, snares, &c., was used (see Mason in *Amer. Anthrop.*, 1899) and the dog was also of great service with certain tribes, although no special variety of hunting-dogs (except in a few cases) appears to have been developed. The accessory implements for the chase (spear, bow and arrow, harpoon, club, &c.) underwent great variation and specialization. The throwing-stick appears in the north among the Eskimo and in the south-west among the Pueblos. In the Muskogian area the blow-gun is found, and its use extended also to some of the Iroquoian tribes (Cherokee, &c.). In part of this area vegetable poisons were used to capture fish. In the New England region torch-fishing at night was in vogue. With the tribes of the Great Plains in particular the hunt developed into a great social event, and often into a more or less marked ceremonial or religious institution, with its own appropriate preliminary and subsequential rites, songs, formulae, taboos and fetishes, &c., as seen *e.g.* among certain tribes of the Caddoan stock in very interesting fashion.

The art of transportation and navigation among the American aborigines north of Mexico has received special treatment from Mason (*Rep. U.S. Nat. Mus.*, 1894) and Friederici, in his recent monograph *Die Schiffahrt der Indianer* (Stuttgart, 1907). On land some of the Indian tribes made use of the dog-sled and the toboggan in winter, while the dog-*travois* was early met with in the region of the Great Plains. The Eskimo made special use of the dog-sled, but never developed snow-shoes to the same extent as did the Athabaskan and Algonkian tribes; with the last and with the Iroquoian tribes came the perfection of the skin-shoe or moccasin. In the south and south-west appear sandals. In North America the cradle, as pointed out by Professor Mason (*Rep. U.S. Nat. Mus.*, 1894), has undergone great variation in response to environmental suggestion. No wheeled vehicle and no use of an animal other than the dog for means of transportation is known among the aborigines north of Mexico, men, women and children, women especially, having been the chief burden-bearers. Among the types of boats in use are the seal-skin *kayak* and *umiak* (woman's boat) of the Eskimo; the bull-boat or coracle (raw-hide over willow frame) of the Missouri and the buffalo-region; the dug-out of various forms and degrees of ornamentation in divers regions from Florida to the North Pacific coast; bark-canoes (birch, elm, pine, &c.) in the Algonkian, Iroquoian and Athabaskan areas, reaching a high development in the region of the Great Lakes; the peculiar bark-canoe of the Beothuks in the form of two half ellipses; the bark-canoe of the Kootenay (a similar type occurs on the Amur in north-eastern Asia), noteworthy as having both ends pointed under water; the plank-canoes of the Santa Barbara region; the basketry-boats (*coritas*) of the lower Colorado and in south central California; the *balsas* of tule rushes, &c., in use on the lakes and streams of California and Nevada. In various parts of the country log-rafts of a more or less crude sort were in use. No regular sail is reported from North America, although from time to time skins, blankets, &c., were used by several tribes for such purposes.

Since the appearance of Morgan's monograph on the *Houses and House-life of the American Aborigines* (Washington, 1881) our knowledge of the subject has been materially increased by the studies and researches of Boas, Fewkes, Mindeleff, Dorsey, Matthews, Murdoch, Willoughby and others. The dwellings in use among the aborigines north of Mexico varied from the rude brush huts of the primitive Shoshonian tribes, and the still earlier caves, to the communal dwellings of the Iroquois and the Pueblos stocks of New Mexico and Arizona. The principal types are as follows:

Crude brush shelters and huts of the lowest Shoshonian tribes, the Apache (more elaborate), &c.; the *hogan* or earth-lodge of the Navaho, and the earth-lodges of certain Caddoan and Siouan tribes farther north, with similar structures even among the Aleuts of Alaska; the grass-lodge of the Caddoan tribes, still in use among the Wichita; the semi-subterranean earth-covered lodges of parts of California, &c.; the roofed pits of various styles in use in the colder north, &c.; the Eskimo snow-house and wooden *karmak*; the elaborately carved and painted wooden houses of Pacific coast region (Tlingit, Haida, Nootka, &c.), some of which were originally built on platforms and entered by log-ladders; the simple wooden house of northern California; the dome-shaped bark wigwams of the Winnebago and the conical ones of many of the Algonkian tribes; the skin tents or tipis of many of the Plains peoples; the mat tents of the Nez Percé, Kootenay, &c., and the mat houses of the South Atlantic region; the circular wigwam of bark or mats banked up at the base, of the Ohio-Mississippi valley; the palmetto-house of certain Louisiana Indians; the pile-dwellings of the ancient Floridians. Communal houses of divers types were found among the Mohegans, Iroquois, &c., but are especially illustrated by the so-called *pueblos* of the south-western United States, out of which grew probably the elaborate structures of ancient Mexico. Some tribes appear to have had simple and ruder summer dwellings and more elaborate or better constructed winter houses. The Eskimo have sometimes temporary hunting-lodges; the Comanches brush-shelters for summer and lodges of buffalo-skin for winter; with some tribes temporary dwellings were erected for the use of those cultivating the land. Many tribes had their "village-houses" for social purposes, like the *kashim* of the Eskimo. Special tipis or houses for shamans, "medicine-men," &c., were common in many parts of North America. Secret societies had their own lodges and the so-called "men's-house." The houses of the North American Indians are the subject of a monograph by E. Sarfert (*Arch. f. Anthr.*, 1908, pp. 119-215).

The art of fire-making was known to all the aborigines north of Mexico, two methods being widespread, that with flint and pyrites and that by reciprocating motion of wood on wood. For the latter several varieties of apparatus were in use, the simple two-stick apparatus was very common; the Eskimo have a four-part fire-drill and the Iroquois a weighted drill with spindle whorl. The skill displayed in fire-making by some Indians is very great, and the individual parts of the apparatus have in certain regions been highly specialized. The subject of fire-making apparatus and the kindred topic of illumination have been specially treated by Dr Walter Hough (*Rep. U.S. Nat. Mus.*, 1890, pp. 531-587; *Rep. Smiths. Inst.*, 1901–1902). The camp-fire, the torch and the Eskimo lamp represent the employment of fire for artificial light among the aborigines. Fire and smoke were used for signalling by the Plains tribes, &c., and fire-ceremonies form an important part ("new-fire," "fire-dance") of the ritual observances of not a few peoples, especially in the region from Florida to the Rio Grande. In metal-working there is up to the present no convincing evidence of the use of fire (heat only being employed to facilitate the cold-hammering processes by which the metals, copper, silver, gold and iron were manufactured into weapons, implements and ornaments) in metallurgy north of Mexico. The tools used were few and the processes simple, as Cushing (*Amer. Anthrop.*, vol. vii., 1894) has proved by actual experiment. The only metal actually mined in large quantities was copper in the region of Lake Superior, whence came most of that employed in the east and south. In Alaska was a source of copper for the North Pacific coast. No special process of hardening copper other than by hammering was known to the Indians. The gold objects of most interest come from mounds in Florida and a few also from those in the Ohio valley. Galena was used to make simple ceremonial objects by the Indians of the Mississippi valley and the "mound-builders."

The art of sculpture in wood, stone, bone and ivory is best represented by the wooden masks, utensils, house-carvings and totem-poles of the Indians of the North Pacific coast, the stone pipes, ornaments and images of various sorts of the "mound-builders" and other Indians of the Mississippi valley, the carvings of the people of the Floridian pile-dwellings, and the remarkable ivory carvings, sometimes minute, of the Eskimo. Noteworthy also are the slate-sculpture of the Haida, and the work in bone, ivory and deer and mountain goat horn of the British Columbian Indians. The Indians of the region south of the Great Lakes were expert in the manufacture of tobacco-pipes of great variety, among the most interesting being the Catlinite pipes of the Sioux of Minnesota, &c. Soapstone served some of the Eskimo to make lamps and some Indian tribes for other purposes. Pottery appears to have been unknown in certain regions, but flourished remarkably in the Mississippi valley and the Pueblos region of the south-west, where specialization in form and decoration occurred, and ceramic objects of all sorts were manufactured in abundance. The pottery of the Iroquoian and Algonkian tribes of the north-east was, as a rule, rather crude and undeveloped. In many places the relation of ceramic art to basketry is in evidence. Basketry, of which Professor O. T. Mason has recently made a detailed study in his *Aboriginal American Basketry* (Washington and New York, 1902, 1904), and related arts were carried on (especially by women) with great variety of form, decoration, material, &c., over a large portion of the continent. In North America basketry is "*the* primitive art," and here "the Indian women have left the best witness of what they could do in handiwork and expression." The most exquisite and artistic basketry in the world comes from an utterly uncivilized tribe in California. The relation of basketry to symbolism and religion is best observable among the Hopi or Moqui of Arizona. The appreciation of white men for the products of Indian skill and genius in basketry finds full expression in G. W. James's *Indian Basketry* (1900). Weaving is exemplified in the goat's hair blanket of the Chilkat Indians (Koluschan) of Alaska, and similar products; also in the manufactures of buffalo-hair, &c., of the Indians of the Great Plains and Mississippi valley and the textile art of a higher type known to the Pueblos tribes and by some of them taught to the Navaho. Famous are the "Navaho blankets," less so the "Chilkat."

Feather-work and the utilization of bird-skins and feathers for dresses, hats, ornaments, &c., are known from many parts of the continent. In the Arctic regions bird-skins with the feathers on were used to make dresses; the Algonkian tribes of Virginia, &c., had their bird-skin "blankets" and "turkey robes"; the tribes of the North Pacific coast used feathers for decorative purposes of many kinds, as did Indians in other regions also; feather head-dresses and ornaments were much in use among the Plains tribes, &c.; with the Pueblos Indians eagle and turkey feathers were important in ritual and ceremony; some of the tribes of the south-east made fans of turkey feathers. Beads made from various sorts of shell, rolled copper ("mound-builders," &c.), seeds, ivory (Eskimo) and the teeth of various animals are pre-Columbian, like the turquoise-beads of the Pueblos, and they were put to a great variety of uses. Wampum was manufactured by many Algonkian and Iroquoian tribes, who also later produced fine specimens of work with the glass beads introduced by the whites. These glass beads made their way over most of the continent, soon driving out in many sections the older art in shell, &c. European-made wampum-beads affected native art in the 17th century. In the regions where the porcupine abounded its quills were used for purposes of ornamentation on articles of dress, objects of bark, &c., some of the Algonkian and Iroquoian tribes producing beautiful work of this sort.

Besides face and body painting, employed for various purposes and widespread over the continent, particularly in ceremonial observances, during war-time, in courting, mourning, &c., painting found expression among the North American aborigines most fully in the products of the wood art of the Indians of the North Pacific coast (masks, utensils, houses, totem-poles, furniture, &c.), in the more or less ceremonial and symbolic paintings on skins, tipi-covers and the like of some of the Plains tribes (*e.g.* Kiowa, Sioux) and in ceramic art, notably in the remarkable polychrome pottery of the Pueblos tribes. Among several Pueblos tribes of Arizona and New Mexico (also the Navaho and Apache and of a ruder sort among some of the Plains tribes, *e.g.* Cheyenne, Arapaho, Blackfeet) "dry-painting," most highly developed in the sacred ceremonies of the Navaho, is practised and is evidently of great antiquity. The pictures of deities, natural phenomena, animals and plants are made of powdered sandstone of various colours, &c.

Pictography among the aborigines north of Mexico varied from the rude petroglyphs of some of the Shoshonian tribes to the incised work on ivory, &c., of the Eskimo and the paintings on buffalo and other animal skins by some of the Plains tribes, the work of the Pueblos Indians, &c., the nearest approach to hieroglyphics in North America outside of Mexico. Some Indian tribes (*e.g.* the Kootenay) seem not at all given to pictography, while many others have practised it to an almost limitless extent. The pictography and picture-writing of the North American Indians have been the subject of two detailed monographs by Mallery (*4th Ann. Rep. Bur. Ethnol.*, 1882–1883, pp. 3-256; *10th Rep.*, 1888–1889, pp. 1–1290), and the graphic art of the Eskimo has received special treatment by Hoffman (*Rep. U.S. Nat. Mus.*, 1895). Some have argued that this ivory pictography of the Eskimo is of recent origin and due practically to the introduction of iron by the whites, but Boas thinks such a theory refuted by the resemblance of the Eskimo graphic art in question to the birch-bark art of the neighbouring Indian tribes. No real "hieroglyphs," much less any system of writing of an alphabetic nature, have been discovered north of Mexico; the alleged specimens of such, turning up from time to time, are frauds of one sort or another.

The music and song of the American Indians north of Mexico have been studied since the time of Baker (*Über die Musik der Nordamerikanischen Wilden*, Leipzig, 1882) by Boas, Fillmore, Curtis, Fletcher, Stumpf, Cringan (*Ann. Arch. Rep. Ont.*, 1902, 1905), &c. According to Miss Fletcher (*Indian Story and Song*, 1900; also *Publ. Peab. Mus.*, 1893), "among the Indians music envelops like an atmosphere every religious tribal and social ceremony, as well as every personal experience," and "there is not a phase of life that does not find expression in song"; music, too, is "the medium through which man holds communion with his soul and with the unseen powers which control his destiny." Music, in fact, "is coextensive with tribal life," and "every public ceremony as well as each important act in the career of an individual has its accompaniment of song." Moreover, "The music of each ceremony has its peculiar rhythm, so also have the classes of songs which pertain to individual acts: fasting and prayer, setting of traps, hunting, courtship, playing of games, facing and defying death." In structure the Indian song "follows the outline of the form which obtains in our own music," and "the compass of songs varies from 1 to 3 octaves." Among some of the tribes with highly developed ceremonial observances "men and women, having clear resonant voices and good musical intonation, compose the choirs which lead the singing in ceremonies and are paid for the services." A peculiar development of music among the Eskimo is seen in the "nith-songs," by which controversies are settled, the parties to the dispute "singing at" each other till the public laughter, &c., proclaim one the victor. Among the American Indians songs belonging to individuals, societies, clans, &c., are met with, which have to be purchased by others from the owners, and even slight mistakes in the rendition of singing, dancing, &c., are heavily penalized. Musical contests were also known (*e.g.* among the Indians of the Pacific coast). The development of the "tribal song" among the Iroquoian peoples is seen in Hale's *Iroquois Book of Rites* (1881). Songs having no words, but merely changeless vocables, are common. As Dr Boas has pointed out, the genius of the American Indian has been devoted more to the production of songs than to the invention of musical instruments. The musical instruments known to the aborigines north of Mexico, before contact with the whites, according to Miss Fletcher (*Handb. of Amer. Inds.*, 1907, pt. i. p. 960), were drums of great variety in size and form, from the plank or box of some of the tribes of the North Pacific coast to the shaman's drums of the Algonkian and Iroquoian peoples; whistles of bone, wood, pottery, &c. (often employed in ceremonies to imitate the voices of birds, animals and spirits); flageolet or flute (widely distributed and used by young men in courtship among the Siouan tribes); the musical bow (found among the Maidu of California and important in religion and sorcery). Rattles of gourd, skin, shell, wood, &c., are universal, and among some of the tribes of the south-west "notched sticks are rasped together or on gourds, bones or baskets to accentuate rhythm." From the rattle in the Pueblos region developed a sort of ball of clay or metal.

Culture of Indians essentially indigenous.

So far as is known, the primitive culture of the aborigines of North America is fundamentally indigenous, being the reactions of the Indian to his environment, added to whatever rude equipment of body and of mind was possessed by the human beings who at some remote epoch reached the new world from the old, if, indeed, America was not, as Ameghino, on the basis of the discoveries of fossil anthropoids and fossil man in southern South America, maintains, the scene of origin of man himself.

Professor A.H. Keane (*Internat. Monthly*, vol. v., 1902, pp. 338-357), Stewart Culin (*Proc. Amer. Assoc. Adv. Sci.* vol. lii., 1903, pp. 495-500) and Dr Richard Andree (*Stzgsb. d. anthrop. Ges. in Wien*, 1906, pp. 87-98) all agree as to the general autochthony of aboriginal American culture. The day of the argument for borrowing on the ground of mere resemblances in beliefs, institutions, implements, inventions, &c., is past. An admirable instance of the results of exact scientific research in this respect is to be found in Dr Franz Boas's discussion (*Proc. U.S. Nat. Mus.*, 1908, pp. 321-344) of the needle-cases of the Alaskan Eskimo, which were at first supposed to be of foreign (Polynesian) origin. Other examples occur in Mr Culin's study of American Indian games, where, for the first time, the relation of certain of them in their origin and development, and sometimes also in their degeneration and decay, is made clear. The independent origin in America of many things which other races have again and again invented and re-invented in other parts of the world must now be conceded.

The extreme north-western region of North America has recently been shown to be of great importance to the ethnologists. The investigations in this part of America and among the more or less primitive peoples of north-eastern Asia, carried on by the Jesup North Pacific expedition in 1897–1902, have resulted in showing that within what may be called the "Bering Sea culture-area" transmissions of culture have taken place from north-eastern Siberia to north-western America and vice versa. The only known example, however, of the migration of any people one way or the other is the case of the Asiatic Eskimo, who are undoubtedly of American origin, and it seems probable, in the language of Dr Boas, the organizer of the Jesup expedition and the editor of its publications, that "the Chukchee, Koryak, Kamchadal and Yukaghir must be classed with the American race rather than with the Asiatic race," and possibly also some of the other isolated Siberian tribes; also that, "in a broad classification of languages, the languages of north-eastern Siberia should be classed with the languages of America" (*Proc. Intern. Congr. Amer.*, New York, 1902, pp. 91-102). It appears, further, that the arrival of the Eskimo on the Pacific coast (this, although not recent, is comparatively late) from their home in the interior, near or east of the Mackenzie, "interrupted at an early period the communication between the Siberian and Indian tribes, which left its trace in many cultural traits common to the peoples on both sides of the Bering Sea."

This establishment of the essential unity of the culture-type (language, mythology, certain arts, customs, beliefs, &c.) of the "Palaeo-Asiatic" peoples of north-eastern Siberia and that of the American Indians of the North Pacific coast, as demonstrated especially by the investigations of Jochelson, Bogoras, &c., is one of the most notable results of recent organized ethnological research. No such clear proof has been afforded of the theory of Polynesian influence farther south on the Pacific coast of America, believed in, more or less, by certain ethnologists (Ratzel, Mason, &c.). This theory rests largely upon resemblances in arts (clubs, masks and the like in particular), tattooing, mythic *motifs*, &c. But several things here involved, if not really American in origin, are so recent that they may perhaps be accounted for by such Hawaiian and other Polynesian contact as resulted from the establishment of the whale and seal-fisheries in the 18th century.

Between the Indians of North America and those of South America few instances of contact and intercommunication, or even of transference of material products and ideas, have been substantiated. It is by way of the Antilles and the Bahamas that such contact as actually occurred took place. In 1894 (*Amer. Anthrop.* vol. vii. p. 71-79) Professor W. H. Holmes pointed out traces of Caribbean influences in the ceramic art of the Florida-Georgia region belonging to the period just before the Columbian discovery.

The decorative designs in question, paddle-stamp patterns, &c., akin to the motives on the wooden and stone stools from the Caribbean areas in the West Indies, have been found as far north as 36° in North Carolina and as far west as 84° in Tennessee and 89° in south-eastern Alabama. But the evidence does not prove the existence of Carib colonies at any time in any part of this region, but simply the migration from the West Indies to the North American coast of certain art features adopted by the Indians of the Timuquan and Muskogian Indians and (later) in part by the Cherokee. More recently (1907) Dr F. G. Speck, in a discussion of the aboriginal culture of the south-eastern states (*Amer. Anthrop.* vol. ix., n.s., pp. 287-295), cites as proof of Antillean or Caribbean influence in addition to that indicated by Holmes, the following: employment of the blow-gun in hunting, use of hammock as baby-cradle, peculiar storage-scaffold in one corner of house, plastering houses with clay, poisoning fish with vegetable juices. It is possible also that the North American coast may have been visited from time to time by small bodies of natives from the West Indies in search of the mythic fountain of youth (*Bimini*), the position of which had shifted from the Bahamas to Florida in its movement westward. Indeed, just about the time of the advent of the Europeans in this part of the world a number of Indians from Cuba, on such a quest, landed on the south-western shore of Florida, where they were captured by the Calusas, among whom they seem to have maintained a separate existence down to 1570 or later. This Arawakan colony, indicated on the map of linguistic stocks of American Indians north of Mexico, published by the Bureau of American Ethnology in 1907, is the only one demonstrated to have existed, but there may have been others of a more temporary character. In the languages of this region there are to be detected perhaps a few loan-words from Arawakan or Cariban dialects. The exaggerated ideas entertained by some authorities concerning the "mound-builders" of the valley of the Ohio and Mississippi and their alleged "civilization" have led them to assume, without adequate proof, long-continued relations of the tribes inhabiting this part of the country in the past with the ancient peoples of Yucatan and Mexico, or even an origin of their culture from beyond the Gulf. But since these mounds were in all probability wholly the work of the modern Indians of this area or their immediate ancestors, and the greater part, if not all, of the art and industry represented therein lies easily within the capacity of the aborigines of North America, the "Mexican" theory in this form appears unnecessary to explain the facts. In its support stress has been laid upon the nature of some of the copper implements and ornaments, particularly the types of elaborate repoussé work from Etowah, Georgia, &c. That the repoussé work was not beyond the skill of the Indian was shown by Cushing in his study of "Primitive Copper Working" (*Amer. Anthrop.* vol. vii. pp. 93-117), who did not consider the resemblance of these mound-specimens to the art of Mexico proof of extra-North American origin. Holmes (*Handb. of Inds. N. of Mex.*, 1907, pt. i. p. 343) points out that the great mass of the copper of mounds came from the region of Lake Superior, and that had extensive intercourse between Mexico or Central America and the mound-country existed, or colonies from those southern parts been present in the area in question, artifacts of undoubtedly Mexican origin would have been found in the mounds in considerable abundance, and methods of manipulation peculiar to the south would have been much in evidence. The facts indicate at most some exotic influence from Mexico, &c., but nothing far-reaching in its effects.

In the lower Mississippi valley the culture of certain peoples has been thought to contain elements (*e.g.* the temples and other religious institutions of the Natchez) suggestive of Mexican or Central American origin, either by inheritance from a common ancient source or by later borrowings. When one reaches the Pueblos region, with its present and its extinct "village culture," there is considerable evidence of contact and inter-influence, if not perhaps of common origin, of culture-factors. Dr J. Walter Fewkes, a chief authority on the ethnic history of Arizona, New Mexico and the outlying areas of "Pueblos culture," especially in its ceremonial aspects, has expressed the opinion (*Amer. Anthrop.* vol. vii. p. 51) that "it is not improbable that both Mexican and Pueblos cultures originated in a region in northern Mexico, developing as environment permitted in its northern and southern homes." Unfavourable milieu in the north prevented the culture of the Pueblos Indians and the Cliff-dwellers, their ancestors, reaching the height attained in Mexico and Central America, represented by temple-architecture, ornamentation of buildings, hieroglyphs, &c. Strong evidence of Pueblos-Mexican relationship Dr Fewkes sees (*Proc. Wash. Acad. Sci.*, 1900) in the great serpent cult of Tusayan, the "New Fire" and other Pueblos ceremonials of importance; also in the mosaic objects (gorgets, ear-pendants, breast-ornaments, &c.) from Pueblos ruins in Arizona, some of the workmanship of which equals that of similar character in old Mexico. The arid region of the south-western United States and part of northern Mexico may well have been a centre for the dispersion of such primitive institutions and ideas as reached their acme in the country of the Aztecs. But of the Pueblos languages, the Moqui or Hopi of north-eastern Arizona is the only one showing undoubted, though not intimate, relationship with the Nahuatl of ancient Mexico. The Shoshonian family, represented in the United States by the Shoshonees, Utes, Comanches and other tribes, besides the Moqui, includes also the numerous Sonoran tribes of north-western Mexico, as well as the Nahuatl-speaking peoples farther south, some of the outliers having wandered even to Costa Rica (and perhaps to Panama). This linguistic unity of the civilized Aztecs with the rude Utes and Shoshones of the north is one of the most interesting ethnological facts in primitive America. Change of environment may have had much to do with this higher development in the south. Besides the Shoshonian, the Coahuiltecan and the Athabaskan are or have been represented in northern Mexico, the last by the Apaches and Tobosos. From the period of the Spanish colonization of New Mexico down to about the last quarter of the 19th century (and sporadically later, *e.g.* the attack in 1900 on the Mormon settlement in Chihuahua), these Indians have hovered around the Mexican border, &c., their predatory expeditions extending at one time as far south as Jalisco. In the far west the Yuman family of languages belongs on both sides of the border.

Religion, Mythology, &c.

In the popular mind the religion of the North American Indian consists practically of belief in the "Great Spirit" and the "Happy Hunting Grounds." But while some tribes, *e.g.* of the Iroquoian and Caddoan stocks appear to have come reasonably near a pantheistic conception tending toward monism and monotheism, not a little of present Indian beliefs as to the "Great Spirit," "God" and "Devil," "Good Spirit" and "Evil Spirit," &c., as well as concerning moral distinctions in the hereafter, can reasonably be considered the result of missionary and other influences coming directly or indirectly from the whites. The central idea in the religion and mythology of the aborigines north of Mexico is what Hewitt (*Amer. Anthrop.*, 1902) has proposed to term *orenda*, from "the Iroquois name of the fictive force, principle or magic power which was assumed by the inchoate reasoning of primitive man to be inherent in every body and being of nature and in every personified attribute, property or activity belonging to each of these and conceived to be the active cause or force or dynamic energy involved in every operation or phenomenon of nature, in any manner affecting or controlling the welfare of man." The *orendas* of the innumerable beings and objects, real and imagined, in the universe differed immensely in action, function, power, &c., and in like manner varied were the efforts of man by prayers, offerings and sacrifices, ceremonies and rites of a propitiatory or sympathetic nature to influence for his own welfare the possessor of this or that *orenda*, from the "high gods" to the least of all beings. Corresponding to the Iroquoian *orenda* is the *wakanda* of the Siouan tribes, some aspects of which have been admirably treated by Miss Fletcher in her "Notes on Certain Beliefs concerning Will Power among the Siouan Tribes" (*Science*, vol. v., n.s., 1897). Other parallels of *orenda* are Algonkian *manito*, Shoshonian *pokunt*, Athabaskan *cœn*. As Hewitt points out, these Indian terms are not to be simply translated into English by such expressions as "mystery," "magic," "immortal," "sorcery," "wonderful," &c. Man, indeed, "may sometimes possess weapons whose *orenda* is superior to that possessed by some of the primal beings of his cosmology."

The main topics of the mythology of the American Indians north of Mexico have been treated by Powell in his "Sketch of the Mythology of the North American Indians" (*First Ann. Rep. Bur. Ethnol.*, 1879–1880), and Brinton in his *American Hero Myths* (1876), *Myths of the New World* (1896) and *Religions of Primitive Peoples* (1900). Widespread is the idea of a culture-hero or demi-god (sometimes one of twins or even quadruplets) who is born of a human virgin, often by divine secret fecundation, and, growing up, frees the earth from monsters and evil beings, or re-fashions it in various ways, improves the breed and perfects the institutions of mankind, then retires to watch over the world from some remote resting-place, or, angered at the wickedness of men and women, leaves them, promising to return at some future time. He often figures in the great deluge legend as the friend, helper and regenerator of the human race. A typical example of these culture-heroes is the Algonkian character who appears as Nanabozho among the Ojibwa, Wisaketchak among the Cree, Napiw among the Blackfeet, Wisaka among the Sacs and Foxes, Glooscap (Kuloskap) among the Micmac,

&c. (see *Journ. Amer. Folk-Lore*, 1891, and *Handbook of Amer. Inds.*, 1907), whose brother is sometimes represented as being after death the ruler of the spirit world. The Iroquoian correspondent of Nanabozho is Tehoronhiawakhon; the Siouan, in many respects, Ictinike. Among many tribes of the North Pacific coast region the culture-hero appears as the "transformer," demi-god, human or animal in form (coyote, blue-jay, raven, &c.), the last often being tricksters and dupers of mankind and the rest of creation as well. This trickster and buffoon (also liar) element appears also in the Iroquoian and Algonkian culture-heroes and has received special treatment by Brinton (*Essays of an Americanist*, 1890). On the whole, the Algonkian and Iroquoian culture-hero is mainly actuated by altruistic motives, while the "transformer" of the Indians of the North Pacific coast region is often credited with producing or shaping the world, mankind and their activities as they now exist for purely egotistic purposes. Other noteworthy heroes, "reformers," &c., among the North American Indians are the subject of legends, like the Iroquoian "Good Mind and Bad Mind," the Algonkian (Musquaki) "Hot Hand and Cold Hand," the Zuñian "Right Hand and Left Hand"; and numerous others, including such conceptions as the antagonism and opposition of land and water (dry and wet), summer and winter, day and night, food and famine, giants and pigmies, &c. In the matter of the personification of natural phenomena, &c., there is considerable variation, even among tribes of approximately the same state of culture. Thus, *e.g.* as Hewitt notes (*Handbook of Amer. Inds.*, 1907, pt. i. p. 970), while with the Iroquoian and eastern Algonkian tribes "the Thunder people, human in form and mind and usually four in number, are most important and staunch friends of man"; in the region of the Great Lakes and westward "this conception is replaced by that of the Thunder bird."

The Pawnee Indians of the Caddoan stock seem both individually and tribally to possess a deep religious sense expressing itself alike in moods of the person and in ceremonies of a general popular character. This is evident, alike from Miss Fletcher's description (*Amer. Anthrop.*, 1899, pp. 83-85) of a venerable priest of that tribe, Tahiroossawichi, and from her detailed account of "The Hako: A Pawnee Ceremony" (*Twenty-second Ann. Rep. Bur. Ethnol.*, 1900–1901, pp. 5-372). This Hako ceremony, the original stimulus for which was probably desire for offspring, and then to ensure friendship and peace between groups of persons belonging to different clans, gentes or tribes, had no fixed or stated time and "was not connected with planting or harvesting, hunting or war or any tribal festival," although the Indians take up the Hako, with its long series of observances and its hundred songs, "in the spring when the birds are mating, or in the summer when the birds are nesting and caring for their young, or in the fall when the birds are flocking, but not in the winter when all things are asleep; with the Hako we are praying for the gift of life, of strength, of plenty and of peace, so we must pray when life is stirring everywhere,"—these are the words of the Indian hieragogue.

In the arid region of the south-western United States there has grown up, especially among the Moqui, as may be read in the numerous monographs of Dr J. Walter Fewkes (and briefly in the *Report of the Smithsonian Institution for* 1905), a system of religious ceremonials and sympathetic magic, the object of which is to ensure the necessary rainfall and through this the continued life and prosperity of the people. Here everything is conceived as really or symbolically related to sun, water, rain. The Moqui are essentially a religious people, and their mythology, in which the central figures are the "earth mother" and the "sky father," has been described as "a polytheism largely tinged with ancestor-worship and permeated with fetishism." Part of their exceedingly intricate, complex and elaborate ritual is the so-called "snake dance," which has been written of by Bourke (*The Snake Dance of the Moquis*, 1884), Fewkes and others.

In the Gulf region east of the Mississippi, "sun worship," with primitive "temples," appears among some of the tribes with certain curious myths, beliefs, ceremonies, &c. The Natchez, *e.g.* according to Dr Swanton (*Amer. Anthrop.*, 1907), were noteworthy on account of "their highly developed monarchical government and their possession of a national religion centring about a temple, which reminds one in many ways of the temples of Mexico and Central America." They seem to have had "an extreme form of sun-worship and a highly developed ritual." A simpler form of sun-worship is found among the Kootenay of British Columbia (*Rep. Brit. Assoc.*, 1889, 1892). With the Yuchi occur some Algonkian-like myths of the deluge, &c.

The best data as to the religion and mythology of the Iroquoian tribes are to be found in the writings of Hewitt, especially in his monograph on "Iroquoian Cosmology" (*Twenty-first Ann. Rep. Bur. Ethnol.*, 1899–1900, pp. 127-339). In the creation-myths several instances of European influence are pointed out. Mother-earth and her life are the source, by transformation and evolution, of all things. The first beings of Iroquoian mythology (daylight, earthquake, winter, medicine, wind, life, flower, &c.) "were not beasts, but belonged to a rather vague class of which man was the characteristic type,"—later come beast-gods. According to Hewitt the Iroquoian term rendered in English "god" signifies really "disposer, controller," for to these Indians "god" and "controller" are synonymous; and so "the reputed controller of the operations of nature received worship and prayers." Creation-legends in great variety exist among the North American aborigines, from simple *fiat* actions of single characters to complicated transformations accomplished with the aid of other beings. The specific creation legend often follows that of the deluge.

Perhaps the most remarkable of all North American creation stories is that of the Zuñi as recorded by Cushing (*Thirteenth Ann. Rep. Bur. Ethnol.*, 1891–1892) in his "Outlines of Zuñi Creation Myths." Here the principal figure is "Awonawilona, the maker and container of all," and the growth-substance the "fogs of increase," which he evolved by his thinking in the pristine night. The long tale of the origin of the sun, the earth and the sky, and the taking form of "the seed of men and all creatures" in the lowest of the four caves or wombs of the world and their long journey to light and real life on the present earth is a wonderful story of evolution as conceived by the primitive mind, an aboriginal epic, in fact.

In the mythology and religion of the Algonkian tribes (particularly the Chippewa, &c.) is expressed "a firm belief in a cosmic mystery present throughout all nature, called *manitou*." This *manitou* "was identified with both animate and inanimate objects, and the impulse was strong to enter into personal relation with the mystic power; it was easy for an Ojibwa to associate the *manitou* with all forms of transcendent agencies, some of which assumed definite characters and played the rôle of deities" (Jones). There were innumerable *manitous* of high or low degree. The highest development of this conception was in *Kitchi Manitou* (Great Manitou), but whether this personification has not been considerably influenced by teachings of the whites is a question. The chief figure in the mythology of the Chippewa and related tribes is Nanabozho, who "while yet a youth became the creator of the world and everything it contained; the author of all the great institutions in Ojibwa society and the founder of the leading ceremonies" (Jones, *Ann. Arch. Rep. Ontario*, 1905; *Journ. Amer. Folk-Lore*, 1902, &c.). It is to this character that some of the most human of all Indian myths are attached, *e.g.* the Micmac legend of the origin of the crowing of babies and the story of Nanabozho's attempt to stick his toe into his mouth after the manner of a little child. Nanabozho is also the central figure in the typical deluge legend of the Algonkian peoples of the Great Lakes (*Journ. of American Folk-Lore*, 1891), which, in some versions, is the most remarkable myth of its kind north of Mexico.

The best and most authoritative discussion of the religions and mythological ideas of the Eskimo is to be found in the article of Dr Franz Boas on "The Folk-Lore of the Eskimo" (*Journ. Amer. Folk-Lore*, 1904, pp. 1-13). The characteristic feature of Eskimo folk-lore is the hero-tales, treating of visits to fabulous tribes, encounters with monsters, quarrels and "wars," shamanism, witchcraft, &c., and generally of "the events occurring in human society as it exists now," the supernatural playing a more or less important rôle, but the mass of folk-lore being "thoroughly human in character." In Eskimo myths there appears to be "a complete absence of the idea that transformations or creations were made for the benefit of man during a mythological period, and that these events changed the general aspect of the world," quite in contrast with the conceptions of many Indian tribes, particularly in the region of the North Pacific, where the "transformer" (sometimes trickster also), demi-god, human or animal (coyote, raven, blue-jay, &c.), plays so important a part, as may be seen from the legends recorded in Dr Boas's *Indianische Sagen der nord-pacifischen Küste Amerikas* (Berlin, 1895) and other more recent monographs. In Eskimo folk-lore the field of animal tales is quite limited, and Dr Boas is of opinion that the genuine animal myth "was originally foreign to Eskimo folk-lore," and has been borrowed from the Indians. Perhaps the most prominent character in Eskimo mythology is Sedna, the old woman, who is mistress of the lower world beneath the ocean (*Amer. Anthrop.*, 1900). The highest being conceived of by the Athabaskans of Canada was, according to Morice (*Ann. Arch. Rep. Ontario*, 1905, p. 204), "a real entity, which they feared rather than loved or worshipped." The way of communicating with the unseen was through "personal totems," revealed usually in dreams. The Hupa, an Athabaskan people of California, are reported by Goddard as possessing a deep religious sense. But the most remarkable mythology of any Athabaskan tribe is that of the Navaho, which has been studied in detail under some of its chief aspects by Dr Washington Matthews in his valuable monographs, *Navaho Legends* (1897) and *The Night Chant* (1902). According to Dr Matthews, the Navaho "are a highly religious people having many well-defined divinities (nature gods, animal gods and local gods), a vast mythic and legendary lore and thousands of significant formulated songs and prayers, which must be learned and repeated in the most exact manner; they have also hundreds of musical compositions; the so-called dances are ceremonies which last for nine nights and parts of ten days, and the medicine-men spend many years of study in learning to conduct a single one properly." The most prominent and revered of the deities of the Navaho is *Estsanatlehi*, the "woman who rejuvenates herself," of whom it is believed that she grows old, and then, at will, becomes young again.

The numerous Indian tribes subjected to the environment of the Great Plains have developed in great detail some special religious observances, ceremonial institutions, secret societies, ritual observances, &c. The mental life of these Indians was profoundly influenced by the buffalo and later not a little by the horse. Various aspects of Plains culture have recently been discussed by Goddard, Kroeber, Wissler, Dorsey, Fletcher, Boas, &c., from whose investigations it would appear that much intertribal borrowing has taken place. Among some of the Algonkian (Arapaho, Blackfeet, Cheyenne, &c.), Siouan (Ponka, *e.g.*) Caddoan, Shoshonian, Kiowan and perhaps Kitunahan stocks the "sun-dance" in some form or other prevailed at one time or another. According to Wissler (*Amer. Anthrop.*, 1908, p. 205), this ceremony, as now practised by many tribes, "is the result of a gradual accumulation both of ceremonies and ideas,"—the torture feature, *e.g.*, "seems to have been a separate institution among the Missouri river tribes, later incorporated in their sun-dance and eventually passed on to other tribes." Some other complicated ceremonials have apparently grown up in like manner. As ceremonies that are quite modern, having been introduced during the historical period, Dr Wissler instances "the Ghost dance, Omaha dance, Woman's dance,Tea dance and Mescal eating," of which all, except the Ghost dance, "flourish in almost all parts of the area under various names, but with the same essential features and songs." Other interesting ceremonies of varying degrees of importance and extent of distribution are those of "the medicine-pipe, buffalo-medicine, sweat-lodge, puberty-rites, medicine-tipis, war-charms, &c." Interesting also are the "medicine bundles," or "arks" as they were once mistakenly called.

The "Ghost dance," the ceremonial religious dance of most notoriety to-day, "originated among the Paviotso (its prophet was a young Paiute medicine man, Wovoka or 'Jack Wilson') in Nevada about 1888, and spread rapidly among other tribes until it numbered among its adherents nearly all the Indians of the interior basin, from Missouri river to or beyond the Rockies" (Mooney). Wovoka's doctrine was that a new dispensation was at hand, and that "the Indians would be restored to their inheritance and united with their departed friends, and they must prepare for the event by practising the songs and dance ceremonies which the prophet gave them." East of the Rocky Mountains this dance soon came to be known as the "Ghost dance" and a common feature was hypnotic trances. The Sioux outbreak of 1890–1891 was in part due to the excitement of the "Ghost dance." According to Mooney, "in the Crow dance of the Cheyenne and Arapaho, a later development from the Ghost dance proper, the drum is used, and many of the ordinary tribal dances have incorporated Ghost dance features, including even the hypnotic trances." The doctrine generally "has now faded out and the dance exists only as a social function." A full account of this "dance," its chief propagators, the *modi operandi* of its ceremonies and their transference, and the results of its prevalence among so many Indian tribes, is given in Mooney's detailed monograph on "The Ghost Dance Religion and the Sioux Outbreak of 1890" (*Fourteenth Ann. Rep. Bur. Ethnol.*, 1892–1893).

In reference to "Messiah doctrines" among the aborigines of North America, Mooney calls attention to the fact that "within the United States every great tribal movement (*e.g.* the conspiracy of Pontiac, the combination of Tecumseh, &c.) originated in the teaching of some messianic prophet." In primitive America the dance has figured largely in social, religious and artistic activities of all kinds, and one of its most interesting developments has occurred among the Plains Indians, where "the Mandan and o her Siouan tribes dance in an elaborate ceremony, called the Buffalo dance, to bring game when food is scarce, in accordance with a well-defined ritual" (Hewitt). Among other noteworthy dances of the North American aborigines may be mentioned the calumet dance of several tribes, the scalp dance, the "Green-corn dance" of the Iroquois, the *busk* (or *puskitau*) of the Creeks (in connexion with "new fire" and regeneration of all things), the "fire dance" of the Mississaguas, &c.

The Californian area, remarkable in respect to language and culture in general presents also some curious religious and mythological phenomena. According to Kroeber, "the mythology of the Californians was characterized by unusually well-developed and consistent creation-myths, and by the complete lack not only of migration but of ancestor traditions." The ceremonies of the Californian Indians "were numerous and elaborate as compared with the prevailing simplicity of life, but they lacked almost totally the rigid ritualism and extensive symbolism that pervade the ceremonies of most America." The most authoritative discussions of the religion and mythology of the Californian Indians are those of Dr Dixon and Dr Kroeber, the latter especially in the *University of California Publications in American Archaeology and Ethnology* for 1904–1907.

The shamans, "medicine-men," &c., of the American Indians are of all degrees from the self-constituted *angekok* of the Eskimo to those among tribes of higher culture who are chosen from a special family or after undergoing elaborate preliminaries of selection and initiation. The "medicine-men" of several tribes have been described with considerable detail. This has been done for the "Midēwiwin, or Grand Medicine Society of the Ojibwa" by Hoffman (*Seventh Ann. Rep. Bur. Ethnol.* pp. 143-300); for the "Medicine-men of the Apache" by Bourke (*Ninth Ann. Rep.* pp. 443-603) and for those of the Cherokee by Mooney (*Seventh Ann. Rep.* pp. 301-397), while a number of the chief facts concerning American Indian shamans in general have been gathered in a recent article by Dr R. B. Dixon (*Journ. Amer. Folk-Lore*, 1908, pp. 1-12). In various parts of the continent and among diverse tribes the shaman exercises functions as "healer, sorcerer, seer, priest and educator." These functions among the tribes of lower culture are generally exercised by one and the same individual, but, with rise in civilization, the healer-sorcerer and shaman-sorcerer disappear or wane in power and influence as the true priest develops. The priestly character of the shaman appears among the Plains tribes in connexion with the custody of the "sacred bundles" and the keeping of the ceremonial myths, &c., but is more marked among the Pueblos, Navaho, &c., of the south-west, while "a considerable development of the priestly function may also be seen among the Muskogi, particularly in the case of the Natchez, with their remarkable cult and so-called temple." The reverent character of the best "priests" or shamans among the Pawnee and Omaha has been emphasized by Miss A. C. Fletcher and Francis la Flesche. The class-organization of the shamans reaches its acme in the *midē* societies of the Chippewa and the priest-societies of the Pueblos Indians (Moqui, Zuñi, &c.).

Games.

The games of the American aborigines north of Mexico have been made the subject of a detailed monograph by Culin, "Games of the North American Indians" (*Twenty-fourth Ann. Rep. Bur. Ethnol.*, 1902–1903, pp. 1-846), in which are treated the games of chance, games of dexterity and minor amusements of more than 200 tribes belonging to 34 different linguistic stocks. According to Culin, "games of pure skill and calculation, such as chess, are entirely absent." There are more variations in the materials employed than in the object or methods of play and in general the variations do not follow differences in language. The type known as "dice game" is reported here from among 130 tribes belonging to 30 stocks; the "hand-game" from 81 tribes belonging to 28 stocks. The centre of distribution of North American Indian games, which, with the exception of a few post-Columbian additions, are all autochthonous, Culin finds in the south-west —"there appears to be a progressive change from what appears to be the oldest forms of existing games from a centre in the south-western United States, along lines north, north-east and east." Similar changes radiating southward from the same centre are likewise suggested. He is of opinion that, outside of children's games as such and the kinds of minor amusements common in all civilizations, the games of the North American Indians, as they now exist, "are either instruments of rites or have descended from ceremonial observances of a religious character," and that "while their common and secular object appears to be purely a manifestation of the desire for amusement or gain, they are performed also as religious ceremonies, as rites pleasing to the gods to secure their favour, or as processes of sympathetic magic, to drive away sickness, avert other evil, or produce rain and the fertilization and reproduction of plants and animals or other beneficial results." He also believes that these games, "in what appears to be their oldest and most primitive manifestations are almost exclusively divinatory." This theory of the origin of games in divination, which receives considerable support from certain facts in primitive America, needs, however, further proof. So, too, with Mr Culin's further conclusion that "behind both ceremonies and games there existed some widespread myth from which both derived their impulse," that myth being the one which discloses the primal gamblers as those curious children, the divine Twins, the miraculous offspring of the sun, who are the principal personages in many Indian mythologies." These eternal contenders "are the original patrons of play, and their games are the games now played by men."

It was formerly thought that "totemism" and real "gentile organization" prevailed over all of North America. But it now appears that in several sections of the country such beliefs and institutions were unknown, and that even within the limits of one and the same stock one tribe did, while another did not, possess them. Matriarchal ideas and the corresponding tribal institutions were also once regarded as the primal social condition of all Indian tribes, having been afterwards in many cases replaced by patriarchal ideas and institutions. Since the appearance of Morgan's famous monograph on *Ancient Society* (New York, 1878) and his *Systems of Consanguinity and Affinity in the Human Family* (Washington, 1871), the labours of American ethnologists have added much to our knowledge of the sociology of the American Indians. Forms of society among these Indians vary from the absolute democracy of the Athabaskan Ten'a of Alaska, among whom, according to Jetté (*Congr. int. d. Amér.*, Quebec, 1886), there exist "no chiefs, guides or masters," and public opinion dominates ("every one commands and all obey, if they see fit"), to the complicated systems of some of the tribes of the North Pacific coast regions, with threefold divisions of chiefs, "nobles," and "common people" (sometimes also, in addition, slaves), secret and "totemic" organizations, religious societies, sexual institutions ("men's houses," &c.), and other like divisions; and beyond this to the development along political and larger social lines of alliances and confederations of tribes (often speaking entirely different languages) which have played an important rôle in the diffusion of primitive culture, such as the Powhatan confederacy of Virginia and the Abnaki confederacy of the North Atlantic region; the confederacy of the Chippewa, Ottawa and Potawatomi of the Great Lakes; the Huron confederacy of Ontario; the Dakota alliance of the north-west; the Blackfoot confederacy of the Canadian north-west; the Caddoan confederacy of the Arkansas region; the Creek confederacy of the South Atlantic country. The acme of federation was reached in the great "League of the Iroquois," whose further development and expansion were prevented by the coming of the Europeans and their conquest of primitive North America. According to Morgan (*League of the Iroquois*, New York, 1851) and Hale (*Iroquois Book of Rites*, 1881), who have written about this remarkable attempt, by federation of all tribes, to put an end to war and usher in the reign of universal peace, its formation under the inspiring genius of Hiawatha took place about 1459. But J. N. B. Hewitt, himself an Iroquois, offers reasons (*Amer. Anthrop.*, 1892) for believing that the correct date of its founding lies between 1559 and 1570.

Social organization, customs, &c.

Tribes like the Kootenay (*Rep. Brit. Assoc.*, 1892) have no totems and secret societies, nor do they seem to have ever possessed them. This may also be said of some of the Salishan tribes, though others of the same stock have complicated systems. The Klamath Indians (Lutuamian stock) "are absolutely ignorant of the gentile or clan system as prevalent among the Haida, Tlingit and Eastern Indians of North America; matriarchate is also unknown among them; every one is free to marry within or without the tribe, and the children inherit from the father" (Gatschet). In all parts of California indeed, according to Kroeber (*Handbook of Amer. Inds.*, 1907, pt. i. p. 191), "both totemism and a true gentile organization were totally lacking." Nor does it appear that either personal or communal totemism is a necessary attribute of clan and gentile organizations where such do exist. The Heiltsuk of British Columbia have animal totems, while the Kwakiutl do not, although both these tribes belong to the same Wakashan stock. Among the Iroquoian tribes, according to Hewitt (*Handbook*, p. 303), the primary unit of social and political organization, termed in Mohawk *ohwachira*, is "the family, comprising all the male and female progeny of a woman and of all her female descendants in the female line and of such other persons as may be adopted into the *ohwachira*." The head of the *ohwachira* is "usually the oldest woman in it," and it "never bears the name of a tutelary or other deity." The clan was composed of one or more of such *ohwachiras*, being "developed apparently through the coalescence of two or more *ohwachiras* having a common abode." From the clan or gens developed the government of the tribe, and out of that the Iroquois confederation.

The power of the chief varied greatly among the North American aborigines, as well as the manner of his selection. Among the Eskimo, chiefs properly understood hardly have existed; nearly everywhere the power of all sorts of chiefs (both war and peace) was limited and modified by the restraints of councils and other advisers. Age, wealth, ability, generosity, the favour of the shaman, &c., were qualifications for the chieftainship in various parts of the continent. Women generally seem to have had little or no direct voice in government, except that they could (even among some of the Athabaskan tribes) sometimes become chiefs, and, among the Iroquois, were represented in councils, had certain powers and prerogatives (including a sort of veto on war), &c. Many tribes had permanent peace-chiefs and temporary war-chiefs. According to Hewitt (*Handb. of Amer. Inds.*, 1907, pt. i. p. 264), "In the Creek confederation and that of the Iroquois, the most complex aboriginal government north of Mexico, there was, in fact, no head chief. The first chief of the Onondaga federal roll acted as the chairman of the federal council, and by virtue of his office he called the federal council together. With this all pre-eminence over the other chiefs ended, for the governing power of the confederation was lodged in the federal council. The federal council was composed of the federal chiefs of the several component tribes; the tribal council consisted of the federal chiefs and sub-chiefs of the tribe." The greatest development of the power of the chief and his tenure of office by heredity seems to have occurred among the Natchez and certain other tribes of the lower Mississippi and Gulf region. Among the Plains tribes, in general, non-inheritance prevailed, and "any ambitious and courageous warrior could apparently, in strict accordance with custom, make himself a chief by the acquisition of suitable property and through his own force of character" (Hewitt).

Among the North American aborigines the position of woman and her privileges and duties varied greatly from the usually narrow limits prescribed by the Athabaskans, according to Morice (*Congr. int. d. Amér.*, Quebec, 1906), to the socially high status reached among some of the Iroquoian tribes in particular. In the North Pacific coast region the possession of slaves is said to have been a cause of a relatively higher position of woman there than obtained among neighbouring tribes. The custom of adoption both of children and captives also resulted advantageously to woman. The rôle and accomplishments of woman in primitive North America are treated with some detail in Mason's *Woman's Share in Primitive Culture* (1894). The form of the family and the nature of marriage varied considerably among the North American aborigines, as also did the ceremonies of courtship and the proceedings in divorce, &c. With some tribes apparently real purchase of brides occurred, but in many cases the seeming purchase turns out to be merely "a ratification of the marriage by means of gifts." Great differences in these matters are found within the limits of one and the same stock (*e.g.* Siouan). Female descent, *e.g.*, prevailed among the Algonkian tribes of the south-east but not among those of the north and west; and the case of the Creeks (Muskogian) shows that female descent is not necessarily the concomitant of a high social status of woman. Among the Zuñi, where the man is adopted as a son by the father of his wife, "she is thus mistress of the situation; the children are hers, and she can order the husband from the house should occasion arise" (Lowie and Farrand). With many tribes, however, the husband could divorce his wife at will, but Farrand and Lowie in their discussion of Indian marriage (*Handb. of Amer. Inds.*, 1907, pt. i. p. 809) report on the other hand the curious fact that among the Wintun of California "men seldom expel their wives, but slink away from home, leaving their families behind." In the case of divorce, the children generally go with the mother. From a survey of the available data Lowie and Farrand conclude that "monogamy is thus found to be the prevalent form of marriage throughout the continent," varied from to polygamy, where wealth and other circumstances dictated it. In California, *e.g.*, polygamy is rare, while with some of the Plains tribes it was quite common. Here again differences of note occurred within the same stock, *e.g.* the Iroquois proper could not have more than one wife, but the Huron Indian could. The family itself varied from the group of parents and children to the larger ones dictated by social regulations among the eastern tribes with clan organizations, and the large "families" found by Swanton (*Amer. Anthrop.*, 1905) among certain tribes of the North Pacific coast, where relations and "poor relations," servants and slaves entered to swell the aggregate. Exogamy was widely prevalent and incest rare. Cousin-marriages were frequently tabooed.

With many of the North American aborigines the giving of the name, its transference from one individual to another, its change by the individual in recognition of great events, achievements, &c., and other aspects of nominology are of significance in connexion with social life and religious ceremonies, rites and superstitions. The high level attained by some tribes in these matters can be seen from Miss Fletcher's description of "A Pawnee Ritual used when changing a Man's Name" (*Amer. Anthrop.*, 1899). Names marked epochs in life and changed with new achievements, and they had often "so personal and sacred a meaning," that they were naturally enough rendered "unfit for the familiar purposes of ordinary address, to a people so reverently inclined as the Indians seem to have been." The period of puberty in boys and girls was often the occasion of elaborate "initiation" ceremonies and rites of various kinds, some of which were of a very trying and even cruel character. Ceremonial or symbolic "killings," "new-births," &c., were also in vogue; likewise ordeals of whipping, isolation and solitary confinement, "medicine"-taking, physical torture, ritual bathings, painting of face or body, scarification and the like. The initiations, ordeals, &c., gone through by the youth as a prelude to manhood and womanhood resembled in many respects those imposed upon individuals aspiring to be chiefs, shamans and "medicine-men." Many facts concerning these rites and ceremonies will be found in G. Stanley Hall's *Adolescence* (1904) and in the articles on "Ordeals" and "Puberty Customs" in the *Handbook of American Indians North of Mexico* (1907–1910). In the method of approach to the supernatural and the superhuman among the North American aborigines there is great diversity, and the powers and capacities of the individual have often received greater recognition than is commonly believed. Thus, as Kroeber (*Amer. Anthrop.*, 1902, p. 285) has pointed out, the Mohave Indians of the Yuman stock have as a distinctive feature of their culture "the high degree to which they have developed their system of dreaming and of individual instead of traditional connexion with the supernatural." For the Omaha of the Siouan stock Miss A. C. Fletcher (*Proc. Amer. Assoc. Adv. Sci.*, 1895, 1896; *Journ. Anthr. Inst.*, 1898) has shown the appreciation of the individual in the lonely "totem" vigil and the acquisition of the personal *genius*.

Contact of races. From the Indians of North America the white man has borrowed not only hosts of geographical names and many common terms of speech, but countless ideas and methods as to food, medicines, clothes and other items in the conduct of life. Even to-day, as G.W. James points out in his interesting little volume, *What the White Race may learn from the Indian* (Chicago, 1908), the end of the instruction of the "lower" race by the "higher" is not yet. The presence of the Indians and the existence of a "frontier" receding ever westward as the tide of immigration increased and the line of settlements advanced, have, as Prof. Turner has shown (*Ann. Rep. Amer. Hist. Assoc.*, 1893), conditioned to a certain extent the development of civilization in North America. Had there been no aborigines here, the white race might have swarmed quickly over the whole continent, and the "typical" American would now be much different from what he is. The fact that the Indians were here in sufficient numbers to resist a too rapid advance on the part of the European settlers made necessary the numerous frontiers (really "successive Americas"), which began with Quebec, Virginia and Massachusetts and ended with California, Oregon, British Columbia, Yukon and Alaska. The Indians again are no exception to the rule that one of the fundamentally important contributions of a primitive people to the culture-factors in the life of the race dispossessing them consists of the trails and camping-places, water-ways and trade-routes which they have known and used from time immemorial. The great importance of these trails and sites of Indian camps and villages for subsequent European development in North America has been emphasized by Prof. F. J. Turner (*Proc. Wisconsin State Histor. Soc.*, 1889 and 1894) and A.B. Hulbert (*Historic Highways of America*, New York, 1902–1905). It was over these old trails and through these water-ways that missionary, soldier, adventurer, trader, trapper, hunter, explorer and settler followed the Indian, with guides or without. The road followed the trail, and the railway the road.

The fur trade and traffic with the Indians in general were not without influence upon the social and political conditions of the European colonies. In the region beyond the Alleghanies the free hunter and the single trapper flourished; in the great north-west the fur companies. In the Mackenzie region and the Yukon country the "free hunter" is still to be met with, and he is, in some cases, practically the only representative of his race with whom some of the Indian tribes come into contact. J. M. Bell (*Journ. Amer. Folk-Lore*, xvi., 1903, 74), from personal observation, notes "the advance of the barbarous border civilization,—the civilization of the whaler on Hudson's Bay, of the free trader on the Athabasca Lake and river, of the ranchers and placer miners on the Peace and other mountain rivers," and observes further (p. 84) that "the influx of fur-traders into the Mackenzie River region, and even to Great Bear Lake within the last two years, since my return, has, I believe, very much altered the character of the Northern Indians." In many parts of North America the free trapper and solitary hunter were often factors in the extermination of the Indian, while the great fur companies were not infrequently powerful agents in preserving him, since their aims of exploiting vast areas in a material way were best aided by alliance or even amalgamation. The early French fur companies, the Hudson's Bay Company, the North-West Company, the American Fur Company, the Missouri Fur Company, the Russian-American Company, the Alaska Commercial Company, &c., long stood with the Indians for the culture of the white man. For two centuries, indeed, the Hudson's Bay Company was ruler of a large portion of what is now the Dominion of Canada, and its trading-posts still dot the Indian country in the far north-west. The mingling of races in the region beyond the Great Lakes is largely due to the fact that the trading and fur companies brought thither employés and dependants, of French, Scottish and English stock, who intermarried more or less readily with the native population, thus producing the mixed-blood element which has played an important rôle in the development of the American north-west. The fur trade was a valuable source of revenue for the early colonists. During the colonial period furs were sometimes even legal tender, like the wampum or shell-money of the eastern Indians, which, according to Mr Weeden (*Econ. Hist. of New England*), the necessities of commerce made the European colonists of the 17th century adopt as a substitute for currency of the Old World sort.

In their contact with the Indians the Europeans of the New World had many lessons in diplomacy and statecraft. Alliances entered upon chiefly for commercial reasons led sometimes to important national events. The adhesion of the Algonkian tribes so largely to the French, and of the Iroquoian peoples as extensively to the English, practically settled which was ultimately to win in the struggle for supremacy in North America. If we believe Lewis H. Morgan, "the Iroquois alliance with the English forms the chief fact in American history down to 1763."

The whites in their turn have influenced greatly the culture, institutions and ideas of the American aborigines. The early influence of the Scandinavians in Greenland has had its importance exaggerated by Dr Tylor (*Journ. Anthrop. Inst.*, 1879). French influence in Canada and Acadia began early and was very marked, affecting the languages (several Algonkian dialects have numerous loan-words, as have the Iroquois tongues still spoken in Quebec) and the customs of the Indians. French authorities, missionaries and traders seemed to get into more sympathetic relations with the Indians, and the intermarriage of the races met with practically no opposition. Hence the French influence upon many tribes can be traced from the Atlantic past the Great Lakes and over the Plains to the Rocky Mountains and even beyond, where the trappers, *voyageurs*, *coureurs des bois* and missionaries of French extraction have made their contribution to the modern tales and legends of the Canadian north-west and British Columbia. In one of the tales of the North Pacific coast appears *Shishê Tlê* (*i.e.* Jesus Christ), and in another from the eastern slope of the Rockies *Mani* (*i.e.* Mary). Another area of French influence occurs in Louisiana, &c. The English, as a rule, paid much less attention than did the French to the languages, manners and customs and institutions of the aborigines and were in general less given to intermarriage with them (the classical example of Rolfe and Pocahontas notwithstanding), and less sympathetically minded towards them, although willing enough, as the numerous early educational foundations indicate, to improve them in both mind and body. The supremacy of the English-speaking people in North America made theirs the controlling influence upon the aborigines in all parts of the country, in the Pacific coast region to-day as formerly in the eastern United States, where house-building, clothing and ornament, furniture, weapons and implements have been modified or replaced. Beside the Atlantic, the Micmac of Nova Scotia now has its English loan-words, while among the Salishan tribes of British Columbia English is "very seriously affecting the purity of the native spech" (Hill-Tout), and even the Athabaskan Nahané āre adding English words to their vocabulary (Morice).

The English influence on tribal government and land-tenure, culminating in the incorporation of so many of the aborigines as citizens of Canada and the United States, began in 1641. The first royal grants both in New England and farther south made no mention of the native population of the country, and the early proprietors and settlers were largely left to their own devices in dealing with them, the policy of extinguishing their titles to land being adopted as needed. Later on, of course, due recognition was had of the fact that certain parts of America were inhabited by "heathen," "savages," &c., and the chiefs of many of the tribes were looked upon as rulers with prerogatives of princes and royal personages (*e.g.* the "Emperor" Powhatan and the "Princess" Pocahontas, "King" Philip, the "Emperor" of the Creeks, &c.). The method of dealing with the Indian "tribes" by the Federal government as autonomous groups through treaties, &c., lasted till 1871, when, by act of Congress, "simple agreements" were favoured in lieu of "solemn treaties."

Meanwhile no consistent purpose was shown in dealing with the Indian problem. At one time the American policy was to concentrate all the Indians on three great reservations, an expansion of the plan adopted early in the 19th century which set aside the former "Indian country" (afterwards restricted to the Indian Territory). The sentiment in regard to great reservations, however, gradually weakened, till in 1878 it was proposed to concentrate the Indians on smaller reservations; but the entire reservation system became increasingly unpopular, and finally in 1887 Congress enacted the Land Severalty Law, paving the way for abolition of the reservation and agency system; at the same time it emphasized the government policy of gradually (the reservation system was a preliminary step in the way of bringing the Indians more under government control) bringing about the cessation of all "tribes" as independent communities and securing their ultimate entrance upon citizenship with the white population. This certainly was far removed from the declaration of the Virginia Assembly in 1702 that "no Indian could hold office, be a capable witness, or hunt over patented land"; and at this time also, "an Indian child was classed as a mulatto, and Indians, like slaves, were liable to be taken on execution for the payment of debt." As Miss Fletcher (*Handb. of Amer. Inds.*, 1907, pt. i. p. 501) notes, the ordinance of Congress passed in 1787 respecting the duty of the United States to the Indian tribes, which was confirmed by the act of 1789, was reaffirmed in the organizing acts of Alabama, Colorado, Dakota, Idaho, Illinois, Iowa, Kansas, Michigan, Minnesota, Mississippi, Montana, Nebraska, Nevada, Oregon, Wisconsin and Wyoming.

The Land Severalty Law of 1887 (amended 1890) provided for the survey of reservations and the allotment to each person of a tract ranging from 40 to 160 acres, the remainder being sold to white settlers. The process of dividing the Indian lands into individual allotments and disposing of the remainder for the benefit of the tribe or the nation has been very successful in many cases. This policy has culminated in a recent decision of the United States Supreme Court, by virtue of which all Indians living upon their own allotments were declared to be citizens, on the same terms and subject to the same laws as the whites.

During the period 1609–1664, from the visit of Hudson to the surrender of New Amsterdam to the English, the Dutch exercised not a little influence upon the aborigines of the present state of New York and some of the regions adjoining. Hudson's harsh treatment of the natives caused the Dutch trouble later on. Through their trading-post of Fort Orange (now Albany) they came into contact with both Iroquoian and Algonkian tribes, carrying on an extensive trade in furs with some of them, including the New England Pequots. They sided with the Iroquois against the northern Algonkian tribes, but also aided the Mohegans against the Mohawks. Farther south they helped the Senecas against the Munsees. Their quarrels with the English involved many of the Indian tribes on one side or the other. They have been generally condemned for their readiness to furnish the Indians with firearms and intoxicating liquors, though some of these actions were doubtless performed by individual traders and settlers only and cannot be charged to a deliberate policy of the government. The modern title of *Kora*, given by the Canadian Iroquois to the governor-general (also to the king of England), is a corruption of *Corlaer*, the name of a Dutch trusted manager of Rensselaercoyck (cf. the Iroquois name for the French governor, *Onontio* = Montmagny).

German influence among the American Indians north of Mexico has made itself felt among the Eskimo (particularly in Labrador), the Delawares and Mohegans, the Iroquois and the Cherokee, where the Moravian missionaries did much good work. They influenced the Indians for peace and good conduct during the great wars. In Labrador the dress, habitations and beliefs of the Eskimo have been considerably modified. It is said by some that Sequoyah, the inventor of the "Cherokee alphabet," had for father a German settler.

The great influence of the Spaniards upon the American Indians has been treated by Blackmar in his *Spanish Institutions in the South-west*, and by Lummis, Bourke, Hodge and other authorities. The results of Spanish contact and control are seen in the loan-words in the various languages of the region, the consequences of the introduction of domestic animals (horse, mule, sheep, goat, fowls), the perfection of the arts involved in the utilization of wool, the planting of wheat, the cultivation of peaches and other exotic fruits. The difference between the Navaho and their close kinsmen the Apache may be largely attributed to changes wrought by the coming of the Spaniards. The "Mission Indians" of California represent another great point of contact. In California thousands and thousands of Indians were converted and brought under the control of the able and devoted missionaries of the Catholic Church, only to become more or less utterly helpless when Spanish domination ceased and the missions fell into decay. Traces of Spanish influence may be found as far north as the Saskatchewan, where personal names implying origin from a Mexican captive occur; and there is not a little Spanish blood in some of the tribes of the Great Plains, who often took with them from their border raids, or acquired from other tribes, many white prisoners from Mexico, &c.

In Alaska the influence of Russian sailors, traders and settlers during the period of occupancy was considerable, as was also that of the priests and missionaries of the Greek Church, but much of what was thus imposed upon the aborigines has now been modified or is being submerged by the more recent influences of the English-speaking settlers, miners, &c., and the efforts of the American government to educate and improve them. The influence of the Russians extended even to California, as the name "Russian River" would indicate, and Friederici (*Schiffahrt der Indianer*, 1907, p. 46) even thinks that to them is due the sporadic occurrence in that region of skin-boats. It was through the Russians that the Alaskan Eskimo received tobacco. Some Russian words have crept into certain of the Indian languages. It has been said that the Russian authorities from time to time transported a few Indians over-sea to Kamchatka, &c.

The general question of the relations of the Europeans in North America with the Indians has been treated by various authors, one of the most recent being Friederici, whose *Indianer und Amerikaner* (Brunswick, 1900) is perhaps a little too prejudiced.

Indian wars.

The contact between the races in North America has had its darker side, seen in the numerous conflicts and "wars" that have marked the conquest of the continent by the whites and the resistance of the weaker people to the inevitable triumph of the stronger. The following sketch of the warlike relations of various Indian stocks with the European colonists and their descendants brings out the principal facts of historic interest.

Eskimoan.—The history of warfare between the European colonists (and their descendants) and the North American aborigines begins with the conflict of Eskimo and Northmen in Greenland, the last phase of which, in the first half of the 15th century, ended in the destruction of the European settlements and the loss of knowledge of the Eskimo to the Old World till they were rediscovered by Frobisher in 1576 and Davis in 1585. Then came a new series of small conflicts in which the whites have been the chief aggressors—whalers, sealers and other adventurers. In the extreme north-west the Aleuts were very harshly treated by the Russians, and one of the most recent deeds of brutality has been the reported extermination, by irresponsible whalers, of the Eskimo of Southampton Island in Hudson's Bay.

Algonkian and Iroquoian.—Southward, along the Atlantic coast, the period of actual settlement by the whites in large numbers was preceded by numerous conflicts with the Algonkian Indians in which all too often the whites (adventurers, fishermen, &c.) were principally at fault, the natives being sometimes carried off as slaves to Spain and elsewhere in Europe. When Champlain, very shortly after the founding of Quebec, decided to help his Algonkian neighbours against their Iroquoian enemies, an alliance was entered upon which had much to do with the final defeat of France in North America. The battle fought and won by Champlain near Ticonderoga in 1609 made the Iroquois the lasting antagonists of the French, and, since the former held a large portion of what is now the state of New York, the latter were effectually prevented from annihilating or destroying the English colonies to the south. The Iroquois alliance with the English in New York was preceded by one with the Dutch. Another result of the feud between the Iroquois and the French was the destruction of the confederacy of the *Hurons*, themselves a people of Iroquoian stock, established in the region between Lakes Ontario, Erie and Huron, over a large portion of what is now the province of Ontario, although the antagonism between Hurons and Iroquois had existed even before the coming of Cartier and the inevitable conflict had already begun. As an outcome of Champlain's visit to the country of the Hurons in 1615 the Jesuit missionaries had established themselves among these Indians and for thirty-five years laboured with a devotion and sacrifice almost unparalleled in the history of the continent. The struggle ended in the campaign of 1648–1649, in which the Iroquois destroyed the Huron settlements and practically exterminated the people, the French priests in many cases having suffered martyrdom in the most cruel fashion at the hands of the savage conquerors. Such of the Hurons as succeeded in escaping took refuge in some of the safer French settlements or found shelter among friendly Indian tribes farther west. Some of these refugees have their descendants among the Hurons of Lorette to-day and among the Wyandots of Oklahoma. The *Tionontati* (Tobacco Nation) Hurons continued the struggle for some time longer, a battle being fought in 1659 on the Ottawa above Montreal, in which the Iroquois were victorious and the Huron chief slain. As late as 1747–1748 some of the Hurons, who had taken refuge in the west, under Orontony, a wily and unscrupulous chief, who was offended at certain actions of the French, entered into a conspiracy with many Algonkian tribes of the region to destroy the French posts at Detroit, &c., which, however, proved unsuccessful, the plot being revealed through the treachery of a Huron woman. A notable event in the French-Iroquois wars was the attack on Montreal in 1689. After the coming of Frontenac as governor of Canada the wars between the French and English involved some of the Indian tribes more and more, on one side or the other, the *Mohawks* especially, who took part against the French, being famous for their raids from the region of Ohio to far into New Brunswick. During the French war and the American War of Independence the Algonkian and Iroquoian Indians serving on both sides were in part or wholly responsible for numerous massacres and other acts of barbarity, though the whites sometimes showed themselves fully the equals of the savages they condemned.

In New England the most notable conflicts were "the *Pequot* war" of 1637–1638 and "King Philip's war" of 1675–1676, the latter resulting in the overthrow of a powerful confederacy, which at one time threatened the very existence of the colony, and the practical extermination of the Indians concerned, after great havoc had been wrought by them in the white settlements. New England also suffered much from Indian "wars" instigated by the French, and at Caughnawaga and other Iroquois settlements in French Canada there is much white blood resulting from the adoption of captives taken away (*e.g.* at Marlboro and Deerfield, Mass., in 1703–1704) in raids on New England villages. Celebrated in the annals of war are the Algonkian chiefs Tecumseh (Shawnee), who aided the British in the war of 1812, and Pontiac (Ottawa), whose remarkable conspiracy of 1763 has been studied by Parkman; of noted Iroquoian chiefs and warriors may be mentioned Joseph Brant, who fought for the British in the War of Independence, and Logan, ill-famed for his barbarities perpetrated against the border settlements on the Ohio, 1775–1780, &c.

In Virginia the future of the English colony was not absolutely assured much before 1620. From the founding of Jamestown in 1607 until about 1616 the colony was in more or less danger of extinction by starvation or destruction at the hands of the Indians. The most famous and romantic of the Indian wars of Virginia was that in which Captain John Smith was concerned in the days of Powhatan and Opechancanough, when his rescue by Pocahontas is said to have taken place. Under Opechancanough massacres of the English settlers took place in 1622 and 1644 in particular, while intermittent hostilities continued between these dates, many hundreds of whites being slain by the Powhatan Indians and their confederates of Algonkian stock. As a result of wars with the English and also with other Indian tribes, many of the Algonkian peoples of Virginia, like some of the Iroquoian peoples farther south, were by the end of the 17th century greatly reduced in numbers. In the Carolinian region the Iroquoian *Cherokee* warred against the English colonists from 1759 until the War of Independence, and continued their struggle then against the Americans until 1794. After their forcible removal west of the Mississippi in 1838–1839 no serious hostilities occurred, with the exception of a conflict between the whites and a portion of the Cherokee, who had earlier moved into eastern Texas while that state was under the Mexican régime. The *Tuscarora* were in frequent conflict with the English, particularly in the "Tuscarora war" of 1713–14.

Of Algonkian tribes farther west the *Cheyenne* began conflicts with the whites about 1840, made their first incursion into Mexico in 1853, and between 1860 and 1878-1879, according to Mooney, "they were prominent in border warfare . . . and have probably lost more in conflict with the whites than any other tribe of the plains in proportion to their number." They participated in the "Sitting Bull war" of 1876.

The *Chippewa* of the north-western United States in the latter half of the 18th century and till the close of the war of 1812 kept up warfare with the border settlements, but have been generally peaceful since 1815, when a treaty was made. The only serious outbreak among the *Cree*, who have been generally friendly to the whites from the period of first contact, occurred during the Riel "rebellion" of 1885, but was soon settled. In the latter part of the 18th century (up to the treaty of Greenville, 1795) the *Delawares* took a prominent part in opposing the advance of the whites. The *Kickapoos* were concerned in the Indian plot to destroy the fort at Detroit in 1712, and a hundred years later they aided the English against the Americans; in 1832 numbers of them helped Black Hawk in his war against the whites. The *Micmac* were long hostile to the English, being prominent as aids to the French in the New England wars, and it was not until about 1779 or long after the French cession that conflicts between these Indians and the whites came to an end. The *Mississaguas* fought with the Iroquois against the French about 1750, having soon become friendly with the English and remaining so. The *Ottawa* were prominent in the wars of the region about Detroit from 1750 till 1815. Pontiac, whose "conspiracy" of 1763 is noted in American history, was an Ottawa chief. The *Penobscot*, as friends of the French, continued their attacks on the English settlements till about 1750. The *Sacs and Foxes* appear early in the 18th century as antagonists of the French (a rare thing among Algonkian peoples) and they were the instigators of the nearly successful attack on Detroit in 1712. In the war of 1812 most of these Indians sided with the British. Black Hawk, the chief figure in the "war" of 1831–1832, was a Sac and Fox chief, who endeavoured to engage all the Indian tribes of the region in a general alliance against the whites. The *Shawnees* were prominent in the border warfare of the Ohio region, and their famous chief Tecumseh fought for the British in the war of 1812.

Athabaskan.—The Athabaskan tribes of the far north, with the exception of occasional disputes with the traders and settlers, have generally been of a peaceful disposition, and "wars" with the whites have not been recorded to any extent. The warlike members of this stock have been the Apache and the Navaho. The *Apache* from the middle of the 16th century have given evidence of their instinct for raids and depredations on the frontiers of civilization. In recent times the most noteworthy outbreaks were those under Cochise, Victorio, Geronimo, Nana, Nakaidoklini, &c., between 1870 and 1886, in which several hundred whites in Mexico and New Mexico were killed and much property destroyed. As late as 1900 some of the hostile Apaches, who had escaped to the mountains, made a raid on the Mormon settlers in Chihuahua, Mexico. The *Navaho*, when New Mexico passed into the possession of the United States in 1849, had long been in the habit of committing depredations upon the white settlements and the Pueblos. These "wars" continued till 1863, when "Kit" Carson completely defeated them and the greater part of the tribe were made prisoners. Since their release in 1867 they have thriven in peace, although occasionally serious trouble has threatened, as, *e.g.*, in November 1905.

Caddoan.—The *Caddo* proper were friendly to the French and helped them against the Spaniards in the wars of the 18th century. After the annexation of Texas the Indians were badly treated and some of them made answer in kind; in 1855 a massacre of the Indians was proposed by the whites. Since their forced march to Oklahoma in 1859 they have been at peace. The *Arikara* had a brief conflict with the United States authorities in 1823, as a result of the killing of some traders. In the wars of the 18th century the *Kichai* adhered to the cause of the French. The *Pawnee* seem never to have warred against the United States, in spite of much provocation at times.

Californian Stocks.—Such "wars" as are recorded, for the most part between the minor Californian stocks and the whites, have been largely directly or indirectly instigated by the latter for various purposes of gain. The Lutuamian stock is remarkable as furnishing both the *Klamath*, who have always kept peace with the whites, and the *Modoc*, who are well known through the "Modoc war" of 1872–73 under the leadership of their chief, Kintpuash or "Captain Jack."

Kiowan.—The Indians of the Kiowan stock joined with the Comanche, Apache, &c., in the border wars in Texas and Mexico, and, according to Mooney, "among all the prairie tribes they were noted as the most predatory and bloodthirsty, and have probably killed more white men in proportion to their numbers than any other." They have been on their present reservation since 1868, and the only outbreak of importance latterly occurred in 1874–75, when they joined with the Comanche, Cheyenne, &c.

Muskogian.—This stock has furnished some of the most warlike Indians of the continent. The *Chickasaw* were friendly to the English, or rather hostile to the French, in the 18th century (war of 1736–40), and their action practically settled the question of the extension of French power in this region. The *Choctaw* aided the French in the wars of the 18th century, and a few Indians of this tribe participated in the "Creek War" of 1813–14. The *Creeks* or *Muskogees* are famous on account of the terrible war of 1813–14 in which they sustained overwhelming defeat. Earlier they were hostile to the Spaniards in Florida, and during the 18th century were generally friendly to the English, particularly in the "Apalachee war" of 1703–08, when they served under Governor Moore of

Carolina. Another Muskogian people, the *Seminole*, are remembered for the long and bloody "Seminole War" in Florida, 1835–45, in which many atrocities were committed.

Sahaptian.—The Indians of this stock have been generally very friendly to the whites, and the only notable "war" occurred in 1877, when the *Nez Percés*, under their famous chief, Joseph, resisted being confined to their reservation in Idaho. Joseph displayed wonderful generalship; he defeated the American troops several times, and finally executed a most remarkable retreat, over 1000 m., in an attempt to reach Canadian territory. This was foiled within a short distance of the boundary, and the entire force surrendered to Colonel Miles on October 5, 1877.

Shoshonian.—North of Mexico this great stock has developed several warlike peoples. Trouble with the *Bannock* occurred in 1877–78, resulting from the encroachment of the whites at the time of the Nez Percés war, the killing of several settlers, scarcity of food, &c. The outbreak was ended by a campaign under General Howard in which many Indians, men, women and children, were killed and some one thousand taken prisoners. The *Comanche*, through a long period of more than 150 years after the Spanish occupation, kept up a continual series of raids and depredations upon the settlements of the whites in Mexico, &c. Their general friendly attitude towards Americans in later years did not extend to the Texans, with whom for more than thirty years they indulged in savage warfare. They often entered into warlike alliance with the Apache, the Kiowa, &c. After the outbreak of 1874–75 they settled down for good. The leader in this "war" was Quana Parker, a half-blood Comanche, who, after the matter was settled, accepted broadly the new order of things and became "the most prominent and influential figure among the three confederated tribes" (Mooney). The *Paiute*, *Shoshonees* (*Snakes*) and *Utes* have figured in several more or less temporary outbreaks since 1865.

Siouan.—This great stock has had its celebrated antagonists of the whites as well as its famous combatants of other Indian tribes. The *Dakota* (or *Sioux*) were unfriendly to the French for aiding their enemies, the Chippewa, and after the fall of French power in America in 1763, they allied themselves with the English and assisted them in the War of Independence and the war of 1812, with few exceptions. After the treaty of peace in 1815 various minor troubles occurred, but in 1862 the Indians in Minnesota rose under Chief Little Crow and committed terrible barbarities against the settlers, some 800 whites being killed before the revolt was put down. The gold-fever of the whites in Dakota, where the Indians had settled down, precipitated a formidable outbreak in 1876 under the leadership of Sitting Bull, Crazy Horse, Spotted Tail and other chiefs. The most notable event of this "war" was the so-called "massacre" (properly cutting-off) of General Custer and his cavalry at the battle of Little Bighorn on June 25, 1876. When the "Ghost Dance" was prevalent among so many Indian tribes of the Plains in 1890–1891 another serious rising of the Sioux took place, which was put down by General Miles. Sitting Bull was killed (December 15, 1890); and resistance to an attempt to disarm a large party of Indians at Wounded Knee Creek, near the Pine Ridge Agency, resulted (December 29) in a deplorable massacre, in which many women and children were killed. The story of these Sioux outbreaks and the guiltiness of the whites with respect to them has been told authoritatively by Mooney (*14th Ann. Rep. Bur. Ethnol.*, 1892–1893). At one time these troubles threatened to involve the Canadian Indians of the region adjacent. The *Catawba* of South Carolina, in the wars of the 18th century, aided the English against the French, the Tuscaroras (war of 1713–14) and the Lake tribes. They sided with the Americans during the War of Independence. The *Osage* were friendly with the French early in the 18th century and fought with them against the Sacs and Foxes at Detroit in 1714.

Pueblos.—After the Spanish conquest of the Pueblos Indians of Arizona and New Mexico the most remarkable effort of the natives to throw off the foreign yoke was in the general revolt of 1680 under the leadership of Popé of San Juan. At that time among the Moqui (Shoshonian) the missionaries were killed, the churches laid in ruins, &c., and similar events occurred elsewhere in the Pueblos region. For this the Spaniards subsequently took ample vengeance. The Pueblos Indians in general have never taken too kindly to the whites; and to-day at the Moqui pueblo of Oraibi there exist a "Hostile" and a "Friendly" faction, the first bitterly opposed to the Caucasian and all his ways, the latter more liberal-minded, but Indian none the less. An open rupture nearly took place in 1906.

In Canada, since the organization of the Dominion in 1867, Indian wars have been unknown, and Indian outbreaks of any sort rare. In 1890 an outbreak of the Kootenays was threatened, but it amounted to nothing—the present writer traversed all parts of the Kootenay country in 1891 in perfect safety. Occasional "risings" have been reported from the Canadian North-West and British Columbia, but have amounted to little or nothing. In the matter of war it should be noted that some Indian stocks have been essentially peaceful, and have resorted to force only when driven beyond endurance or treated with outrageous injustice. Again, within the same stock one tribe has shown itself peaceable, another quite warlike (*e.g.* Klamath and Modoc, both Lutuamian; the Hares and the Apache, both Athabaskan). Probably the amount and extent of wars existing north of Mexico in Pre-Columbian times were not as large as is generally stated. The introduction of fire-arms, European-made weapons, the horse, &c., and the development of ideas of property made possible through these, doubtless stimulated intertribal disputes and increased the actual number of warlike enterprises. Over a large portion of the continent "wars" were nearly always initiated and carried out by a portion only of the tribe, which often had its permanent "peace party."

Missions and Education.

The missionary labours of the various Christian churches among the North American aborigines have been ably summarized by Mooney in the *Handbook of American Indians North of Mexico* (pt. i. 1907, pp. 874-909). Besides the famous *Relation des Jésuites* (ed. Thwaites, 1896–1901) there are now special mission histories for the Baptists, Congregationalists, Episcopalians, Lutherans, Mennonites, Methodists, Moravians, Mormons. Presbyterians, Quakers, Roman Catholics (also the various orders, &c.), who have all paid much attention to Christianizing and civilizing the Indians. To-day "practically every tribe officially recognized within the United States is under the missionary influence of some religious denomination, workers of several denominations frequently labouring in the same tribe." Something of the same sort might be said of the Indians of Canada, whose religion (that of 76,319 out of 110,345 altogether reported, is known) is given as follows in the *Report of the Department of Indian Affairs* for 1907: Roman Catholics 35,682; Anglicans 15,380; Methodists 11,620; Presbyterians 1527; Baptists 1103; Congregationalists 18; and other denominations 597; besides 10,347 pagans. All the Indians of Nova Scotia, New Brunswick, and Prince Edward Island, are Catholics; in Quebec there are but 678 Protestants (mostly Methodist); in Ontario there are 6173 Catholics to 1030 Baptists, 4626 Methodists, 5306 Anglicans, 18 Congregationalists and 34 Presbyterians. The Indians of British Columbia number 11,529 Catholics, 4304 Anglicans, 3277 Methodists and 431 Presbyterians; those of Manitoba, 1780 Catholics, 1685 Methodists, 382 Presbyterians and 3103 Anglicans; those of Saskatchewan and Alberta 4249 Catholics, 1527 Methodists, 719 Presbyterians, 2549 Anglicans. In some of the tribes and settlements both in Canada and in the United States missionary activities, the influence of individual white men, &c., have led to a great diversity of religious faith, sometimes within comparatively limited areas. Thus in the Mistawasis band of Cree, belonging to the Carlton Agency, province of Saskatchewan, numbering but 129, there are 6 Anglicans, 86 Presbyterians and 37 Catholics; in the Oak River band of Sioux in Manitoba there are 60 Anglicans, 1 Presbyterian, 13 Methodists, 4 Catholics and 195 pagans out of a total of 273. Among the "Six Nations" and the larger Indian peoples of Oklahoma all the leading Christian sects, besides the Salvation Army, the Christian Scientists, the Mormons and the "New Thought" movement are represented. There are also the "Navaho New Faith," the "Shaker Church" of Washington, &c. The history of missionary labours in North America among the aborigines contains stories of disappointment and disaster as well as chronicles of success. Some peoples, like the Timuquans, the Apalachee, the Pakawan tribes, &c., have been converted only to disappear altogether; other great attempts at colonization or "reduction," like the missions of Huronia and California, succeeded for the time on a grand scale, but have fallen victims sooner or later to the fortunes of war, the changes of politics, or their own mechanism and its inherent weaknesses and defects. But the thousands of good church-members, including many ministers of the Gospel, in Canada and the United States, coming from scores of different tribes and many distinct stocks, no less than the general good conduct of so many Indian nations, are a remarkable tribute to the work done by Catholic and Protestant missionaries alike all over the broad continent from the Mexican border to the snows of Greenland and the islands of the Arctic. The martyrdom of the Jesuits among the fierce Iroquois, the zeal of Duncan at Metlakahtla, the fate of the Spanish friars in the Pueblos rebellion of 1680 under Popé, the destruction of the Huron missions in 1641–1649 and of those of the Apalachee in 1703, the death of Whitman at the hands of the Cayuse in 1847, are but a few of the notable events of mission history. The following brief accounts of missionary labours among one or two of the chief Indian stocks and in a few of the chief areas of the continent will serve to indicate their general character.

Californian Indians.—Beginning with the foundation by Father Junipero Serra in 1769 of San Diego de Alcalá, and ending with that of San Francisco Solano in 1823, there were established, from beyond San Francisco Bay to the River Colorado, twenty-three missions of the Catholic faith among the Indians of California, whose direct influence lasted until the "secularization" of the missions and the expulsion of the friars by the Mexican government in 1834. In that year the missions counted 30,650 Indians and produced 122,500 bushels of wheat and corn. They possessed also 424,000 cattle, 62,500 horses and mules, 321,900 sheep, goats, hogs, &c. The mission-buildings of brick and stone contained besides religious houses and chapels, school-rooms and workshops for instruction in arts and industries, and were surrounded by orchards, vineyards and farms. Here Indians of diverse linguistic stocks were "reduced" and "civilized," and their labour fully utilized by the mission-fathers. But, in the words of Mooney (*Handb. of Amer. Inds.* pt. i., 1907, p. 895), "Despite regular life, abundance of food and proper clothing according to the season, the Indian withered away under the restrictions of civilization supplemented by epidemic diseases introduced by the military garrisons or the seal-hunters along the coast. The death-rate was so enormous, in spite of apparent material advancement, that it is probable that the former factor alone would have brought about the extinction of the missions within a few generations." Some of the missions had but a few hundred Indians, some, however, as high as three thousand. Kroeber thinks that their influence was "probably greater temporally than spiritually." After the "secularization" of the missions decay soon set in, which the American occupation of California later on did nothing to remedy, and the native population rapidly decreased. When the supervision of the missionaries no longer sustained them the Indians fell to pieces and the practical results of seventy years of labour and devotion were lost. In 1908 there remained of the "Mission Indians" less than 3000 individuals (belonging to the Shoshonian and Yuman stocks), whose condition was none too satisfactory, the only human relics of the huge attempt at the "reduction" of the Indian that was planned and carried out in California.

Iroquoian.—The French missions among the Hurons began in 1615–1616 with Father le Caron of the Recollect order; those of the Jesuits with Father Brebœuf in 1626. These missions flourished, in spite of wars and other adverse circumstances, till the invasion of the Huron country in Ontario by the Iroquois in 1641 and again in 1649 brought about their destruction and the dispersal of the Hurons who were not slain or carried off as prisoners by the victors. Some took refuge among neighbouring friendly tribes; others settled finally at Lorette near Quebec, &c. The Wyandots, now in Oklahoma, are another fragment of the scattered Hurons. The Hurons of Lorette numbered in 1908, 1 Anglican, 6 Presbyterians and 459 Catholics. The Wyandots of Oklahoma are largely Protestants. The mission among the Mohawks of New York was established in 1642 by Father Jogues (afterwards martyred by the Indians), and in 1653 the church at Onondaga was built, while during the next few years missions were organized among the Oneida, Cayuga and Seneca, to cease during the warlike times of 1658–66, after which they were again established among these tribes. The mission of St François Xavier des Pré (La Prairie), out of which came the modern Caughnawaga, was founded in 1669, and here gathered many Christian Iroquois of various tribes—Mohawk especially. About this time the Iroquois settlement on the Bay of Quinté, Ontario, was formed by Christian Mohawks, Cayugas, &c. The Lake of the Two Mountains mission dates from 1720, that of St Regis from 1756. Another mission at Oswegatchie, founded in 1748, was abandoned in 1807. The Episcopal missions among the Iroquois began early in the 18th century, the Mohawks being the first tribe influenced, about 1700. The extension of the work among the other Iroquoian tribes was aided by Sir William Johnson in the last half of the century and by Chief Joseph Brant, especially after the removal of those of the Iroquois who favoured the British to Canada at the close of the War of Independence. In 1776 the Congregationalists established a mission among the New York Oneida, and later continued their labours also among the Oneida of Wisconsin. The Congregational mission among the New York Seneca began in 1831. In 1791–1798, at the request of Chief Cornplanter, the Pennsylvania Quakers established missions among the Oneida, Tuscarora and Seneca. The Moravian missions among the New York Onondaga were established under the Rev. David Zeisberger about 1745. The Methodist missions among the Ontario Iroquois date from 1820. Of the "Six Nations" Indians of the Grand river, Ontario, the Cayuga and Onondaga are still "pagan," the others being Anglican, Methodist and other denominations, including Seventh Day Adventists, Salvation Army, &c. Among the New York Iroquois great variety of religious faith also exists, the Presbyterians (largest), Methodists, Episcopalians and Baptists being all represented. The Iroquois of Caughnawaga and St Regis are mainly Catholic; at Caughnawaga there is, however, a Methodist school.

Muskogian.—Several tribes of this stock came under the influence of the missions established by the Spanish friars along the Atlantic coast after the founding of St Augustine in 1565. The missionaries in this region were chiefly Franciscans, who succeeded the Jesuits. They were very successful among the Apalachee, but these Indians were constantly subject to attack by the Yamasi, Creek, Catawba and other savage peoples, and in 1703–1704 they were destroyed or taken captive, and the missions came to an end. A few of the survivors were gathered later at Pensacola for a time. In the early part of the 18th century French missions were established among the Choctaw, Natchez, &c., and the Jesuits laboured among the Alibamu from 1725 till their expulsion in 1764. From 1735 to 1739 the Moravians (beginning under Spangenberg) had a mission school among the Yamacraw, a Creek tribe near Savannah. In 1831 a Presbyterian mission was established among the Choctaw on the Yalabusha river in northern Mississippi, to which went in 1834 the Rev. Cyrus Byington, the Eliot mission over which he presided there and in the Indian Territory till 1868 being one of great importance. After the removal of the Indians to the Indian Territory more missions were established among the Choctaw, the Creek and the Seminole, &c. The work was much interfered with by the Civil War of 1861–65, but the mission work was afterwards reorganized. The Baptist missions among the Choctaw began in 1832 and among the Creek in 1839. The "Choctaw Academy," a high school, at Great Crossings, Kentucky, chiefly for young men of the Choctaw and Creek nations, was founded in 1819 and continued for twenty-four years. In 1835 a Methodist mission was established among the Creek, but soon abandoned, to be reorganized later on. Among the Indians of Oklahoma, the Catholic and Mormon churches and practically all the Protestant denominations, including the Salvation Army and the Christian Scientists, are now represented by churches, schools, missions, &c. The missionaries among the Muskogian tribes during the last half of the 18th century, as may be seen from Pilling's *Bibliography of the Muskhogean Languages* (1889), furnished many able students of Indian tongues, whose researches have been of great value in philology. This is true likewise of labourers in the mission-field among the Algonkian, Iroquoian, Athabaskan, Siouan and Salishan tribes and among the Eskimo. The celebrated "Eliot Bible," the translation (1663) of the scriptures into the language of the Algonkian Indians of Massachusetts, made by the Rev. John Eliot (*q.v.*), is a monument of missionary endeavour and prescientific study of the aboriginal tongues. In his work Eliot, like many other missionaries, had the assistance of several Indians. The names of such mission-workers as Egede, Kleinschmidt, Fabricius, Erdmann, Kohlmeister, Bruyas, Zeisberger, Dencke, Rasles, Gravier, Mengarini, Giorda, Worcester, Byington, Wright, Riggs, Dorsey, Williamson, Voth, Eells, Pandosy, Veniaminov, Barnum, André, Mathevet, Thavenet, Cuoq, Sagard, O'Meara, Jones, Wilson, Rand, Lacombe, Petitot, Maclean, Hunter, Horden, Kirkby, Watkins, Tims, Evans, Morice, Hall, Harrison, Legoff, Bompas, Peck, &c., are familiar to students of the aboriginal tongues of America.

When in 1900 the withdrawal by the United States of government aid to denominational schools occurred, it compelled some of the weaker churches to give up such work altogether, and interfered much with the activities of some of the stronger ones. According to the statistics given by Mooney (*Handb. of Amer. Inds.*, 1907, pt. i. p. 897) the Catholic Church had in 1904 altogether, under the care of the Jesuits, Franciscans and Benedictines, &c., and the sisters of the orders of St Francis, St Anne, St Benedict, St Joseph, Mercy and Blessed Sacrament, "178 Indian churches and chapels served by 152 priests; 71 boarding and 26 day schools with 109 teaching priests, 384 sisters and 138 other religious or secular teachers and school assistants." The Catholic mission work is helped by "the Preservation Society, the Marquette League and by the liberality of Mother Katharine Drexel, founder of the order of the Blessed Sacrament for negro and Indian mission work." The corresponding statistics for the chief Protestant churches were as follows:—

Denomination.	Missions and Churches.	Missionaries.	Schools.
Baptist	14	15	4
Congregationalist	10	12	5
Episcopalian	14	28	17
Friends	10	15	1
Mennonite	5	6	0
Methodist		40	1
Moravian	3	3	0
Presbyterian	101	69	32
Total	157	188	60

This is exclusive of Alaska, where Greek Orthodox (18 ministers in

1902), Roman Catholics (12 Jesuits and lay brothers and 11 sisters of St Anne in 1903), Moravians (5 mission stations with 13 workers and 21 native assistants among the Eskimo in 1903), Episcopalians (31 workers, white and native, 13 churches, 1 boarding and 7 day schools in 1903), Presbyterians (a dozen stations and several schools), Baptists, Methodists (several stations), Swedish Evangelical (several stations), Friends (several missions), Congregationalists (mission school) and Lutherans (orphanage), all are labouring.

Before the advent of the whites the children of the North American aborigines "had their own systems of education, through which the young were instructed in their coming labours and obligations, embracing not only the whole round of economic pursuits—hunting, fishing, handicraft, agriculture and household work—but speech, fine art, customs, etiquette, social obligations and tribal lore" (Mason). Parents, grandparents, the elders of the tribe, "priests," &c., were teachers, boys coming early under the instruction of their male relatives and girls under that of their female relatives. Among some tribes special "teachers" of some of the arts existed and with certain of the more developed peoples, such as some of the Iroquoian and Siouan tribes, both childhood and the period of puberty received special attention. Playthings, toys and children's games were widespread. Imitation of the arts and industries of their elders began early, and with not a few tribes there were "secret societies," &c., for children and fraternities of various sorts, which they were allowed to join, thus receiving early initiation into social and religious ideas and responsibility in the tribal unit. Corporal punishment was little in vogue, the Iroquois *e.g.* condemning it as bad for the soul as well as the body. Appeals to the feelings of pride, shame, self-esteem, &c., were commonly made. As the treatment of the youth at puberty by the Omaha *e.g.* indicates, there was among some tribes distinct recognition of individuality, and the young Indian acquired his so-called "totem" or "guardian spirit" individually and not tribally. In some tribes, however, the tribal consciousness overpowered altogether children and youth. With the Indian, as with all other young human beings, "unconscious absorption" played its important rôle. Parental affection among some of the peoples north of Mexico reached as high a degree as with the whites, and devices for aiding, improving and amusing infants and children were innumerable. Some of the "beauty makers," however, amounted to rather serious deformations, though often no worse than those due to the corset, the use of uncouth foot-wear, premature factory labour, &c., in civilized countries.

Interesting details of Indian child-life and education are to be found in books like Eastman's *Indian Boyhood* (1902), Jenks' *Childhood of Jishib the Ojibwa* (1900), Spencer's *Education of the Pueblo Child* (1889), La Flesche's *The Middle Five* (1901), Stevenson's *Religious Education of the Zuñi Child* (1887), and in the writings of Miss A. C. Fletcher, J. O. Dorsey, J. Mooney, W. M. Beauchamp, &c, besides the accounts of missionaries and travellers of the better sort.

Outside of missions proper there were many efforts made by the colonists to educate the Indians. It is an interesting fact, emphasized by James in his *English Institutions and the American Indian* (1894), that several institutions still existing, and now of large influence in the educational world of the United States and Canada, had their origin in whole or in part in the desire to Christianize and to educate the aborigines, which object was mentioned in charters (*e.g.* Virginia in 1606 and again in 1621), &c. Sums of money were also left for the purposes of educating Indian children and youth, many of whom were sent over to England for that purpose, by colonists who adopted them (one such was Sampson Occum, minister and author of the hymn, "Awaked by Sinai's Awful Sound"). In 1618 Henrico College in Virginia was founded, where Indian youth were taught religion, "civility" and a trade. It was succeeded by the College of William and Mary (founded in 1691 with the aid of a benefaction of Robert Boyle), where Indian youth were boarded and received their education for many years. The great university of Harvard has long outgrown "the Indian college at Cambridge," whose single graduate Cheeshateaumuck, took his degree in 1665, but died afterwards of consumption. But its original charter provided for all things "that may conduce to the education of the English and Indian youth of this country in knowledge and godliness." Since Cheeshateaumuck's time, doubtless, there have been graduates of Harvard who could boast of Indian blood in their veins (*e.g.* recently William Jones, the ethnologist), but they have been few and far between. Dartmouth College, at Hanover, New Hampshire, founded in 1754, really grew out of Wheelock's Indian school at Lebanon, Connecticut—at this period there were several such schools in New England, &c. In the royal charter, granted to Dartmouth in 1769, is the provision "that there be a College erected in our said Province of New Hampshire, by the name of Dartmouth College, for the education and instruction of Youth of the Indian Tribes in this Land, in reading, writing and all parts of Learning which shall appear necessary and expedient for civilizing and christianizing children of pagans, as well as in all liberal Arts and Sciences, and also of English Youth and any other." The college of New Jersey long served as one of the institutions for the education of Indian youth. A glimpse of Indians at Princeton is given by Collins (*Princeton Univ. Bull.*, 1902) in his account of the attempt to confer an academic education, at the end of the 18th century, upon Thomas Killbuck and his cousin, George-Bright-eyes, son of a Delaware chief, and a descendant of Taimenend, eponym of the political "Tammany." It would seem that at this period the states and Congress were in the habit of granting moneys for the education of individual Indians at various institutions.

At the present time the most noteworthy institutions for the education of the Indian in the United States are the Chilocco Indian Industrial school, under government auspices, in Kay county, Oklahoma, near Arkansas city, Kansas; the Carlisle school (government) at Carlisle, Pa.; and the Hampton Normal and Agricultural Institute (private, but subsidized by the government), at Hampton, Va.

The Chilocco school is, in many respects, a model institution for Indian youth of both sexes, devoted to "agriculture and attendant industries." It was opened in 1884 with 186 pupils, and in 1906 the attendance was 685 out of an enrolment of 700. There are 35 buildings, and the corps of instruction, &c., consists of "a superintendent, 51 principal employés and 20 minor Indian assistants." The Carlisle school, "the first non-reservation school established by the government," whose origin is due to "the efforts of General R. H. Pratt, when a lieutenant in charge of Indian prisoners of war at St Augustine, Florida, from May 11, 1875, to April 14, 1878," was opened in November 1879 with 147 Indians, including 11 Florida prisoners; it had in 1906 an enrolment of over 1000 pupils of both sexes, under both white and Indian teachers, and an average attendance of 981. In 1906 there were in attendance members of 67 tribes, representing at least 22 distinct linguistic stocks. According to J. H. Dortch (*Handb. of Amer. Inds.*, 1907, pt. i. p. 207), "since the foundation of the school nearly every tribe in the United States has had representatives on its rolls." The following statistics, cited by Mr Dortch, indicate both the success of the school in general and of the "outing system" (pupils are allowed to work in temporary homes, but keeping in close touch with the school), which "has come to be a distinctive feature not only of the Carlisle school but of the Indian school service generally":

Admitted during 25 years	5,170
Discharged during 25 years	4,210
On rolls during fiscal year 1904	1,087
Outings, fiscal year 1904 (girls 426, boys 498)	924
Outings during 21 years (girls 3214, boys 5118)	8,332
Students' earnings 1904	$34,970
Students' earnings during 15 years	$352,951

The staff of the school consists of a superintendent, 75 instructors, clerks, &c. It has graduated "a large number of pupils, many of whom are filling responsible positions in the business world, and especially in the Indian service, in which, during the fiscal year 1903, 101 were employed in various capacities from teachers to labourers, drawing a total of $46,300 in salaries." The Carlisle football team competes with the chief white colleges and universities.

The Hampton Institute was established in 1868 by General S. C. Armstrong and trains both Negroes and Indians, having admitted the latter since 1878. It is partly supported by the government of Virginia and by the United States government, the latter paying $167 a year for 120 Indian pupils, boys and girls (in 1906 there were in attendance 112, of whom 57 were girls and 55 boys), belonging to 33 different tribes, representing 13 distinct linguistic stocks. The following extract from the report of the principal for 1905–1906 is of interest: "Fifteen catechists among the Sioux still hold their own. There are two field-matrons and seven camp-school teachers, all coming into close touch with the more ignorant of the people. Four are physicians getting their living from their white patients and doing more or less missionary work among their own people. William Jones has his degrees of A.M. and Ph.D., and is doing valuable ethnological work for the Carnegie Institution, Columbia University and the American Museum of Natural History in New York. James Murie is assisting in similar work for the Field Museum in Chicago. Hampton has but one Indian lawyer. There are about 50 students holding positions pretty steadily in government schools. About 40 boys have employment at government agencies, 20 being employed as clerks and interpreters, either at the agencies or at the schools. Ten boys are working in machine shops at the north and three are in the navy. A fair proportion are working on their farms; some have accumulated quite a little stock, and five are prosperous cattlemen, seven boys have stores of their own and make a good living from them." The Indian Department has now adopted the policy of giving industrial training and household economy the chief place in education, varying the instruction to suit the environment in which the boy or girl is to grow up and live and not mixing the needs of Alaska with those of California, or those of Dakota with those of Florida.

In Canada the most notable institutions for the education of the Indians are the Mohawk Institute at Brantford, Ontario; the Mount Elgin Institute at Muncey, Ontario; the Brandon Industrial school at Brandon, Manitoba; the Qu'Appelle Industrial school at Lebret, Saskatchewan.

The Mohawk Institute is the oldest, having been founded in 1831 by the "New England Company," which began its work among the Canadian Iroquois in 1822. It is undenominational, aided by a government grant, and had in 1907 an average attendance of 106 out of an enrolment of 111 of both sexes. The Mount Elgin Industrial Institute was founded by the Methodist Missionary Society in 1847, and had an attendance for 1907 of 104 of both sexes. The Brandon Industrial school, under Methodist auspices, had in 1907 an attendance of 104 of both sexes. The Qu'Appelle Industrial school, under Roman Catholic auspices, had an average attendance of 210 of both sexes. All these schools receive government aid. As in the United States, Indian teachers and assistants are often employed when fitted for such labours.

The first appropriation by the Congress of the United States for the general education of the Indians was made in 1819, when the sum of $10,000 was assigned for that and closely allied purposes, and by 1825 there were 38 schools among the Indians receiving government aid, but government schools proper date from 1873 (contract schools are four years older), the order of their institution being day schools, reservation boarding schools, then non-reservation boarding schools. In 1900 the contract schools were practically abandoned and the Indian appropriation devoted to government schools altogether. Latterly some departure from this policy has occurred, following a decision of the Supreme Court. In less than a century the expenditure for Indian education increased from an annual outlay of $10,000 to one of about $5,000,000, to which must be added the expenditures from private sources, which are considerable.

Exclusive of Alaska, there were in the United States in 1906, according to the report of the Commissioner of Indian Affairs, 324 Indian schools (government 261, mission 48, contract 15), with an enrolment of 30,929 and an average attendance of 25,492 pupils, costing the government annually $3,115,953. Of the government schools 25 were non-reservation and 90 reservation boarding schools, and 146 day schools; of the mission schools 45 boarding and 3 day; of the contract schools 8 boarding and 6 public. The schools of a denominational character belonged as follows: 29 to the Catholic Church, 5 to the Presbyterian, 4 to the Protestant Episcopal, 2 to the Congregational, 2 to the Lutheran, and 1 each to the Evangelical Lutheran, Reformed Presbyterian, Methodist, Christian Reformed and Baptist. Besides there were in all 446 public schools on or near reservations which Indians could attend.

In Canada, according to the report of the Department of Indian Affairs for 1907, there was a total of 303 Indian schools (day 226, boarding 55, industrial 22), of which 45 were undenominational, 91 Church of England, 106 Roman Catholic, 44 Methodist and 1 Salvation Army. The total enrolment of pupils was 9618, with an average attendance of 6138. In several cases Indians attend white schools, not being counted in these statistics. The total amount appropriated for Indian schools during the year 1906–1907 was $356,277.

Indian talent and capacity.

The intelligence of the American Indians north of Mexico ranges from a minimum with the lowest of the Athabaskan tribes of extreme north-western Canada and the lowest of the Shoshonian tribes of the south-western United States to a maximum with the highest developed members of the Muskogian and Iroquoian stocks (both the Cherokee branch and the Iroquois proper). It must be remembered, however, that the possibilities of improvement by change of environment are very great, as is shown by the fact that the Hupa of California and the Navaho of Arizona and New Mexico (also the cruel and cunning Apaches) belong to the Athabaskan family, while the Shoshonian includes many of the "civilized nations" of ancient Mexico and, in particular, the famous Aztecs. One way of judging of the intellectual character of the various stocks of North American aborigines is from the "great men" they have produced during the historical periods of contact with the whites. Many of these stocks have, of course, not had occasion for the development of great men, their small numbers, their isolation, their lack of historical experience, their long residence in an unfavourable environment, their perpetual and unrestricted democracy, &c., are some of the sufficient explanations for this state of affairs, as they would be in any other part of the world. The Eskimoan, Athabaskan, Koluschan, Wakashan (and other tribes of the North Pacific coast), Salishan and Shoshonian (except in Mexico) stocks, together with the numerous small or unimportant stocks of the Oregon-California and Gulf-Atlantic regions, have not produced any great men, although members of many tribes have been individually of not a little service to the intruding race in pioneer times and since then, or have been highly esteemed by them on account of their abilities or character, &c. Here might be mentioned perhaps Sacajawea (see *Out West*, xxiii. 223), the Indian woman who acted as guide and helper of the Lewis and Clark expedition and saved the journals at the risk of her life (she has now a statue erected to her memory in Seattle); Louise Sighouin, the Sahaptian convert of whom the missionary de Smet thought so much; Catherine Tekatawitha, the "Iroquois saint," &c.

The following list will serve to indicate some of the "great men" of the Indian race north of Mexico and the stocks to which they have belonged; in it are included also some products of the contact of the two cultures:—

1. *Algonkian.*—In politics and in oratory, as well as in combat, this stock has produced notable characters, the conflict with the whites and the Iroquois doubtless serving to stimulate native genius. Among Algonkian notables may be mentioned "King Philip" and Powhatan; Pontiac and Tecumseh; Black Hawk; Sampson Occum; George Copway; Francis Assickinack, &c.

2. *Athabaskan.*—The possibilities of this stock have been recently illustrated by the Apaches, who, on the one hand, have produced Geronimo, the chief who from 1877 to 1886 gave the United States authorities such trouble, and, on the other, Dr Carlos Montezuma, a full-blood Indian, who, after receiving a good education, served the government as physician at several Indian agencies, and in 1908 was practising his profession in Chicago and teaching in the College of Physicians and Surgeons and the Post-Graduate Medical School. From these southern Athabaskans much is to be expected under favouring conditions.

3. *Iroquoian.*—Here, as among the Algonkian tribes, circumstances favoured the development of men of great ability. Of these may be mentioned: Hiawatha, statesman and reformer (fl. *c.* 1450), the chief mover in the formation of the great "League of the Iroquois"; Captain Joseph Brant; "Red Jacket"; Oronhyatekha (d. 1906), the head of the Independent Order of Foresters, an important secret charitable society, a physician, and a man of remarkable power as an organizer.

4. *Sahaptian.*—A remarkable Indian character was Nez Percé Joseph, the leader of his people in the troubles of 1877. In 1905, at the general assembly of the Presbyterian Church, a delegate representing both whites and Indians was Mark Arthur (b. 1873), a full-blood Nez Percé and since 1900 the successful pastor (fully ordained) of the church at Lapwai, Idaho, the oldest Presbyterian church west of the Rocky Mountains.

5. *Siouan.*—The most famous Indian of Siouan stock is "Sitting Bull" (d. 1890), medicine-man and chief. Miss Angel de Cora, a Winnebago, was in 1908 instructor in art at the Carlisle school.

Another, not always just or fair, method of gauging the intelligence of the North American Indians is by their ability to assimilate the culture of the whites and to profit by the contact of the two races. Curiously enough, some of the tribes at one time considered lowest in point of general intellectual equipment have shown not a little of this ability, and there is a marked difference in this respect between tribes belonging to one and the same stock. The Athabaskan stock *e.g.* shows such variations, or rather perhaps this stock in general exhibits a tendency to adopt the culture of other peoples, thus some of the Athabaskan tribes in Alaska have acquired elements of culture from the Eskimo; the Takulli have been influenced by the Tsimshian, and Nahané by the Tlingit, the Chilcotin by the Salish, the Sarcee by the western Algonkian tribes, and in the extreme south the Navaho by the Pueblos Indians. The Salishan stock has largely this same characteristic. Of these two peoples Mr C. Hill-Tout (*The Salish and Dênê*, London, 1907, p. 50) says: "It would be difficult indeed to find two peoples more susceptible to foreign influences, more receptive of new ideas and more ready and willing to adopt and carry them out." In the relations established between them and the whites not enough advantage in the proper way has been taken of this "philoneism," which ought to have been the basis of their acquisition of our culture, or such aspects of it as suited them best. And perhaps there are other stocks of which, if we knew them well, similar things might be said. Of the Indians of the Shoshonian stock the Paiutes of Nevada and Arizona have shown themselves capable of making themselves necessary to the whites (farmers, &c.) of that region, and not falling victims to the "vices of civilization." Although they still retain their primitive *wickiups* (or rush huts), they seem actually to have improved in health, wealth and character from association with the "superior" race, a rare thing in many respects among the lower Indian tribes of North America. This improvement of the Paiutes causes us not to be surprised when we find the more cultured Moquis and the "civilized" Aztecs of ancient Mexico to belong to the same Shoshonian stock. Acculturation by borrowing has played an important rôle in the development of North American Indian ideas and institutions. This is well illustrated by the history of the Plains Indians, with their numerous intertribal societies, their temporary and their permanent alliances, federations, &c. If ways and means for the transfer of elements of culture indicate intelligence, some of these tribes must rank rather high in the scale. The Algonkian, Iroquoian and Muskogian stocks, both in the case of individuals and in the case of whole tribes (or their remnants), have exhibited great ability in the directions indicated. Of the Caddoan stock the Pawnees seem gifted with considerable native ability expressing itself particularly in the matter of religion (the Hupas, of the Athabaskan stock, seem also to have "a religious sense"). Some tribes of the Siouan stock have, both in the case of individuals and as peoples, given evidence of marked intelligence, especially in relation to psychic phenomena and the treatment of adolescent youth. In their culture, their ceremonies and ritual proceedings, as well as in their material arts, the Pueblos Indians of the south-western United States show, in many ways, their mental kinship with the creators and sustainers of the civilization of ancient Mexico and Central America. From the table of Indian tribes it will be seen that aborigines of the most diverse stocks have shown themselves capable of assimilating white culture and of adapting themselves to the new set of circumstances. Progress and improvement are not at all confined to any one stock.

Syllabaries. A very interesting fact in the history of the education of the aborigines north of Mexico is the success of the attempt to enable them to read and write their own language by means of specially prepared syllabaries, "alphabets," &c. The first of these, the still existing "Micmac hieroglyphics," so-called, was the work of Father le Clercq in 1665, improved by Father Kauder in 1866; one of the most recent, the adaptation of the "Cree syllabary" of Evans by Peck to the language of the Eskimo of Cumberland Sound. The basis of many of the existing syllabaries is "the Cree syllabary," or "Evans Syllabary," invented about 1841 by the Rev. James Evans, a Methodist missionary in the Hudson's Bay region from the study of the shorthand systems current at that time. This syllabary and modifications of it are now in use (with much printed literature) for both writing and printing among many tribes of the Algonkian, Athabaskan (modified by Morice for the Carriers, by Kirkby and others for Chipewyan, Slavé, &c.), Eskimo (modified by Peck), Siouan (Cree syllabary used by Canadian Stonies) stocks. Among the Salishan tribes of the Thompson river region, the Shushwap, Okanagan, &c., a stenographic modification (reproduced by mimeograph) by Father le Jeune of the Duployan system of shorthand has been used with great success. But the most remarkable of all these syllabaries is one more of Indian than missionary origin, in its application at least, the well-known "Cherokee alphabet" of Sequoyah, an uneducated Cherokee half-blood, who got part of his idea from an old spelling-book though his characters did not at all correspond to English sounds—at first 82, later 86 syllables were represented. Invented about 1821 the "Cherokee alphabet" was first used for printing in 1827, and has been in constant use since then for correspondence and for various literary purposes. The effect of this invention is thus described by Mooney (*Myths of the Cherokee*, 1902):—

"The invention of the alphabet had an immediate and wonderful effect on Cherokee development. An account of the remarkable adaptation of the syllabary to the language, it was only necessary to learn the characters to be able to read at once. No school-houses were built and no teachers hired, but the whole Nation became an academy for the study of the system, until, in the course of a few months, without school or expense of time or money, the Cherokee were able to read and write in their own language. An active correspondence began to be carried on between the Eastern and Western divisions, and plans were made for a national press, with a national library and museum to be established at the capital, New Echota. The missionaries, who had at first opposed the new alphabet on the ground of its Indian origin, now saw the advisability of using it to further their own work."

In spite of absurdities of form and position in the characters of this syllabary, it serves its purpose so well that, as Pilling informs us (*Amer. Anthrop.*, 1893), "a few hours of instruction are sufficient for a Cherokee to learn to read his own language intelligibly," and in two and a half months the Cherokee child "acquires the art of reading and writing fluently in these rude characters." The success of the "Cree syllabary" was also astonishing, and in 1890, according to Maclean (*Canad. Sav. Folk*, p. 283), "few Cree Indians can be found who are not able to read the literature printed in the syllabic characters." Here again, "an Indian with average intelligence can memorize the whole in a day, and in less than one week read fluently any book written upon this plan," and many Indians learn to read fluently "with no other teachers but the Indians around the camp-fires." Morice reports equal success with his syllabary: "Through it Indians of common intelligence have learnt to read in one week's leisurely study before they had any primer or printed matter of any kind to help them on. We even know of a young man who performed the feat in the space of two evenings." Le Jeune's experience with the Shuswap and Thompson Indians is the same. The creation of a "literary" class among so many Indian tribes within a comparatively brief period is certainly a very interesting result, and one which gives evidence of native intelligence among children and adults alike (*Amer. Journ. Psychol.*, 1905).

For a general list of authorities on the American aborigines, see bibliography under AMERICA, section 3, *Ethnology*. The literature on the subject, already vast, is continually increasing, and it is impossible to enumerate every contribution made by the large number of expert anthropologists working in this field. The chief works of a special nature have already been cited in the text. (A. F. C.)

INDICATOR (from Lat. *indicare*, to point out), that which points out or records. In engineering, the word is specifically given to a mechanical device for registering the pressure of the working fluid in an engine cylinder during a stroke of the piston, the record so provided being termed the "indicator diagram" (see STEAM-ENGINE). In chemistry, the word is generically applied to re-agents or chemicals which detect usually small quantities or traces of other substances; it is, however, more customarily restricted to re-agents which show whether a substance or solution is acid, alkaline or neutral, the character being revealed in a definite colour change.

Here we shall only deal with indicators in this last restricted sense. They were first systematically employed in analytical chemistry by Robert Boyle, who used the aqueous extracts of the coloured principles present in red-cabbage, violets and cornflowers. The indicator most in use to-day is litmus (*q.v.*), whose solution is turned red by an acid, and blue by an alkali. Several synthetic indicators are employed in acidimetry and alkalimetry. The choice is not altogether arbitrary, for experiments have shown that some are more suitable for acidimetry, while others are only applicable in alkalimetry; moreover, the strength of the acids and bases employed may exert a considerable influence on the behaviour of the indicator.

The following are well-known synthetic indicators: haemoid, obtained from resorcin and sodium nitrite, resembles litmus. Phenolphthalein, obtained by condensing phenol with phthalic anhydride, is colourless both in acid and in neutral solution, but intensely red in the presence of alkali; the colour change is very sharp with strong bases, but tardy with weak ones, and consequently its use should be restricted to acidimetry when a strong base can be chosen, or to alkalimetry when a strong base is present. α-Naphtholphthalein has also been used (*Biochem. Zeit.*, 1910, p. 381). Methyl orange, which is the sodium salt of the acid helianthin, obtained by diazotizing sulphanilic acid and coupling with dimethylaniline, is yellow in neutral and alkaline solutions, but red in acid; the change is only sharp with strong acids. Para-nitrophenol, obtained in the direct nitration of phenol, yields a colourless solution in the presence of acids, and an intense yellow with alkalis. Of more recent introduction are: alizarin red, I.W.S. (alizarin monosulphonic acid), claimed by G. E. Knowles (*Abst. J.C.S.*, 1907, ii. 389) to be better than methyl orange in alkalimetry; 3-amino-2-methylquinoline, used by O. Stark (ibid. 1907, i. 974) in ammonia estimations; para-nitrobenzeneazo-α-naphthol, shown by J. T. Hewitt (*Analyst*, 1908, 33, p. 85) to change from purple to yellow when alkalis are titrated with weak acids; para-dimethylaminoazobenzene-ortho-carboxylic acid, proposed by E. Rupp and R. Loose (*Ber.*, 1908, 41, p. 3905) as very serviceable in the estimation of weak bases, such as the alkaloids or centinormal ammonia; the "resorubin" of M. Barberio (*Gazzetta*, 1907, ii. 577), obtained by acting with nitrous acid on resorcin, which forms a violet, blue or yellow coloration according as the solution is neutral, alkaline or acid. Mention may be made of E. Linder's (*J. Soc. Chem. Ind.*, 1908, 27, p. 485) suggestion to employ metanil yellow, obtained by coupling diazotized meta-aminobenzenesulphonic acid with diphenylamine for distinguishing mineral from organic acids, a violet coloration being produced in the presence of the former.

Theory of Indicators.—The ionic theory of solutions permitted the formulation of a logical conception of the action of indicators by W. Ostwald which for many years held its ground practically unchallenged; and even now the arguments originally advanced hold good, except for certain qualifications rendered necessary by more recent research. In the language of the ionic theory, an acid solution is one containing free hydrions, and an alkaline solution is one containing free hydroxidions. A neutral solution contains hydrions and hydroxidions in equal concentration; this is a consequence of the fact that pure water itself undergoes a certain dissociation, and several different methods show that in the purest water obtainable the concentration of the free hydrions and hydroxidions is 10^{-7} at 24°. Moreover, the law of mass-action (see CHEMICAL ACTION) demands that the product of the concentrations of the hydrions and hydroxidions in any solution is constant at a given temperature, and we see from the above values that this constant is 10^{-14}. It follows, therefore, that the acidity or alkalinity of any solution can be expressed both in terms of hydrion or hydroxidion concentration. Many researches have been directed to classify acid and alkaline solutions according to the concentration of the hydrion. Conductivity determinations show that the maximum concentration of hydrion occurs in 5·8 – N nitric acid, where it has a value of about 2–N, and the minimum occurs in 6·7 – N potassium hydroxide, where its value is 5×10^{-15}, that of the hydroxidion being about 2 – N. These figures apply to a temperature of 24°. Bearing in mind the concentration of the ions in a neutral solution, it is seen that a scheme of seven grades of "neutrality," differing by successive powers of ten, may be formulated. The concentration of hydrion and hydroxidion in any solution may be determined by several independent methods, and it is therefore a simple matter to prepare solutions of definite ionic concentrations and to test these with the object of obtaining a list of indicators according to their sensitiveness. It is found that litmus responds to concentrations of $10^{-6}H\cdot$ and $10^{-6}OH'$, a result which shows this dye to be the best indicator of true neutrality. Methyl orange responds to between $10^{-4}H\cdot$ and $10^{-5}H\cdot$; para-nitrophenol to between $10^{-5}H\cdot$ and $10^{-6}H\cdot$; and phenolphthalein to between $10^{-5}OH'$ and $10^{-6}OH'$. Salm (*Zeit. Elektrochem.*, 1904, 10, p. 341) gives a list of twenty-seven indicators classified on this principle. Other papers bearing on this subject are Friedenthal, ibid., p. 113; Salessky, ibid., p. 204; Fels, ibid., p. 208; Scholtz, ibid., p. 549; M. Handa, *Ber.*, 1909, 42, p. 3179.

The actual mechanism by which the indicator changes colour with varying concentrations of hydrion or hydroxidion is now to be considered. Ostwald formulated his ionization theory which assumes the change to be due to the transition of the non-dissociated indicator to the ionized condition, which are necessarily of different colours. On this theory, an indicator must be weakly basic or acid, for if it were a strong acid or base high dissociation would occur when it was in the free state, and there would be no change of colour when the solution was neutralized. Take the case of a weakly acid indicator such as phenolphthalein. The presence of an acid depresses the very slight dissociation of the indicator, and the colour of the solution is that of the non-dissociated molecule. The addition of an alkali, if it be strong, brings about the formation of a salt of phenolphthalein, which is readily ionized, and so reveals the intense red coloration of the anion; a weak base, however, fails to give free ions. An acid indicator of medium strength is methyl orange. When free this substance is ionized and the solution shows an orange colour, due to a mixing of the red of the non-dissociated molecule and the yellow of the ionized molecule. Addition of hydrions lessens the dissociation and the solution assumes the red colour, while a base increases the dissociation and so brings about the yellow colour. If the alkaline solution be titrated with a strong acid, the hydrions present in a very small amount of the acid suffices to reverse the colour; a weak acid, however, must be added in considerable excess of the quantity properly required to neutralize the solution, owing to its weak dissociation. This indicator is therefore only useful when strong acids are being dealt with, while its strongly acid nature renders it serviceable for both strong and weak bases.

It seems, however, that in addition to a change in the ionic condition of an indicator, there are cases where the coloration is associated with tautomeric change. For example, J. T. Hewitt (*Analyst*, 1908, 33, p. 85) regards phenolphthalein and similar indicators as obeying the following equilibrium in solution,

$$O : X_u \cdot H \rightleftarrows X_v \cdot O \cdot H \rightleftarrows X_v \cdot O' + H\cdot,$$

X_u and X_v being isomeric. This indicates the presence of two tautomeric forms, one being of a quinonoid structure, and an ionized molecule. A similar view is advanced by A. Hantzsch and F. Hilscher (*Ber.*, 1908, 41, p. 1187) who find that helianthin is quinonoid when solid, whilst in solution there is an equilibrium between an aminoazo- and sulphonic acid-form; on the other hand, the sodium salt, methyl orange, is a sulphonate under both conditions.

INDICTMENT (from Anglo-Fr. *enditement*, *enditer*, to charge; Lat. *in*, against, *dictare*, declare), in English law, a formal accusation in writing laid before a grand jury and by them presented on oath to a court of competent jurisdiction. The accusation is drawn up in the form of a "bill" of indictment, prepared by the officer of the court or the legal adviser of the prosecution, engrossed on parchment, and sent before the grand jury. The grand jury hear in private the witnesses in support of the accusation (whose names are endorsed on the back of the bill), and, if satisfied that a prima facie case has been made out, find the bill to be a true bill and return it to the court as such. If otherwise, the jury ignore the bill and return to the court that they find "no true bill." Indictments differ from presentments, which are made by the grand jury on their own motion and their own knowledge; and from informations, which are instituted on the suggestion of a public officer without the intervention of a grand jury.

An indictment lies for "all treasons and felonies, for misprision of treasons and felonies and for all misdemeanours of a public nature at common law." And if a statute prohibit a matter of public grievance or command a matter of public convenience all acts or omissions in disobedience to the command or prohibition of the statute are treated as misdemeanours at common law, and unless the statute otherwise provides are punishable on indictment. In other words, the ordinary common law remedy in respect of criminal offences is by indictment of the accused and trial before a petty jury; and except in the case of informations for misdemeanour and summary proceedings by a court of record for "contempt of court" it is the only remedy, except where a statute creates another remedy, *e.g.* by trial before a court of summary jurisdiction.

The form of an indictment is still in the main regulated by the old common law rules of pleading, which as to civil pleadings were often amended during the 19th century, and finally abolished under the Judicature Acts.

An indictment may consist of one or more counts charging different offences. Each count consists of three parts: (1) the commencement, (2) the statement, (3) the conclusion. The formal commencement runs thus: "Surrey to wit." The first count begins "The jurors for our Lord the King (*i.e.* the grand jurors) upon their oath present that, &c."; and the subsequent counts begin, the "jurors aforesaid on their oath aforesaid do further present." The first words, which are placed in the margin of the document, are the "venue," *i.e.* the county or district over which extends the jurisdiction of the court before which the indictment is found. Subject to certain statutory exceptions it is necessary to prove that the acts or omissions alleged to constitute the offence occurred within that area. The conclusion consists of the words following: "against the form of the statute (or statutes) in that case made and provided, and against the peace of our Lord the King, his crown and dignity." Where the offence is statutory the whole phrase is used; where it is at common law only the second part is used. A formal conclusion is not now essential to the validity of the indictment, but from inveterate habit is in continued use. The statement sets forth the circumstances alleged to constitute the offence, *i.e.* the accusation made. There are still in force a number of rules as to the proper elements in the statement; but in substance it is only necessary to set forth the facts alleged against the accused with accuracy and sufficient precision as to the time and place and circumstances of the alleged offence, and to indicate whether felony or misdemeanour are charged, and so to frame the statement as to indicate a definite offence for which a lawful sentence may be imposed.

The following example illustrates the form of the statement:—

"That A. B. on the first day of June in the year of our Lord 1906 one oak tree of the value of five pounds the property of C. D. then growing in a certain park of the said C. D. situate in the parish of E. in the county of F. feloniously did steal take and carry away contrary to the statute, &c."

Only one offence should be stated in one count; and separate and distinct felonies should not be charged in the same indictment. If they are, the court makes the prosecution choose one upon which to proceed. This rule is altered by statute in certain cases: *e.g.* by allowing a limited number of separate thefts, or receivings of stolen property to be included in the same indictment. Misdemeanours and felonies may not be included in the same indictment because of the difference of procedure on the trial; but any number of misdemeanours may be included in different counts of the same indictment, subject to the right of the court to order separate trials or to quash the indictment if it is rendered vexatious by the agglomeration of charges.

There is no general limitation of the time within which indictments may lawfully be preferred; but various limitations have been fixed by statute for certain offences, *e.g.* in the case of certain forms of treason, of riot, of night poaching and of corrupt and illegal practices at elections. In this respect English law differs from European law, in which limitations of time for prosecution are the rule and not the exception.

Until the mitigation of the draconic severity of the English law in the early part of the 19th century, little or no power existed of amending defective statements or indictments, and the courts *in favorem vitae* insisted strictly on accurate pleading and on proof of the offences exactly as charged. Since 1827 numerous enactments have been passed for getting rid of these technicalities, which led to undeserved acquittals, and since 1851 the courts have had power to disregard technical objections to the form of indictment and to amend in matters not essential in case of variance between the indictment and the evidence. These changes apply to ordinary offences; but for the most part do not touch charges of treason, as to which the old law in the main still applies. At the present time the looseness of pleading in criminal cases is carried almost too far; for while there is no danger in such looseness when times are quiet and when law is administered by the judges of the High Court in England, yet when crimes of a certain character are committed in times of great political excitement and the law is administered by an inferior judiciary, there may be some danger of injustice if the strictness of pleading and procedure is too much relaxed. In the Criminal Code drafted by Sir James Fitz James Stephen and revised by a judicial commission (Lord Blackburn and Lords Justices Lush and Barry), it was proposed to substitute for the old form of indictment a statement of the particulars of the offence with a reference to the section of the code defining the offence.

The law of Ireland as to indictments is in substance the same as that of England; but is to a certain extent expressed in different statutes.

In Scotland the terms indictment or criminal letters are used to express the *acte d' accusation*. But except in the case of high treason there is no grand jury, and the indictment is filed like an English criminal information by the lord advocate or one of his deputies: and it is only by order of the court of justiciary that a prosecution can be instituted without the general or particular assent of the lord advocate. By the Criminal Procedure Scotland Act 1887 the form of Scots indictments is much simplified. They are drawn in the second and not in the third person.

In those of the British colonies in which by settlement or statute the English criminal law runs, the form of indictment is substantially the same, and is found by a grand jury as in England. But in certain colonies, *e.g.* the Australian states, an indictment by a public officer without the intervention of a grand jury has been adopted. In India and British Asiatic possessions the procedure is regulated by the Indian Procedure Code or its adaptations. In South Africa indictments are framed under Roman Dutch law as modified by local legislation.

In the United States prosecution or indictment by a grand jury is the rule: the form of indictment is the same, substituting the state or commonwealth of the United States for references to the king, and the conclusions "against the form of the statute" and "against the peace" are still in use. (W. F. C.)

"**INDIES, LAWS OF THE,**" in the colonial history of Spain, a general term designative either (1) of certain codifications of legislation for the colonies listed below, and especially the compilation of 1680; or (2) of the whole body of colonial law, of which those compilations were but a selection, and which was made up of a multitude of royal *cêdulas*, orders, letters, ordinances, provisions, instructions, *autos*, dispatches, pragmatics and laws—all emanating from the crown (or crown and cortes) and all of equal force—that were passed through various departments of government to various officers and branches of the colonial administration, or between the different departments of government in Spain. The transfer of Spanish law to Ultramar began with the first days of the Conquest; and especially the civil law was translated with comparatively slight alteration. Many things, however, peculiar to colonial conditions—the special relations of the crown and the papacy in America, the *repartimientos* and *encomiendas* ("divisions of lands" and "commendations," a system of patronage, or modified slavery) of the Indians, the development of African slavery, questions of natural and international law, the spread of discovery and establishment of new settlements and administrative areas, the sales and grants of public lands, the working of the mines—necessitated the organization of a great mass of special law, made up of a body of general doctrine and a vast quantity of administrative applications, *la matêria de Indias*—to which references are already found in the time of Ferdinand. The general doctrine was applicable everywhere in Ultramar, and the difficult and inconstant communication between the provinces, and other considerations, early counselled some work of codification. The first efforts to this end were begun in Mexico in 1525; a volume was published in 1563, and other inadequate compilations in 1596 and 1628, and finally the great *Recopilación de Leyes de los Reinos de las Indias* of 1680. This code has enjoyed great fame, and in some ways even extravagant praise. The greatest praise that has been given it is that its dominant spirit through and through is not the mercantile aim but the political aim—the principle of civilization; and this praise it deserves. It had various defects, however, of an administrative nature; and as time passed its basic doctrines—especially its minute administrative strangulation of colonial political life, and its monopolistic economic principles—became fatally opposed to conditions and tendencies in the colonies. Two centuries in formation, the code of 1680—continually altered by supplementary interpretation and application—was only one century in effect; for in the seventeen-sixties Charles III. began, in a series of liberal decrees, to break down the monopolistic principles of colonial commerce. This change came too late to save the mainland colonies in America, but its remarkable effects were quickly seen in the aggrandizement of Cuba. It is in the history of this colony (as also in Porto Rico and the Philippines) that one must follow the later history of the Laws of the Indies (see CUBA).

Of the *Recopilación* of 1680, five editions were issued by the government, the last in 1841 (Madrid, 4 vols.); and there are later, private editions approved by the government. See also J. M. Zomora y Coronado, *Biblioteca de legislacion Ultramarina* (Madrid, 1844–1849, 6 vols., with appendices often bound as vol. 7); J. Rodriguez San Pedro, *Legislacion Ultramarina concordada*, covering 1837–1868 (12 vols., Madrid, 1865–1868, vols. 10-12 being a supplement); the *Boletin oficial del Ministerio de Ultramar*, covering 1869–1879; and M. Fernandez Martin, *Compilacion legislativa del gobierno y administracion civil de Ultramar* (Madrid, 1886–1894); the gap of 1879–1886 can be filled for Cuba by the series of *Reales Ordenes... publicadas en la Gaceta de la Habana* (annual, Havana, 1857–1898, covering 1854–1898).

INDIGO (earlier *indico*, from Lat. *indicum*, the Indian substance or dye; the Sans. name was *niti*, from *nila*, dark blue, and this through Arab. *al-nil*, *annil*, gives "aniline") one of the most important and valuable of all dyestuffs. Until comparatively recently it was obtained exclusively from the aqueous extract of certain plants, principally of the genus *Indigofera* which belongs to the natural order Leguminosae. Small quantities are also obtained from *Lonchocarpus eyanescens* (west coast of Africa), *Polygonum tintorium* (China) and the woad plant *Isatis tinctoria*. The latter is of historical interest, since up to the middle of the 17th century it was the only blue dyestuff used by dyers in England and on the adjoining continent; at the present time woad is still cultivated in Europe, but serves merely as a ferment in the setting of the fermentation indigo vat or so-called "woad vat" used in wool dyeing.

The bulk of the natural indigo which is brought into the market comes from India, while smaller quantities are imported from Java, Guatemala and other places. The plant from which indigo is made in Bengal is the *Indigofera sumatrana*, which is reared from seed sown about the end of April or the beginning of March. By the middle of June the plant has attained a height of from 3 to 5 ft., and it is at this period that the first manufacturing begins, a second crop being obtained in August. The indigo is contained in the leaf of the plant in the form of a colourless glucoside, known as indican, $C_{14}H_{17}O_6N{\cdot}3H_2O$. This substance is soluble in water and by the joint action of an enzyme, contained in the leaf, and atmospheric oxygen it yields indigotine, the colouring matter of indigo. It is on these facts that the manufacturing of indigo from the plant is based.

The plant is cut early in the morning and transported to the factory in bullock carts. Here it is steeped in water in steeping vats having a capacity of about 1000 cub. ft. for periods varying, according to circumstances, from nine to fourteen hours, when the liquid—the colour of which varies from a bright orange to an olive green—is run into the beating vats which lie at a lower level. The beating, the object of which is to bring the liquor as freely as possible into contact with the air, was formerly done by striking the surface with bamboo sticks, but is now effected either by means of a paddle wheel or by forcing a current of air from a steam blower or a compressor through the liquid. When the beating is finished, the precipitated indigo is allowed to settle, the supernatant liquid being drawn off and run to waste. The indigo mud thus obtained, which is known as *mal*, is strained, boiled for a short period for the purpose of sterilizing, formed into bars, cut into blocks of about 3 in. cube and dried.[1] The actual amount of colouring matter yielded by the leaf is but small, averaging, according to Ch. Rawson, 0·5%, but the yield from the whole plant is considerably less, since the stalks and twigs contain practically no colour.

Since the introduction on a large scale of synthetic indigo efforts have been made in India and in Java to place the cultivation of the plant and the manufacture of the natural product on a more scientific basis. But although many important improvements have been achieved from the agricultural as well as from the manufacturing point of view, resulting no doubt in the retension of a portion of the industry, the synthetic product has gained the upper hand and is likely to retain it.

Natural indigoes vary considerably in composition, containing in some qualities as much as 90% and in others as little as 20% of colouring matter. The blue colouring matter which indigo contains is known as indigotine, but there are usually also present in small quantities other colouring matters such as indigo red or indirubrine, a yellow colour known as kaempferol, indigo green and indigo brown, as well as indigo gluten and more or less mineral matter.

The bulk of the indigo which now comes into the European market is prepared synthetically from coal tar. The following figures indicate the values of the imports into England of natural and synthetic indigo, and are taken from the official Board of Trade returns:—

	Natural Indigo.	Synthetic Indigo.
1899	£986,090	..
1900	542,089	..
1901	788,820	..
1902	498,043	£143,613
1903	262,775	110,970
1904	316,070	83,397
1905	116,902	121,269
1906	111,455	147,325

During the period 1899–1908, the average price of indigo had declined from a fraction under 3s. to about 2s. 2½d. per lb. At first sight it might appear that the use of indigo in England was rapidly declining, but this does not necessarily follow when it is borne in mind that London was formerly the distributing centre of natural indigo for the continent and America.

Chemistry.—Our knowledge of the chemistry of indigo is largely derived from the classical researches of A. von Baeyer and his collaborators. In 1841 Erdmann and Laurent observed that on oxidation indigo yielded isatin; and in 1848 Fritzsche obtained aniline by distilling the dyestuff with potash. In 1870 A. v. Baeyer and Knop succeeded in preparing indigotine by heating isatin with phosphorus trichloride, acetyl chloride and phosphorus. In the same year, C. Engler and A. Emmerling obtained small quantities of the dyestuff by heating nitroacetophenone with soda-lime and zinc dust, while in 1875 M. v. Nencki prepared it by the oxidation of indol by ozone. Indol had been previously obtained from albuminoids by means of the pancreas ferment. It was not, however, until 1880 that v. Baeyer, who had been at work on the subject since 1865, was able to obtain indigotine from more or less easily accessible coal tar derivatives of known constitution. The most important of these synthetic processes due to the researches of v. Baeyer was the production of the dyestuff from ortho-nitrophenylpropiolic acid (see PROPIOLIC ACID), which yields indigotine on being treated with caustic soda and a reducing agent such as grape sugar or xanthate of soda. Although used in small quantities in calico printing, it never attained any commercial importance as a means of producing indigo, the cost of production being far too high.

Many synthetic processes of preparing indigotine have since been devised, but the one which stands out pre-eminently from a technical point of view and the one which ultimately led to the commercial success of the synthetic product is that of Heumann who showed in 1890 that indigotine can be prepared by melting phenylglycocoll

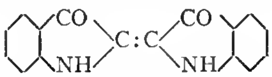
[1] For a full account of the manufacture of indigo in northern Behar see Ch. Rawson, *Journn. Soc. Dyers and Colourists* (July 1899).

(phenylglycine), $C_6H_5{\cdot}NH{\cdot}CH_2{\cdot}COOH$, with caustic alkalis. The yield was at first very unsatisfactory. It was subsequently found, however, that by starting with phenylglycocoll-ortho-carboxylic acid, the yield was sufficiently good to render the process a practical success. The starting-point for the manufacture of synthetic indigo is naphthalene, $C_{10}H_8$, which is oxidized, by heating with concentrated sulphuric acid in the presence of a little mercury, to phthalic anhydride, $C_6H_4(CO)_2O$, which is then converted into ortho-aminobenzoic acid, $C_6H_4(NH_2)(CO_2H)$, by treatment with an alkaline hypochlorite. This acid is then condensed with monochloracetic acid to form phenylglycocoll-ortho-carboxylic acid, $C_6H_4(NH{\cdot}CH_2{\cdot}CO_2H)(CO_2H)$, which on being melted with caustic alkali yields indoxylic acid, $C_6H_4{<}^{C(OH)}_{NH}{>}C{\cdot}CO_2H$, and this readily loses carbon dioxide and passes over into indoxyl, $C_6H_4{<}^{C(OH)}_{NH}{>}CH$. By alkaline oxidation indoxyl is converted into indigotine.

The patent literature of processes for bringing about the conversion of the phenylglycine or its carboxylic acid into indoxylic acid, indoxyl and indigotine is enormous; a circumstance due to the fact that the efficiency of this operation controls the price of the synthetic dyestuff. Caustic soda has been practically given up, being replaced partly or wholly by caustic potash; in addition, alkaline earths, sodamide, nitrides, alkali carbides, &c., have been used. In 1906, Meister, Lucius and Brüning patented the addition of lead and sodium to a mixture of caustic potash and soda; the Basler Chemische Fabrik use a mixture of caustic potash and soda at 210°-260°; Léon Lilienfeld added slaked lime or magnesia to the fused alkali, with a subsequent heating in a current of ammonia at 150°-300°, and in 1908 patented a process wherein the melt is heated under greatly reduced pressure; this gave a yield of 80-90%.

Synthetic indigo comes into the market chiefly in the form of a 20% paste but is also sold in the solid state in the form of a powder.

Indigotine, $C_{16}H_{10}N_2O_2$, is a derivative of indol and its constitution is



It can be prepared in an almost pure state by extracting good qualities of Bengal or Java indigo or synthetic indigo with boiling nitrobenzene, from which it crystallizes on cooling in dark blue crystals having a metallic sheen. When heated in an open vessel it readily volatilizes, yielding a violet vapour which condenses on cooling in the form of crystals. Indigotine is also soluble in boiling aniline oil, quinoline, glacial acetic acid and chloroform, but is insoluble in water, dilute acids and alkalis and ordinary solvents like alcohol, ether, &c. By nitric acid and many other oxidizing agents it is readily converted into isatin, $C_8H_5NO_2$. Heated with concentrated sulphuric acid it yields a disulphonic acid, $C_{16}H_8N_2O_2(SO_3H)_2$, the sodium salt of which finds application as an acid colour in wool dyeing under the name of Indigo carmine.[1] By the action of reducing agents, indigotine is converted into *indigo white*, $C_{16}H_{12}N_2O_2$, which is readily soluble in alkalis or milk of lime with a yellow colour. On exposing the alkaline solution to the air the indigo white is rapidly oxidized back to indigotine, and on these two reactions the application of indigo in dyeing and printing is based. (See DYEING and TEXTILE PRINTING.)

Various halogen (chlorine and bromine) substitutive derivatives of indigotine have been introduced which, while not differing essentially from ordinary indigo in their properties, produce for the most part redder shades in dyeing. They are claimed to be faster and brighter colours. It has been shown by Friedländer (*Ber.*, 1909, 42, p. 765) that the reddish violet colouring matter obtained from the colour-yielding glands of the mollusc *Murex brandaris*, by means of which the famous Tyrian purple of the ancients was dyed, is a dibromindigo, $C_{16}H_8Br_2N_2O_2$. A new departure in the synthetic dyestuffs belonging to the indigo group was inaugurated by the discovery in 1906 by P. Friedländer of thioindigo red, a derivative of thionaphthen, which is formed from phenylthioglycol-ortho-carboxylic acid, $C_6H_4{<}^{CO_2H}_{S\cdot CH_2CO_2H}$. This substance, on boiling with alkali and then with dilute acid yields thioindoxyl, $C_6H_4{<}^{CO}_{S}{>}CH_2$, which is converted by alkaline oxidation into thioindigotin, having the constitution $C_6H_4{<}^{CO}_{S}{>}C{:}C{<}^{CO}_{S}{>}C_6H_4$. The new dye-stuff is therefore analogous to indigotine, from which it differs by having the imino groups replaced by sulphur atoms. Thioindigo red can be readily crystallized from boiling benzene, and forms reddish brown crystals possessing a metallic reflex. Thioindigo scarlet, $C_6H_4{<}^{CO}_{S}{>}C{=}C{<}^{CO}_{C_6H_4}{>}NH$, is also obtained synthetically. Both products come into the market in the form of pastes and are used in dyeing like indigo (see DYEING). (E. K.)

[1] Although bright shades of blue are produced with this derivative, they are not fast.

INDIUM (symbol In, atomic weight 114·8), a metallic chemical element, included in the sub-group of the periodic classification of the elements containing aluminium, gallium and thallium. It was first discovered in 1863 by F. Reich and Th. Richter (*Journ. für prak. Chem.*, 1863, 89, p. 444) by means of its spectrum. It occurs naturally in very small quantities in zinc blende, and is best obtained from metallic zinc (which contains a small quantity of indium) by treating it with such an amount of hydrochloric acid that a little of the zinc remains undissolved; when on standing for some time the indium is precipitated on the undissolved zinc. The crude product is freed from basic zinc salts, dissolved in nitric acid and the nitric acid removed by evaporation with sulphuric acid, after which it is precipitated by addition of ammonia. The precipitated indium hydroxide is converted into a basic sulphite by boiling with excess of sodium bisulphite, and then into the normal sulphite by dissolving in hot sulphurous acid. This salt on strong ignition leaves a residue of the trioxide, which can be converted into the metal by heating in a current of hydrogen, or by fusion with sodium (C. Winkler, *Journ. für prak. Chem.*, 1867, 102, p. 273). Indium is a soft malleable metal, melting at 155° C. Its specific gravity is 7·421 and its specific heat 0·05695 (R. Bunsen).

Indium oxide, In_2O_3, is a yellow powder which is formed on ignition of the hydroxide. It is readily reduced on heating with carbon or hydrogen, and does not pass into an insoluble form when ignited. The *hydroxide*, $In(OH)_3$, is prepared, as a gelatinous precipitate, by adding ammonia to any soluble indium salt. It is readily soluble in caustic potash, but insoluble in ammonia.

Three chlorides of indium are known: the *trichloride*, $InCl_3$, a deliquescent salt, formed by heating a mixture of the oxide and carbon in a current of chlorine; the *dichloride*, $InCl_2$, obtained by heating the metal in hydrochloric acid gas; and the *monochloride*, $InCl$, which is prepared by distilling the vapour of the dichloride over metallic indium. The mono- and dichlorides are decomposed by water with the formation of the trichloride, and separation of metallic indium. *Indium Sulphate*, $In_2(SO_4)_3$, is obtained as a white powder very soluble in water by evaporating the trioxide with sulphuric acid. Concentration of the aqueous solution in a desiccator gives a deposit of crystals of a very deliquescent salt, $H_2In_2(SO_4)_4{\cdot}8H_2O$. An *indium ammonium alum*, $In_2(SO_4)_3{\cdot}(NH_4)_2SO_4{\cdot}24H_2O$ is known.

The atomic weight of indium has been determined by C. Winkler and by R. Bunsen by converting the metal into its oxide. Thiel (*Ber.*, 1904, 37, p. 1135) obtained the values 115·08 and 114·81 from analyses of the chloride and bromide, whilst F. C. Mathers (*Abst. J.C.S.*, 1907, ii. 352) obtained 114·88 and 114·86. Indium salts can be recognized by the dark blue colour they give in the flame of the Bunsen burner; and by the white beads of metal and the yellow incrustation formed when heated on charcoal with sodium carbonate.

INDIVIDUALISM (from Lat. *individualis*, that which is not divided, an individual), in political philosophy, the theory of government according to which the good of the state consists in the well-being and free initiative of the component members. From this standpoint, as contrasted with that of the various forms of socialism (*q.v.*) which subordinate the individual to the community, the community as such is an artificial unity. Individualism is, however, by no means identical with egoism, though egoism is always individualistic. An individualist may also be a conscientious altruist: he is by no means hostile to or aloof from society (any more than the socialist is necessarily hostile to the individual), but he is opposed to state interference with individual freedom wherever, in his opinion, it can be avoided. The practical distinction in modern society is necessarily one of degree, and both "individualism" and "socialism" are very vaguely used, and generally as terms of reproach by opponents. Every practical politician of whatever party must necessarily combine in his programme individualistic and socialist principles. Extreme individualism is pure anarchy: on the other hand Thomas Hobbes, a characteristic individualist, vigorously supported absolute government as necessary to the well-being of individuals. Moreover it is conceivable under given circumstances that an individualist might logically advocate measures (*e.g.* compulsory military service) which conflict with individual freedom. In practice individualism is chiefly concerned to oppose the concentration of commercial and industrial enterprise in the hands of the state and the municipality. The principles on which this opposition is based are mainly two: that popularly elected representatives are not likely to have the qualifications or the sense of responsibility required for dealing with the multitudinous enterprises and the large sums of public money involved, and that the health of the state depends on the exertions of individuals for their personal benefit.

INDO-ARYAN LANGUAGES. "Indo-Aryan" is the name generally adopted for those Aryans who entered India and settled there in prehistoric times, and for their descendants. It distinguishes them from the other Aryans who settled in Persia and elsewhere, just as the name "Aryo-Indian" signifies those inhabitants of India who are Aryans, as distinguished from other Indian races, Dravidians, Mundas and so on. A synonym of "Aryo-Indian" is "Gaudian" or "Gaurian," based on a Sanskrit word for the non-Dravidian parts of India proper. These two words refer to the people from the point of view of India, while "Indo-Aryan" looks at them from the wider aspect of Indo-European ethnology and philology. The general history of the Aryan languages is treated in the articles INDO-EUROPEAN LANGUAGES and ARYAN. Here we propose to offer a brief review of the special course of their development in India.

Most of the Indo-Aryans branched off from the common Aryan stock in the highlands of Khokand and Badakshan, and marched south into what is now eastern Afghanistan. Here some of them settled, while others entered the Punjab by the valley of the river Kabul. This last migration was a gradual process extending over several centuries, and at different epochs different tribes came in, speaking different dialects of the common language. The literary records of the latest times of this invasion show us one Indo-Aryan tribe complaining of the unintelligible speech of another, and even denying to it the right of common Aryan-hood.

The Piśāca Languages.—Before proceeding farther, it is advisable to discuss the fate of another small group of languages spoken in the extreme north-west of India. After the great fission which separated the main body of the Indo-Aryans from the Iranians, but before all the special phonetic characteristics of Iranian speech had developed, another horde of invaders crossed the Hindū Kush from the Pāmirs, journeying directly south. They occupied the submontane tract, including the country round Chitral and Gilgit, Kashmir and Kafiristan. Some even followed the course of the Indus as far as Sind, and formed colonies there and in the western Punjab. Here they mingled with the Indo-Aryans who had come down the Kabul valley, and to a certain extent infected the local dialect with their idioms. How far their influence extended over the rest of India is undecided, and will probably never be known, but traces of it have been detected by some inquirers even in the dialects of modern Marathi. Those who remained behind in the hill country, the whole of which is popularly known as Dardistan, were isolated by the inhospitable nature of their home and by their own savage character. They seem to have had customs allied to cannibalism, and in later Indian literature legends grew around them as a race of demons called *Piśācas*, ὠμοφάγοι, who spoke a barbaric tongue called *Paiśācī*. This language appears now and then in the Sanskrit drama, and Sanskrit philologists wrote still-extant grammatical notices of its peculiarities. These show that it possessed an extremely archaic character, and the same fact is prominent in the Piśāca languages of the present day. Some words which were spoken in the oldest time are preserved with hardly a change of letter, while in India proper the corresponding forms have either disappeared altogether or have been so changed as to be hardly recognizable at first sight. The principal modern Piśāca languages are three or four spoken in Kafiristan, Khōwar of Chitral, Shīnā of Gilgit, Kāshmīrī, and Kōhistānī. The last two are border tongues, much mixed with the neighbouring languages of India proper. The only one which has any literature is Kashmiri (*q.v.*). The rest are entirely uncultivated. Their general character may be described as partly Indian and partly Iranian, although they have in their isolated position developed some phonetic laws of their own.

Indo-Aryan Classification.—The oldest specimens of Indo-Aryan speech which we possess very closely resemble the oldest Iranian (see PERSIA: *Language*). There are passages in the Iranian Avesta which can be turned into good Vedic Sanskrit by the application of a few simple phonetic laws. It is sufficient for our present purposes to note that after the separation the development of the two old forms of speech went on independently and followed somewhat different lines. This is most marked in the treatment of a nexus of two consonants. While modern Iranian often retains the nexus with little or no alteration, modern Indo-Aryan prefers to simplify it. For instance, while the old Aryan *sth* becomes $s^{i}t$ or *ist* in modern Persian, it becomes *tth* or *th* in modern Indo-Aryan. Similarly *bhr* becomes $b^{i}r$ in the former, but *bbh* or *bh* in the latter. Thus:—

Old Indo-Aryan.	Old Iranian.	Modern Persian.	Hindī.
sthāna-	*stāna-*	$s^{i}t\bar{a}n$ or *istān*	*thānā*, a place.
bhrātar-	*brātar-*	$b^{i}r\bar{a}dar$	*bhāī*, a brother.

The earliest extant literary record of Indo-Aryan languages is the collection of hymns known as the Rig-Veda. As we have it now, we may take it as representing, on the whole, the particular vernacular dialect spoken in the east of the Punjab and in the upper portion of the Gangetic Doab where it was compiled. The tribe which spoke this dialect spread east and south, and their habitat, as so extended, between the Punjab and the modern Allahabad and reaching from the Himalaya to the Vindhya Hills in the south, became known to Sanskrit geographers as the *Madhyadēśa* or "*Midland*," also called *Āryāvarta*, or the "home of the Aryans." The language spoken here received constant literary culture, and a refined form of its archaic dialect became fixed by the labours of grammarians about the year 300 B.C., receiving the name of *Saṁskṛta* (Sanskrit) or "purified," in contradistinction to the folk-speech of the same tract and to the many Indo-Aryan dialects of other parts of India, all of which were grouped together under the title of *Prākṛta* (Prakrit) or "natural," "unpurified." Sanskrit (*q.v.*) became the language of religion and polite literature, and thus the Midland, the native land of its mother dialect, became accepted as the true pure home of the Indo-Aryan people, the rest being, from the point of view of educated India, more or less barbarous. In later times, the great *lingua franca* of India, Hindostani, also took its origin in this tract.

Round the Midland, on three sides—west, south and east—lay a country inhabited, even in Vedic times, by other Indo-Aryan tribes. This tract included the modern Punjab, Sind, Gujarat, Rajputana with the country to its east, Oudh and Behar. Rajputana belongs geographically to the Midland, but it was a late conquest, and for our present purposes may be considered as belonging to the Outer Band. The various Indo-Aryan dialects spoken over this band were all more closely related to each other than was any of them to the language of the Midland. In fact, at an early period of the linguistic history of India there must have been two sets of Indo-Aryan dialects,—one the language of the Midland and the other that of the Outer Band.[1] Hoernle was the first to suggest that the dialects of the Outer Band represent on the whole the language of the earlier Indo-Aryan immigrants, while the language of the Midland

[1] Attempts have been made to discover dialectic variations in the Veda itself, and, as originally composed in various parts of the Punjab widely distant from each other, the hymns probably did contain many such. But they have been edited by compilers whose home was in the Midland, and now their language is fairly uniform throughout. In the time of Asōka (250 B.C.) there were at least two dialects, an eastern and a western, as well as another in the extreme north-west. The grammarian Patañjali (150 B.C.) mentions the existence of several dialects.

was that of the latest comers, who entered the Punjab like a wedge and thrust the others outwards in three directions.

As time went on, the population of the Midland expanded and forced the Outer Band into a still wider circuit. The Midland conquered the eastern Punjab, Rajputana with Gujarat (where it reached the sea) and Oudh. With its armies and its settlers it carried its language, and hence in all these territories we now find mixed forms of speech. The basis of each is that of the Outer Band, but the body is that of the Midland. Moreover, as we leave the Midland and approach the external borders of this tract, the influence of the Midland language grows weaker and weaker, and traces of the original Outer language become more and more prominent. In the same way the languages of the Outer Band were forced farther and farther afield. There was no room for expansion to the west, but to the south it flowed over the Maratha country, and to the east into Orissa, into Bengal and, last of all, into Assam.

The state of affairs at the present day is therefore as follows: There is a Midland Indo-Aryan language (Western Hindi) occupying the Gangetic Doab and the country immediately to its north and south. Round it, on three sides, is a band of mixed languages, Panjabi (of the central Punjab), Gujarati, Rajasthani (of Rajputana and its neighbourhood), and Eastern Hindi (of Oudh and the country to its south). Beyond these again, there is the band of Outer Languages (Kashmiri, with its Pisaca basis), Lahnda (of the western Punjab), Sindhi (here the band is broken by Gujarati), Marathi, Oriya (of Orissa), Bihari, Bengali and Assamese. There are also, at the present day, Indo-Aryan languages in the Himalaya, north of the Midland. These belong to the Intermediate Band, being recent importations from Rajputana. The Midland language is therefore now enclosed within a ring fence of Intermediate forms of speech.

We have seen that the word "Prakrit" means "natural" or "vernacular," as opposed to the "purified" literary Sanskrit. From this point of view every vernacular of India, from the earliest times, is a Prakrit. The Rig-Veda itself, composed long before the birth of "purified" Sanskrit, can only be considered as written in an old vernacular, and its language, together with the other contemporary Indo-Aryan dialects which never attained to the honour of "purification," may be called the *Primary* Prakrits of India. If we compare literary Sanskrit with classical Latin (see Brandreth, "The Gaurian compared with the Romance Languages," *Journal of the Royal Asiatic Society* xi. (1879), 287; xii. (1880), 335), then these Primary Prakrits correspond to the old Italic dialects contemporary with and related to the literary language of Rome. They were synthetic languages with fairly complicated grammars, no objection to harsh combinations of consonants, and several grammatical forms strange to the classical speech. In the course of centuries (while literary Sanskrit remained stereotyped) they decayed into *Secondary* Prakrits. These still remained synthetic, and still retained the non-classical forms of grammar, but diphthongs and harsh combinations of consonants were eschewed. They now corresponded to the post-classical Italic dialects. Just as Sanskrit (and the Primary Prakrits) knew of a city called Kauśāmbī, which was known as Kōsambī to the Secondary Prakrits, so the real Umbrian name of the poet known to literature as Plautus was Plot(u)s. Again, as the Latin *lactuca* became *lattuca*, so the Primary Prakrit *bhakta-* became the Secondary *bhatta-*. In India, the dislike to harsh consonantal sounds, a sort of glottic laziness, finally led to a condition of almost absolute fluidity, each word of the Secondary Prakrits ultimately becoming an emasculated collection of vowels hanging on to an occasional consonant. This weakness brought its own Nemesis and from, say, A.D. 1000 we find in existence the series of modern Indo-Aryan vernaculars, or, as they may be called, *Tertiary* Prakrits, closely corresponding to the modern Romance languages. Here we find the hiatus between contiguous vowels abolished by the creation of new diphthongs, declensional and conjugational terminations consisting merely of vowels becoming worn away, and new languages appearing, no longer synthetic, but analytic, and again reverting to combinations of consonants under new forms, which had existed three thousand years ago, but which two thousand years of attrition had caused to vanish.

It is impossible to fix any approximate date for the change from the Primary to the Secondary Prakrits. We see sporadic traces of the secondary stage already occurring in the Rig-Veda itself, of which the canon was closed about 1000 B.C. At any rate Secondary Prakrits were the current vernacular at the time of the emperor Asoka (250 B.C.). Their earliest stage was that of what is now called *Pāli*, the sacred language of the Buddhists, which forms the subject of a separate article (see PALI). A still later and more abraded stage is also discussed under the head of PRAKRIT. This stage is known as that of the Prakrit *par excellence*. When we talk of Prakrit without any qualifying epithet, we usually mean this later stage of the Secondary Prakrits, when they had developed beyond the stage of Pāli, but before they had reached the analytic stage of the modern Indo-Aryan vernaculars. The next, and final, stage of the Secondary Prakrits was that of the *Apabhraṁśas*. The word *Apabhraṁśa* means "corrupt" or "decayed," and was applied to the vernaculars in contrast to the Prakrit *par excellence*, which had in its turn (like Sanskrit and Pali) become stereotyped by being employed for literature. It is these *Apabhraṁśas* which are the direct parents of the modern vernacular. The following is a list of the Indo-Aryan vernaculars, showing, when known, the names of the *Apabhraṁśas* from which they are sprung, and the number of speakers of each in the year 1901:—

Apabhraṁśa.	Modern Language.	Number of Speakers.
	A. Language of the Midland.	
Śaurasēna . . .	Western Hindī	40,714,925
	B. Intermediate Languages.	
Āvanta . . .	Rājasthānī	10,917,712
„ . . .	Pahāṛī Languages	3,124,681
Gaurjara . . .	Gujarātī	9,439,925
Śaurasēna . . .	Pañjābī	17,070,961
Ardhamāgadha .	Eastern Hindī	22,136,358
	C. Outer Languages.	
	(a) North-Western Group.	
Unknown . . .	Kāshmīrī (with a Piśāca basis)	1,007,957
„ . . .	Kōhistānī (with a Piśāca basis)	(unknown)
„ . . .	Lahndā or Western Pañjābī	3,337,917
Vrācaḍa . . .	Sindhī	3,494,971
	(b) Southern Language.	
Māhārāṣṭra . .	Marāṭhī	18,237,899
	(c) Eastern Group.	
Māgadha . . .	Bihārī	34,579,844
„ . . .	Oṛiyā	9,687,429
„ . . .	Bengali	44,624,048
„ . . .	Assamese	1,350,846
	Total . . More than	219,725,473

Of these, the Pahāṛī languages are offshoots of Rājasthānī imported into the Himalaya. Kōhistānī includes the mixed dialects of the Swat and Indus Kohistans. The census of 1901 did not extend to these tracts. A full account of the *Apabhraṁśas* will be found in the article PRAKRIT.

Although the modern Indo-Aryan vernaculars are not derived from Sanskrit, and though all, or nearly all, are not derived from the language of the Rig-Veda, nevertheless, as these are almost the only sources of our information as to what the Primary Prakrits of India were, and as all Primary Prakrits were related to these two and were in approximately the same stage of phonetic development, they afford a convenient means for carrying out historical investigation into the origin of all the modern Indo-Aryan vernaculars to its legitimate conclusion. At the same time they are not always trustworthy guides, and sometimes fail to explain forms derived from other ancient contemporary dialects, the originals of which were unknown to the Vedic and classical literature. A striking example is the origin of the very common locative suffix *-ē*. This can be traced through the *Apabhraṁśa -hi* to the Pali *-dhi*. There all Indian clues cease, and it is not till we recognize its relationship to the Greek *-θι* that we understand that it is an ancient Indo-European termination kept alive in India by some of the Primary Prakrits, but ignored both by the dialect of the Rig-Veda and by literary Sanskrit. With this reservation, a short comparison of Sanskrit with the Secondary and Tertiary Prakrit developments will be of interest. As the Pali and Prakrit stages are fully treated under their proper heads, very brief references to them will be sufficient.

A. Vocabulary.—The ground of all the vocabularies of the modern Indo-Aryan vernaculars is, of course, the vocabulary of Aryan India in the Vedic period. Thousands of words have descended from the earliest times and are still in existence, after passing through certain changes subject to well-known phonetic laws. As many of these laws are the same for every language, it follows that a large stock of words, which principally differ in inflection, is common to all these modern forms of speech. These words, which natives believe to be derived from Sanskrit itself, are called by them *tadbhava, i.e.* " having ' that ' (*sc.* Sanskrit, or, more correctly, the Primary Prakrit) for its origin." As the language of the Midland is derived from the old dialect of which Sanskrit is the " polished " form, it is approximately true to say that it is derived from that form of speech, and its native vocabulary (allowing for phonetic development) may be said to be the same as that of Sanskrit. But the farther we go from the Midland, the more examples we meet of a new class of words which natives of India call *dēśya* or " country-born." Most of these are really also *tadbhavas*, descendants of the old Primary Prakrit dialects spoken outside the Midland, of whose existence native scholars took no account. Finally, owing to the ever-present influence of literary Sanskrit, words are, and have been for many generations, borrowed direct from that language. Some of these borrowed words are due to the existence of Sanskrit as the language of religion. Their use is paralleled by the employment of Greek and Latin words for religious technical terms in all the languages of Europe. Others are technical terms of arts and sciences, but most of those which we meet are simply employed for the sake of fine language, much as if some purist were to insist on employing *hlāford* instead of " lord " in writing English. These Sanskrit words are known as *tatsama* or " the same as ' that ' (*sc.* Sanskrit)." The number of *tatsamas* employed varies much. In languages such as Panjabi which have little or no literature, and in the speech of the peasantry all over India, they are few in number. In the modern literary Bengali a false standard of literary taste has led to their employment in overwhelming numbers, and the homely vigorous home-speech, which is itself capable of expressing every idea that the mind of man can conceive, flounders about awkwardly enough under the weight of its borrowed plumes. The native vocabulary of the modern Indo-Aryan vernaculars is thus made up of *tadbhavas, dēśyas* and *tatsamas*.

The Dravidian languages of southern India have also contributed a small quota to the Indo-Aryan vocabulary. Most of the words have been given a colour of contempt in the process of borrowing. Thus the word *pillā*, a cub, is really the Dravidian *pillai*, a son. But the most important accretion from outside comes from Persian, and (through Persian) from Arabic. This is due to Mahommedan influence. In the Mogul courts Persian was for long the language of politeness and literature, and words belonging to it filtered into all stages of society. The proportion of these Persian words varies greatly in the different languages. In some forms of Western Hindī they have almost monopolized the vocabulary, while in others, such as Bengali and Marathi, the number is very few. Instances of borrowing from other languages are of small importance.

B. Phonetics.—The alphabet of the Indo-Aryan languages is, on the whole, the same as that of Sanskrit (*q.v.*), and the system of transliteration adopted for that language is also followed for them.[1] Some new sounds have, however, developed in the Secondary and Tertiary Prakrits. New signs will be used for them, and will be explained in the proper places. Sanskrit knew only long *ē* and *ō*, but already in the Secondary Prakrits we find a corresponding short pair, *e* and *o*, of which the use is considerably extended in the tertiary stage. The Sanskrit diphthongs *āi* and *āu* disappeared in the secondary stage, *ē* and *ō* being substituted for them respectively. On the other hand, in the same stage, we frequently come across pairs of vowels, such as *aï, aü*, with a hiatus between the two members. In the tertiary stage, these pairs have been combined into new diphthongs *ai* and *au*, shorter in pronunciation than *āi* and *āu*. The pronunciation of *āi* and *ai* may be compared with that of the English " aye " and " I " respectively. In the languages of the Outer Band, there is again a tendency to weaken this new *ai* to *ē*, and the new *au* to *ō*. All the tertiary languages weaken a short final vowel. In most it is elided altogether in prose, but in some of those of the Outer Band (Kashmiri, Sindhi and Bihari) it is half pronounced. Some of the Outer languages have also developed a new *a*-sound, corresponding to that of *a* in the German *Mann*. The stress-accent of classical Sanskrit has as a rule been preserved throughout. In the tertiary stage it generally resolves itself into falling on the ante-penultimate, if the penultimate is short. If the latter is long it takes the accent. In the eastern languages there is a tendency to throw the accent even farther back. There is also everywhere a tendency to lighten the pronunciation of a short vowel after an accented syllable, so that it is barely audible. Thus, *cálᵃtā* for *cálatā*. In some dialects, *e.g.* the Urdu form of Western Hindi, this " imperfect " vowel has altogether disappeared, as in *cáltā*.

The tertiary languages have on the whole preserved the consonantal system of the secondary stage, preferring, however, as a rule, to simplify double consonants, with compensatory lengthening of the preceding vowel. Thus, for Sanskrit *hasta-*, a hand, we have Secondary Prakrit *hattha-*, Tertiary *hāth*. Some tertiary languages have both *hatth* and *hāth*: others (like Gujarati) have only *hāth*: while others (like Panjabi) have only *hatth*. In the extreme north-west, Sindhi and Lahnda, under the influence of the Pisaca languages, simplify the double consonant without compensatory lengthening, so that we have *hath*. Again, many languages of the Outer Band show a tendency to avoid aspiration, so that Kashmiri, Marathi, Bengali and others have *hāt*. It is well known that the Iranian languages change *s* to *h*. The Tertiary Prakrits of the Outer Band find analogous difficulty in pronouncing a sibilant. The north-western languages change it to *h* as in Persian. Marathi changes *s* to *ś* before palatal sounds, and the same change occurs in Bengali in the case of every uncompounded sibilant. Eastern Bengali and Assamese go farther. Here *s* is again sounded almost like *h*. On the other hand, in the Midland, *s* rarely becomes *h* and then only when medial. In the Outer languages the palatal consonants are also liable to change; *j* and *jh* approach the sound of *z*, and *c* and *ch* often become *ts*, or, in the East, a simple *s*. Thus, the Midland *cākar*, a servant, is pronounced *tsākar* in Marathi, and the Midland *māch*, a fish, is sounded *mās* in Marathi, Bengali and Assamese.

C. Declension.—In the latest stage of the Secondary Prakrits the neuter gender begins to disappear, and in the tertiary stage, except in Gujarati and Marathi, it is nearly altogether wanting. Elsewhere we only come across occasional relics of its employment. In some of the tertiary languages grammatical gender, as distinct from sexual gender, has disappeared as entirely as it has in English. The dual number had already fallen into disuse in the Secondary Prakrits. In the secondary stage we see a gradual simplification of grammatical form and a disappearance of case endings. The complicated Sanskrit system is more and more superseded by the simple uniformity of the declension of *a*-bases. One by one the case endings were discarded, and cases were confounded with one another till at length in *Apabhraṁśa* only one or two forms remained for each number. In the tertiary stage there remain in most languages only two cases, which we may call the nominative and the oblique. The latter can be employed for any case except the nominative, but the sense is usually defined by the aid of help-words called postpositions.[2] It is a linguistic rule that languages in which the genitive precedes the governing noun prefer suffixes to prefixes and vice versa;[3] and, as the genius of the Indo-Aryan languages does require the genitive to be prefixed, these help-words take the form of suffixes. In the Midland they are still separate words, but in the Outer Band each has in general become incorporated with the main word to which it is attached. Thus, the Midland *ghōṛā*, a horse, has its oblique form *ghōṛē*, genitive *ghōṛē kēr*, but Bengali has oblique form *ghōṛā*, genitive *ghōṛār* contracted from *ghōṛā*+(*k*)*ar*. The ground principles of declension in all tertiary languages are the same, but as each employs different postpositions the systems of declension vary considerably. Marathi is the only true Indo-Aryan language which has preserved anything more than sporadic relics of the old system of case terminations.

D. Conjugation.—Two tenses, the present and the imperative, of the old synthetic system of conjugation have survived in all the Tertiary Prakrits, and in some of them we also find the ancient future. All other tenses are now made periphrastically, mostly with the aid of participles to which auxiliary verbs may or may not be added. The participles employed are all survivals of the old participles of the present, of the past and (in some languages) of the

[1] The Nāgarī (see SANSKRIT) and allied alphabets, when employed for modern Indo-Aryan languages or for Prakrit, are transliterated in this work according to the following system:—
a ā i ī u ū ṛ ṝ e ē ai āī o ō au āū ṁ (*anusvāra*) ∞ (*anunāsika*) ḥ (*visarga*).
k kh g gh ṅ
c (ts) ch (tsh) j (dz) jh (dzh) ñ
ṭ ṭh ḍ (ṛ) ḍh (ṛh) ḷ ḷh ṇ
t th d dh n
p ph b bh m
y r l v (w)
ś ṣ s h.

Special sounds employed by particular languages are described in the articles in which reference is made to them. Here we may mention *å*, sounded like the *aw* in " law," and *ä, ö, ü*, pronounced as in German.

[2] The origin of the postpositions is discussed in the article HINDOSTANI.

[3] See P. W. Schmidt in *Mitteilungen der Wiener Anthropologischen Gesellschaft*, xxxiii. 381.

future. The past and future participles are passive in their origin, and hence tenses formed with these participles must be construed passively. Thus, instead of "I struck him" we must say, either "he was struck by me," or else (impersonally) "it was struck by me with reference to him." So, for an intransitive verb we have, either "I am gone," or "it is gone by me." In the language of the Midland this is quite simple and clear, but in those of the Outer Band the subject (in the instrumental, or as it is usually called "agent" case) is indicated by means of pronominal suffixes attached to the participle or auxiliary verb; thus (Bengali) *mārila+am*, struck+by-me, becomes *mārilām*, I struck. In such cases all memory of the passive meaning of the participle is lost by the eastern languages, and it, together with the appropriate pronominal suffixes, becomes in appearance and in practical use an ordinary past tense conjugated as in Latin or in Sanskrit. It is an instance of reversion to the original type; first synthetic, then analytic, and then again a new synthetic conjugation. In the other languages of the Outer Band, the memory of the passive nature of the participle is retained, although the conjugation is as synthetic as in the East, and the subject has to be put into the "agent" case.

AUTHORITIES.—No work has yet been published dealing with Indo-Aryan subjects as a whole, although several have been written which treat of one or more stages of their development. For the general question of the Piśāca languages, the reader may consult G. A. Grierson's *The Piśāca Languages of North-Western India* (London, 1906). For the different languages of this group, see G. W. Leitner, *Dardistan* (Lahore, 1877); J. Biddulph, *Tribes of the Hindoo Koosh*, (Calcutta, 1880); D. J. O'Brien, *Grammar and Vocabulary of the Khowār Dialect* (Lahore, 1895); J. Davidson, *Notes on the Bashgali (Kāfir) Language* (Calcutta, 1901). For the linguistic conditions of Vedic times, the Introduction to J. Wackernagel's *Altindische Grammatik* (Göttingen, 1896) gives much useful information in a convenient form. For the literature concerning Pāli and Prakrit, see under those heads. The following are the principal works dealing with the general question of the Tertiary Prakrits: J. Beames, *Comparative Grammar of the Modern Aryan Languages of India* (1872–1879); A. F. R. Hoernle, *A Grammar of the Eastern Hindi compared with the other Gaudian Languages* (1880); R. G. Bhandarkar, "The Phonology of the Prakrits of Northern India," in the *Journal of the Royal Asiatic Society* (Bombay Branch), vol. XVII., ii., 99-182 (see also the same author's series of papers on cognate subjects in vol. XVI. of the same *Journal*); and G. A. Grierson's essays "On the Phonology of the Modern Indo-Aryan Vernaculars" in the *Zeitschrift der deutschen morgenländischen Gesellschaft*, vols. xlix., l. (1895–1896), 393, 1; "On the Radical and Participial Tenses of the Modern Indo-Aryan Vernaculars" in the *Journal of the Asiatic Society of Bengal*, vol. lxiv. (1895), part i., 352; and "On certain Suffixes in the Modern Indo-Aryan Vernaculars" in the *Zeitschrift für vergleichende Sprachforschung* (1903), p. 473. The general subject of this article is discussed at greater length in chapter vii. of the *Report on the Census of India, 1901* (Calcutta, 1903). The volumes of the *Linguistic Survey of India* also contain much detailed information, summed up at length in the introductory volume. (G. A. Gr.).

INDO-CHINA, FRENCH.[1] The geographical denomination of French Indo-China includes the protectorates of Annam, Tongking and Cambodia, the colony of Cochin-China and part of the Laos country. In 1900 the newly-acquired territory of Kwang-Chow Bay, on the coast of China, was placed under the authority of the governor-general of Indo-China. Cochin-China, a geographical definition which formerly included all the countries in the Annamese empire—Tongking, Annam and Cochin-China—now signifies only the French colony, consisting of the "southern provinces" originally conquered from Annam, having Saigon as its capital. In its entirety French Indo-China, the eastern portion of the Indo-Chinese peninsula, lies between 8° 30′ and 23° 25′ N. and 100° and 109° 20′ E. It is bounded N. by China, on which side the frontiers have been delimited; E. and S.E. by the Gulf of Tongking and the China Sea; W. by the Gulf of Siam and Siam, and N.W. by Burma. The area is estimated at about 290,000 sq. m., with a population of $17\frac{1}{4}$ millions, of whom 75 or 80% are Annamese. The French inhabitants number about 13,000.

The configuration of the country is determined by two rivers of unequal importance—the Mekong and the Song-Koi—and a continuous chain of mountains, an offshoot of the great Chinese group of Yun-nan, which, making a double curve, forms an immense S. South and west of this mountain chain the country forms part of the Mekong basin. To the north and north-east of the chain the valley of the Song-Koi, or Red river, constitutes almost the whole of Tongking, of which its delta represents the most fertile and populous if not the largest portion. The small mountainous provinces of Lang-Son, That-Ke and Kao-Bang, however, belong geographically to the Si-Kiang basin. On the east the small province of Mon-Kay, on the borders of Kwang-Tung, forms a little basin enclosed between the mountains and the sea; on the south the province of Thanh-Hoa, although crossed by the small river Song-Ma, forms the extremity of the Red river delta and belongs to it, the two rivers being united at some distance from the sea by a natural channel formed by the junction of a northern branch of the Song-Ma with a southern branch of the Song-Koi. The Red river descends from the mountains of Yun-nan, rising near Tali-fu between deep and inaccessible gorges, and becomes navigable only on its entry into Tongking. Means have been taken to render it available to steam launches, and in consequence of an agreement between the state and the Compagnie des Correspondances Fluviales a service of steamers is provided from its mouth to Lao-Kay. Near Hung-Hoa the Red river receives its two chief tributaries, the Black river from the plateaus of the west—the land of the Muongs—and the Clear river, one of the largest of whose tributaries issues from the Ba-Be lakes. The Black river is navigable for a considerable distance, the Clear river only from Tuyen-Kwang. Between the basins of the Song-Koi and the Mekong the chain of mountains, crowned by tolerably extensive plateaus, covers, with its ramifications and transverse spurs, a vast extent of country little known, although several trade-routes traverse it, thus placing the Laos country in communication with Tongking and Annam. In about 19° N. the mountain-ridge approaches the sea and runs parallel to the coast, presenting on its eastern side a steep declivity which encloses a narrow littoral, in places only a mile or two broad, between the base of its cliffs and the shore. This coast-belt constitutes the habitable and cultivable portion of Annam proper, and consists of alluvial matter accumulated at the mouths of mountain streams, and marshes and swamps enclosed between land and sea by sand ridges heaped up by wind and tide. The high valleys and plateaus originally belonged to the empire, the limits of which, although invaded and occupied by Siamese, formerly extended to the banks of the Mekong. The western slopes form part of the French Laos possessions. The Mekong valley includes Laos, Cambodia and the greater part of Cochin-China. The Mekong (*q.v.*) is one of the largest rivers of south-eastern Asia, having a course 1900 m. in length. Its mouths, six in number, communicate by means of a navigable canal with the Saigon river (fed by the Don-Nai and the two Vaico rivers), which is navigable by the largest warships, rendering Saigon the most important natural port of Indo-China.

Geology.—The deltaic tracts of the Mekong and Red river are composed of alluvium (generally silicious clay) deposited by the rivers. The mountains from which this soil is derived are granitic in formation, the framework being almost always schists of ancient date, dislocated, folded and occasionally rounded into hills 1000 to 1300 ft. in height, belonging to the Devonian period. Above these schists lie—more especially in the north and south of Tongking—marbles and other highly crystalline limestones, upon which rest, unconformably in places (Nong-Son, Ke-Bao, Hon-Gáy), Carboniferous formations. In the upper part of the Red river valley rich deposits of coal have been found between Yen-Bay and Hai-Duong, in a considerable tract of Tertiary rock. Limestone occurs also in the valley of the Mekong, forming an extensive *massif* in the district of Lakhon and in the basins of the Nam-Ka-Dinh and Nam-Hin-Bun. These limestones appear to be Carboniferous. In the region south of Lakhon the rock is Triassic, and gold has been found in several districts. The natives collect it in very small quantities by a washing process. In the lateral valleys of the Mekong copper and tin are found. On the course of the Nam-Paton, a tributary of the Nam-Hin-Bun, the natives work a moderately productive tin-mine. Layers of spiegeleisen, limonite and other iron ores are numerous in the Laos states, in which also antimony occurs.

Climate.—The climate of Indo-China is that of an inter-tropical country, damp and hot. But the difference between the southern and northern regions is marked, as regards both temperature and meteorology. Cochin-China and Cambodia have very regular seasons, corresponding with the monsoons. The north-easterly monsoon blows from about the 15th of October to the 15th of April, within a day or so. The temperature remains almost steady during this time, varying but slightly from 78·8° to 80·6° F. by day to 68°

[1] See also ANNAM, CAMBODIA, COCHIN-CHINA, KWANG-CHOW BAY, LAOS, TONGKING.

by night. This is the dry season. From the 15th of April to the 15th of October the monsoon reverses, and blows from the south-west. The season of daily rains and tornadoes commences. The temperature rises from 80·6° to 84·2°, at which it remains day and night. April and May are the hottest months (from 86° to 93·2°). The damp unwholesome heat sometimes produces dysentery and cholera. The climate of Annam is less regular. The north-easterly monsoon, which is "the ocean-wind," brings the rains in September. The north-easterly gales lower the temperature below 59°. September is the month in which the typhoon blows. During the dry season—June, July and August—the thermometer oscillates between 86° and 95°. The nights, however, are comparatively cool. Tongking has a winter season—October to May. The temperature, lowered by fog and the rains, does not rise above 75·2° and descends to 50° over the delta, and to 44·6° and even 42·8° in the highlands, where white frost is occasionally seen. The summer, on the other hand, is scorching. The wind veers to the south-east and remains there until October. The temperature rises to over 83°; often it reaches and continues for several days at 95° or even more. The nights are distressingly airless. The Laos country in the interior and lying at a high altitude is cooler and drier. Its deep valleys and high hills vary its climate.

Fauna and Flora.—From the populous cultivated districts wild animals, once plentiful, have retired towards the wooded and mountainous districts. The wild life of Laos includes fairly numerous herds of elephants, the rhinoceros (one- and two-horned; rhinoceros horn is employed as a "medicine"), tiger, panther, brown bear, tree-bear, monkeys and rats, among which are the musk rat, the palm rat and the *nu-khi*, or rat found in the rice-fields of the highlands, in which its ravages are considerable. In mountain districts the leopard, wild boar and deer are found, and in the neighbourhood of habitations the tiger-cat and ichneumon. The buffalo is commonly found wild in Laos; as a domesticated animal it also holds a prominent place. The zebu bull is used for transport purposes. Attempts to acclimatize the Arab horse and to introduce sheep from Aden and China have failed. There is, however, an indigenous race of horses, excellent in spite of their small size—the horses of Phu-Yen. Among birds the woodcock, peacock and numerous species of duck inhabit the woods and marshes. The goose and guinea-fowl appear, as also the turkey, to have become easily acclimatized. Reptiles (apart from the caimans of the Mekong, which attain a length of over 30 ft., and are much appreciated by the Annamese as food) are extremely numerous and varied in species. The rivers are rich in fish. The sole is found in the rivers of Tongking. The Mekong is fished for two species peculiar to it—the *pa-beuk* and the *pa-leun*, which attain a length of nearly 6 ft. All varieties of mosquitoes, ants and leeches combine to render the forests bordering the Mekong impracticable. Peculiar species of grubs and caterpillars destroy the cotton and coffee plantations of Cochin-China. The silkworm may be said to be indigenous in Tongking, where there are several thousand acres of mulberry trees.

The flora is inter-tropical, and comprises nearly all the trees known in China and Japan. The bamboo is utilized in building and a variety of other ways. Formerly the teak was believed not to exist in the forests of Indo-China, but it was found some years ago in considerable abundance, and plantations of it have been made. Certain hard woods are used for marqueterie and other ornamental work. Rubber is also exploited. Cotton, previously cultivated in Cochin-China and Cambodia, gives excellent results in Laos. Tea, of which there are a certain number of plantations in the highlands of Tongking and Annam, grows wild in Upper Laos, and in quality closely resembles the Pou-eurl or Pueul variety noted in Yun-nan. Cocoa, coffee and cotton are cultivated in Tongking and Cambodia. Cinnamon and cardamoms are gathered in Laos and Annam. Ground nuts, sesame, sugar canes, pepper, jute, tobacco and indigo are also grown. The area under rice, which is incomparably the most important crop, is approximately 1,750,000 acres. All European fruits and vegetables have been introduced into Tongking, and with certain exceptions—the grape, for example—succeed perfectly. Measures taken to secure the monopoly of opium have notably increased the cultivation of the poppy.

People.—The population of French Indo-China falls into five chief divisions—the Annamese, forming the bulk of the population in Annam, Tongking and Cochin-China and four-fifths of that of the whole country; the Khmers or Cambodians; the Chams of southern Annam; the Thais, including the Laotians; and the autochthonous tribes classed by the other inhabitants as Mois or Khas ("savages"). Driven into the interior by the now dominant races, these older people have mixed and blended with the peoples whom they found there, and new tribes have arisen, intermingled with fugitives from China, Annam and even Siam. In the north of Tongking people of Laos origin occur—the Thōs round Kaobang, the Muongs in the mountains bordering the Red river. When mixed with Chinese the Muongs and the Thōs are known as the Hung-dans, Māns and Miens. The Muongs are bigger and stronger than the Annamese, their eyes often almost straight. They have square foreheads, large faces and prominent cheek-bones. In the centre and south of the Indo-Chinese mountain chain are found, under a multiplicity of names—Phon-tays, Souis, Bah-nan, Bolovens, Stiengs, Mors, Kongs, &c.—people of Malayan origin mixed with all the races of Indo-China. Laos is inhabited by an essentially miscellaneous population—falling into three main groups—the Thais; various aboriginal peoples classed as Khās; and the Moos and Yaos, tribes of Chinese origin.

Religions.—The Annamese religion is a somewhat vague and very tolerant Buddhism, which in practice resolves itself chiefly into the worship of ancestors. Certain ceremonies performed in Cambodia resemble distantly the Brahminical cult. The Roman Catholic religion has been introduced by missionaries. The course of its history has not been free from catastrophes and accidents. There is an apostolical vicariate in Cochin-China, one in Cambodia and several mission stations in Tongking. Two of these missions are mainly conducted by Spanish priests.

Administration.—Before taking its present form the governmental organization of Indo-China underwent many changes. Originally Cochin-China, the only French possession in the peninsula, was a colony directly administered, like other colonies, by the ministry of marine, and its earliest governors were admirals. Later, as further conquests were effected, Tongking and Cambodia were subjected to the régime of a protectorate somewhat ill-defined, and placed under the authority of residents-general. The seat of the resident-general of Tongking was at Hanoi; of Cambodia, at Pnom-Penh. The government of the colonies having been transferred (1889) from the ministry of marine to the ministry of commerce, and in 1894 to the newly created ministry of the colonies, the control of the residencies passed gradually into the hands of civil agents. Cochin-China, which already by the decree of the 8th of February 1880 had been endowed with a colonial council, had a municipality, a chamber of commerce, and even a deputy in the French parliament. There had thus been three distinct states, each with its own ruler and government. But by the decrees of the 17th of October and the 3rd of November 1887 the unity of Indo-China was determined. By decree of October the post of director of the interior of Cochin-China was done away with and replaced by that of lieutenant-governor under the immediate authority of a governor-general. The functions and powers of the latter official were, however, but vaguely defined before the decree of the 21st of April 1891, which conferred on M J. M. A. de Lanessan, appointed governor-general, the most extensive powers. The residents-general of Tongking, Annam and Cambodia, and the lieutenant-governor of Cochin-China, as well as the military authorities, were placed under him. But this change of policy, which put an end to the system of expeditions and minor military operations, and restricted the power of the residents whilst restoring to the mandarins a share of authority, was unwelcome to numerous interests, which, combining, secured the abrupt recall of M de Lanessan on the 29th of December 1894. The decree of the 21st of April 1891 was not, however, revoked, but the powers it conferred were restricted. After the appointment of M Doumer, successor to M Rousseau, who died on the 10th of December 1896, this decree was again put in force on the former scale, and in 1898 it was supplemented by the decrees of the 3rd and 31st of July, which definitely established the political and financial unity of Indo-China. The governor-general is the sole intermediary between the Indo-Chinese Union and the home government, the powers of which, with few restrictions, are delegated to him. As supreme administrative and military authority, he directly controls the civil services, and, though prohibited from commanding in the field, disposes of the land and sea forces in the country. His diplomatic negotiations with foreign powers must be carried on under the authorization and surveillance of the home authorities. The governor-general is assisted by the Superior Council of Indo-China, which meets monthly, and as reorganized by the decree of the 8th of August 1898 is composed as follows: the governor-general (president); the general commanding as head of the troops; the rear-admiral commanding the naval squadron of the Far East; the lieutenant-governor of Cochin-China; the residents superior of Tongking, Annam, Cambodia and Laos; the director-general of finances; the director of the *contrôle financier*; the head of the judicial service of Indo-China; the director-general of the customs and excise of Indo-China; the directors-general of agriculture, forests and commerce; of public works; of posts and telegraphs; of health; and of public instruction; the treasurer-general of Indo-China; the director of the school of medicine at Hanoi; the president of the colonial council of Cochin-China; the presidents of the chambers of commerce of Saigon, Hanoi and Hai-Phong; the presidents of the united chambers of commerce and agriculture of Annam and Cambodia; the presidents of the chambers of agriculture of Tongking and Cochin-China; four influential natives; the chief of the cabinet and the governor-general's secretary. This list sufficiently indicates the departmental services, by means of which the general government is carried on. The Superior Council meets not only at Hanoi, the seat of the government, but also at Saigon, Hué and Pnom-Penh. It delegates its powers to a "permanent commission" consisting of thirteen of its members, and dispensing with the attendance of the local authorities of regions other than those in which the place of meeting is situated. The Superior Council meets annually to receive the general budget and the local budgets which "must be accepted by the governor-general at a session of the Superior Council."[1] It must also be consulted on the distribution of military credits, and on the credits to be devoted to public works. The *contrôle financier*, which scrutinizes and sanctions all measures of the public services involving outlay of money, is dependent on the ministry of the colonies. Its returns have to be communicated to the governor-general.

The governor-general is also assisted by a "council of defence," comprising the chief military and naval authorities.

Justice.—The whole of Indo-China is, in principle, subject to French justice, represented by a court of appeal and a certain number of tribunals. Before 1898 the administration of justice was not centralized. There was a court of appeal at Hanoi, and another at Saigon. But the decree of the 8th of August 1898 established one court of appeal for French Indo-China: two chambers sitting at Saigon and the other two at Hanoi. Three tribunals of commerce are established at Saigon, Hanoi and Hai-Phong. There are courts of first instance at Saigon, My-Tho, Vinh-Long, Ben-Tre, Chau-Doc, Kantho, Soc-Trang, Tra-vinh, Long-Xuyen for Cochin-China, at Pnom-Penh for Cambodia, and at Hanoi and Hai-Phong for Tongking. These courts are supplemented by *juges de paix* in Cochin-China, and there are *juges de paix* at Nam-Dinh (Tongking) and Tourane; elsewhere in the protectorates the residents perform judicial functions. There are criminal courts at Saigon, My-Tho, Vinh-Long and Long-Xuyen in Cochin-China, at Hanoi in Tongking and at Pnom-Penh in Cambodia. In Cochin-China Annamese law is administered in the French courts in suits between natives, but native tribunals have been superseded. In Annam-Tongking, outside the sphere of the French tribunals, the natives are subject to Annamese justice, represented in each province by a mandarin, called the *An Sat*, and in Cambodia the natives are subject to the native tribunals. At the same time, whenever a French subject or European or other foreigner is a party in an affair, French justice only is competent.

Public Works.—The order of the 9th of September 1898 placed the public works of Indo-China under the "direct authority of the governor-general as regards works entered to the general budget account." There is a director of public works in Indo-China at Saigon, a director of engineering in the other countries. In 1895 a "special service" was created in Tongking to consider railway business.

Posts and Telegraphs.—The country is divided into two sections for the purposes of this service, the one comprising Annam, Tongking and Upper Laos, the other Cochin-China, Cambodia and Lower Laos. The post and telegraph offices in Indo-China number about three hundred. Tourane communicates by submarine cable with Amoy in China, thence with Vladivostok and Europe.

The Army—Land Force.—The military services are under the authority of a general of division commanding in chief. The European troops in 1907 comprised four regiments of colonial infantry with 22 batteries of artillery (10 in Tongking and 12 in Cochin-China). The native troops, numbering over 18,000, comprised four regiments of Tongkingese *tirailleurs* (sharp-shooters), two of Annamese, a battalion of Cambodian and a battalion of Chinese *tirailleurs*, a squadron of Annamese *chasseurs* or light horse and two companies of engineers.

Sea Force.—Indo-China is protected by the naval division of the Far East. In addition five gunboats are stationed at Saigon and a third-class cruiser and some minor vessels at Hai-Phong.

The *Policing* of the country is performed by natives (the *garde indigène*) under European officers and by the *gendarmerie coloniale*, which is reinforced by native auxiliaries.

Money, &c.—The monetary unit is the *piastre*, which is of variable value, having fallen from 4·50 francs to 2·40 francs and fluctuating round that figure. The chief native coin is the *sapek* of zinc or tin, six hundred of which strung together form a *ligature*, a tenth of which is called a *tien*. The piastre is worth 2700 sapeks. The unit of weight, the *picul*, equals 60·4 kilos. (about 133 ℔); the *thuoc-moe* equals ·425 metre (about 17 in.).

Education.—The Annamese are intelligent and have old intellectual and artistic traditions. In consequence the promotion of education has been assigned to a special council (*Conseil de perfectionnement de l'enseignement*) selected from Frenchmen and Asiatics particularly qualified for membership. Among its preoccupations are the reconstitution of the schools of Chinese characters in Cochin-China, the remodelling of the programmes of the triennial examinations in Annam and Tongking (see ANNAM) with a view to completing them with a summary knowledge of French and science, the improvement of the teaching given in the pagodas in Cambodia and Laos, and the foundation of a university comprising classes for natives. In 1906, in Cochin-China, where the largest sum (£45,000 in 1906) is devoted to instruction, 22,500 children received a French education.

Finance.—The unification of the budget brought about by M Doumer (decree of the 31st of July 1898) specially contributed to that of the government. The financial scheme is based on the political. Just as a single central government directs the various local governments, so in addition to the general budget, comprising the revenue and expenditure of the supreme government, there are several local budgets, including the revenue and expenditure incidental to the individual provinces.

The general budget in 1899 and 1904 is summarized below:—

	Receipts.	*Expenditure.*
1899	£1,968,770	£1,639,800
1904	2,809,851	2,797,031

While direct taxes, *e.g.* the poll-tax and land tax or (in Cambodia) the tax on products, are the main sources of revenue for the local budgets, those for the general budget are the indirect taxes: (1) customs (£619,616 in 1904); (2) "régies" and other indirect taxes (£1,733,836 in 1904), these including the excise on alcohol, the monopoly of the purchase and sale of salt, and the monopoly of the purchase, manufacture and sale of opium.

The chief items of expenditure in 1904 were the following:—

Public Works	£385,680
Customs and "régies"	618,654
Naval and Military Services	527,663
Loans[2]	417,421

Shipping.—The following table shows the total tonnage of shipping entered and cleared at the ports of French Indo-China in 1905 and its distribution over the countries of the Union:—

Country.	Tonnage.	
	Entered.	Cleared.
Cochin-China	1,117,054	1,007,510
Tongking	242,119	348,947
Annam	28,065	26,406
Cambodia	2,520	2,012
Total	1,389,758	1,384,875

Over half the tonnage was French (698,178 tons entered); the

[1] This does not apply to the budget of Cochin-China, which is voted by the colonial council and approved by the governor-general alone.

[2] This does not include the expenditure on account of the 3% loan of £8,000,000, which is inscribed in a special account. The debt of the government-general of Indo-China is composed as follows:—

	Nominal Capital.	Nominal Capital in circulation on Jan. 1, 1907.
2½% Loan of 1896 (Annam-Tongking)	£3,678,000	£3,342,800
3½% Loan of £8,000,000 issued from 1899 to 1905	8,748,260	8,640,060
Total	£12,426,260	£11,982,860

United Kingdom came second (284,277 tons); Germany, third (205,615 tons).

Commerce.—The value of the trade of French Indo-China increased from £6,796,000 in 1896 to £16,933,000 in 1905, its average annual value for the years 1896–1905 being £12,213,000.

The following table shows the movement of commerce in 1905:

	Imports.	Exports.	Total.
	£	£	£
France	4,314,586	1,233,295	5,547,881
French colonies . .	163,568	76,855	240,423
Foreign countries .	5,704,257	5,440,156	11,144,413
Total. . . .	10,182,411	6,750,306	16,932,717

In 1905 the principal foreign countries from which goods were imported were:

Hong Kong	for	£2,473,882[1]
Singapore	,,	598,449
China and Japan.	,,	1,473,704
Burma and Siam	,,	289,542
The British Isles	,,	141,381
The United States	,,	126,425

The principal countries to which goods were exported were:

Hong Kong	for	£1,706,597[1]
China and Japan	,,	497,288
Singapore	,,	360,510
Burma and Siam	,,	80,071
The British Isles	,,	55,539

The principal imports were:

Wheat	for	£214,156
Rice	,,	226,755
Raw opium	,,	271,582
Raw cotton	,,	167,020
Wine	,,	340,027
Pit coal	,,	206,221
Petroleum	,,	388,163
Gold	,,	203,369
Iron and steel	,,	353,214
Tin	,,	526,428
Cotton thread	,,	672,040
Jute tissues	,,	254,255
Cotton tissues	,,	922,250
Silk tissues	,,	241,113
Paper	,,	344,633
Metal-work	,,	1,170,576
Arms, powder and ammunition.	,,	170,882

The principal exports were:

Dried fish, salt and smoked .	for	£151,415
Rice	,,	2,848,389
Pepper	,,	214,297
Pit coal	,,	182,077
Tin	,,	553,914
Cotton thread	,,	421,162

The customs tariff is substantially the same as that of France, severe import duties being levied on foreign goods. French goods pay no import duty and goods exported thither are exempt from export duty, with the exception of sugar, which is regulated by special legislation, and of various other colonial products (*e.g.* coffee, cocoa, tea, vanilla, pepper) which pay half the duty applicable to similar foreign products according to the minimum tariff. Goods from French colonies pay no import duty. About 53% of the imports, comprising nearly all manufactured goods of European origin, come from France. China, Japan and Singapore are the other chief sources of imports. The Bank of Indo-China (capital £1,440,000) besides receiving deposits and discounting bills, issues bank-notes and has, till 1920, the privilege of lending money on security.

Communications.—The railway communications of French Indo-China comprise lines from Hai-Phong to Lao-Kay, continued thence via the Nam-Te valley to Yun-nan; from Hanoi northward to Lang-Son and south to Vinh; from Tourane to Kwang-Tri via Hué and from Kan-Tho (Cochin-China) to Khanh-Hoa (Annam) via My-Tho, Saigon, Bien-Hoa and Jiring with branches to Phan-Tiet and Phan-Rang. The three last are the completed sections of a line which will unite Tongking with Cochin-China. The towns in the deltas of the Mekong and Red river are united by a network of canals. The mandarin road following the coast line of Annam connects Tongking with Cochin-China, but the easiest means of communication between these two territories is by sea, the voyage from Saigon to Tourane lasting three days, that from Tourane to Hai-Phong, thirty hours.

History—The beginning of French influence in Indo-China dates from 1787, when a treaty was concluded between Gia-long, king of Annam (*q.v.*), and the king of France, whereby Tourane and the island of Pulo-Condore were ceded to the latter. The successors of Gia-long were averse from French influence and instituted persecutions of the Christian missionaries and natives, which led, in the reign of Tu-duc in 1858, to the arrival at Tourane of a French and Spanish fleet. The capture of that town was followed early in 1859 by the storming of Saigon, which Rigault de Genouilly, the French admiral, chose as his base of operations. The French and Spanish were, however, too few to take the offensive, and were forced to submit to a blockade, conducted by the Annamese general Nguyen Tri Phuong, at the head of 20,000 troops. It was not till February 1861 that reinforcements under Admiral Charner reached Saigon, and the Annamese were defeated and My-Tho taken. A revolt against Tu-duc in Tongking, and the stoppage of the rice supplies from Cochin-China, obliged the king to submit, in 1862, to a treaty by which three provinces of Cochin-China were ceded and other concessions accorded to France. However, it was only after further military operations that Tu-duc consented to the ratification of the treaty. In 1863 Admiral de la Grandière was appointed governor of Cochin-China and in the same year France established her protectorate over Cambodia. It was under La Grandière that the exploration of Mekong was undertaken (see GARNIER, M J. F.) and that in 1867 the three provinces of Cochin-China left to Annam were annexed. French intervention in Tongking, which began with the expedition of François Garnier to Hanoi in 1873, culminated after a costly and tedious war (see TONGKING) in the treaties of 1883 and 1884, whereby Annam and Tongking passed under the protectorate of France. The latter treaty, though its provisions were subsequently much modified, remains theoretically the basis of the present administration of Annam.

From 1884 onwards the history of Indo-China may be divided into two distinct periods, characteristic of the political conception and governmental system adopted by the French government. In the first period, 1884–1891, the French agents in Tongking and Indo-China generally proceeded under cover of the treaty of 1884 with the definite conquest and annexation of Tongking and also Annam. Cochin-China itself openly designed to seize the southern provinces of Annam, upon the borders of which it lay. This policy, momentarily checked by the war with China, was vigorously, even violently, resumed after the treaty of Tientsin (June 1885). The citadel of Hué was occupied in July 1885 by General de Courcy. The Annamese government forthwith decided upon rebellion. An improvised attack upon the French troops was led by the ministers Thu-yĕt and Thu-ong. The revolt was promptly suppressed. The regent Thu-yĕt and the king Ham-N'ghi (crowned in August 1884) fled. At this time the French government, following a very widespread error, regarded Tongking and Annam as two distinct countries, inhabited by populations hostile to each other, and considered the Tongkingese as the oppressed vassals of the Annamese conqueror. To conquer Annam, it was said, would liberate Tongking. This misconception produced the worst consequences. With the flight of the king civil war commenced in Annam. The people of Tongking, whose submission the court of Hué had not dared to demand, began to rise. Taking advantage of this state of anarchy, pirates of the Black Flag, Chinese deserters and Tongkingese rebels devastated the country. The occupation of Tongking became a prolonged warfare, in which 25,000 French, compelled to guard innumerable posts, had to oppose an intangible enemy, appearing by night, vanishing by day, and practising brigandage rather than war. The military expenditure, met neither by commerce, which had become impossible, nor taxation, which the Annamese could not pay nor the French receive, resulted in heavy deficits. The resident-general, Paul Bert, who hoped to gain the confidence of the mandarins by kindness and goodwill, did not succeed in preventing, or even moderating, the action of the military régime. Than-quan, Hon-Koi, Lao-Kay, Pak-Lun and Kao-Bang were occupied, but the troops were driven back to the delta and almost invested in the towns. Disappointed in his hopes and worn out

[1] The transit trade between Hong Kong and Yun-nan via Tongking is of considerable importance (see TONGKING).

rather by anxiety than work, Paul Bert succumbed to his troubles in November 1886, seven months after his arrival in the country. His successors possessed neither the strength nor the insight necessary to grapple with the situation. M. Constans, however, appointed "provisional" governor-general after the death of M. Filippini, succeeded to a certain extent in reviving commerce in the towns of the delta. MM. Richaud, Bihourd and Piquet, successors of M. Constans, were all powerless to deal with the uninterrupted "bush-fighting" and the augmentation of the deficit, for no sooner was the latter covered by grants from the mother country than it began to grow again. At the close of the financial year in 1890 France had paid 13,000,000 francs. In April 1891 the deficit again approached the sum of 12,000,000 francs. The rebels held almost all the delta provinces, their capitals excepted, and from Hanoi itself the governor-general could see the smoke of burning villages at the very gates of his capital.

At this point a complete change of policy took place. M. de Lanessan, a Paris deputy sent on a mission in the course of 1887, made himself acquainted with the government and the court of Hué. He recognized the absolute falsity of the story which represented the Tongkingese as the oppressed subjects of the Annamese. He demonstrated the consanguinity of the populations, and after intercourse with the regents, or ministers, of Hué he realized that the pacification of the country depended upon harmonious relations being established between the general government and the court. Appointed governor-general with the fullest powers on the 21st of April 1891, he presented himself at Hué, concluded with the *comat* an agreement based on the principle of a "loyal protectorate," and reassured the court, up to this point uneasy under menace of annexation. The *comat* shortly issued a proclamation under the great royal seal, never hitherto attached to any of the public acts imposed upon the king by the governors, who had been unaware of its existence. In this proclamation the king ordered all his subjects to obey the governor-general and to respect him, and commanded rebels to lay down arms. The effect was immediate—disorders in the delta ceased. The pirates alone, in revolt against the king of Annam and all authority, continued their brigandage. But the governor-general instituted four "military districts," the commanders of which were commissioned to destroy the pirates. At the same time he placed a force of native police, the *linh co*, at the disposal of the mandarins, hitherto regarded with suspicion and intentionally deprived of all means of action. Order was restored within the delta. In the mountainous districts infested by pirates roads were opened and posts established. The chief haunts of the pirates were demolished, and during 1893 the foremost pirate chiefs gave in their submission. The Indo-Chinese budget regained its balance. On the Chinese frontier agreements were concluded with Marshal Sou, in command of the Chinese forces, regarding the simultaneous repression of piracy in both countries. But on the Mekong difficulties arose with the Siamese. For centuries Siam had occupied the right bank of the Mekong, and her troops had crossed the river and occupied the left bank. Luang-Prabang was in the hands of the Siamese, who had also established posts at Stung-treng and elsewhere. Friction occurred between the French agents and Siamese soldiery. After the death of Inspector Crosgurin on the 5th of June 1893 the French government occupied Stung-treng and Khong. France demanded explanations and redress at Bangkok, but the court refusing concessions, an ultimatum was presented to the king by M. Pavie, French minister to Siam. The terms of the ultimatum not having been complied with within the given time, the French flotilla, consisting of the gunboats "L'Inconstant" and "La Comète," crossed the bar of the Menam on 13th July 1893, forced the entrance of the channel, and anchored at Bangkok, before the French legation. A second ultimatum was then presented. It contained the following conditions:—First, the occupation of Chantabun by the French until the Siamese should have entirely evacuated the left bank of the Mekong; secondly, the Siamese to be interdicted from maintaining military forces at Battambang, Siem-Reap, and generally from establishing fortified positions within $15\frac{1}{2}$ m. of the right bank of the Mekong; thirdly, Siam to be interdicted from having armed boats on the great lake Tonle-Sap. This agreement was executed immediately, the Laotians being eager parties to it. On the 29th of September 1893 the king of Luang-Prabang made his submission to the French government, and besought it to use its influence with the court of Siam for the return to their families of the sons of princes and mandarins then in schools at Bangkok. The Siamese evacuated the left bank of the Mekong, and France took possession of Laos, a treaty, on the basis of the ultimatum, being signed on the 1st of October 1893. The disputes to which this affair with Siam had given rise between France and Great Britain were amicably settled by an agreement concluded on the 15th of January 1896. This "declaration," virtually ratifying the treaty concluded in 1893 between France and Siam, settled the limits of the zones of influence of the two contracting powers in the north of the Mekong regions and on the frontiers of Siam and Burma. Great Britain resigned to France the regions of the Muong-Sing which she had previously occupied. The great part of Siam included in the Menam basin was declared neutral, so also the Me-ping basin in the north, Meklong Pechaburi and Bang Pa Kong rivers in the south. The neutral zone, $15\frac{1}{2}$ m. wide on the right bank of the Mekong, was formally recognized.

In 1904, by a new Franco-Siamese treaty setting aside that of 1893, Chantabun was evacuated and the neutral zone renounced in return for the cession of the provinces of Bassac and Melupré and the district of Dansai (comprising the portion of Luang Prabang on the right bank of the Mekong) and the maritime district of Krat. By a further convention in 1907 Siam ceded the provinces of Battambang, Siem-Reap and Sisophon, and received in return the maritime province of Krat and the district of Dansai ceded in 1904. At the same time France abandoned all designs on territory of Siam by giving up certain areas obtained for the purposes of railway building on the right bank of the Mekong.

After the recall of M. de Lanessan in 1894 (see above), and before his successor, M. Rousseau, was able to acquaint himself fully with the condition of the country, military expeditions began again and the deficit soon reappeared. Tranquillity, however, being restored, attention was given to public works. On the 12th of October 1895 M. Rousseau left to ask parliament to vote a loan of 100,000,000 francs. On the 10th of February 1896 a law was passed authorizing a loan of 80,000,000 francs, and on the 14th of March 1896 an office for the financial control of the government-general of Indo-China was established. In the interval a French company had obtained from China a concession to prolong the railway from Langson to Lungchow on a tributary of the Canton river. M. Rousseau, who died on the 10th of December 1896, was replaced by M. Doumer, previously minister of finance, under whose government was realized, as has been before stated, the union of Indo-China. On the 20th of December 1898 M. Doumer obtained from parliament authorization to contract a loan of 200,000,000 francs, the proceeds of which were appropriated to the construction of railway lines.

INDO-EUROPEAN LANGUAGES. The Indo-European (I.E.) languages are a family of kindred dialects spread over a large part of Europe, and of Asia as far as India.

The main branches so far identified fall easily into two groups of four. These groups are distinguished from one another by the treatment of certain original guttural sounds, *k(c)*, *g*, *kh*, *gh*, which one group shows as consonants, while the other converts them into sibilants. The variation is well shown in the word for "hundred": Gr. ἑ-κατόν, Lat. *centum*, Old Irish *cēt*; Sanskrit *śatam*, Zend *satəm*, Lithuanian *szimtas*, Old Bulgarian (Old ecclesiastical Slavonic) *sŭto*. In the first three the consonant is a hard guttural (the Romans said *kentum*, not *sentum*), in the others it is a sibilant (the Lithuanian *sz* is the English *sh*).

The first group (generally known as the *centum*-group) is the Western and entirely European group, the second (generally known as the *satem*-group) with one exception lies to the east of the *centum*-group and much its largest part is situated in Asia. To the *centum*-group belong (1) Greek; (2) the Italic languages, including Latin, Oscan, Umbrian and various minor dialects of ancient Italy; (3) Celtic, including (*a*) the Q-Celtic languages, Irish, Manx and Scotch Gaelic, (*b*) the P-Celtic, including the language of ancient Gaul, Welsh, Cornish and Breton: the differentiation, which exists also in the Italic languages, turning upon the treatment of original *kw* sounds, which all the Italic languages save Latin and the little-known Faliscan and the (*b*) group of the Celtic languages change to *p*. With these go (4) the Germanic or Teutonic languages, including (*a*) Gothic, (*b*) the Scandinavian languages, Swedish, Danish, Norwegian, Icelandic—differentiated in historical times out of a single language, Old Norse,—(*c*) West Germanic, including English and Frisian, Low Frankish (from which spring modern Dutch and Flemish), Low and High German.

To the *satem*-group belongs (1) Aryan or Indo-Iranian, including (*a*) Sanskrit, with its descendants, (*b*) Zend, and (*c*) Old Persian, from which is ultimately descended Modern Persian, largely modified, however, by Arabic words. This group is often divided into two sub-groups, *Indo-Aryan*, including the languages of India, and *Iranian*, used as a general title for Zend and Old Persian as the languages of ancient Iran. Although the sounds of Indo-Aryan and Iranian differ considerably, phrases of the earliest form of the one can be transliterated into the other without change in vocabulary or syntax. (2) To the west of these lies Armenian, which is so full of borrowed Iranian words that only in 1875 was it successfully differentiated by Hübschmann as an independent language. It is probably related to, or the descendant of, the ancient Phrygian, which spread into Asia from Thrace by the migration of tribes across the Hellespont. Of ancient Thracian unfortunately we know very little. (3) North of the Black Sea, and widening its borders in all directions, comes the great Balto-Slavonic group. In this there are two branches somewhat resembling the division between Indo-Aryan and Iranian. Here three small dialects on the south-east coast of the Baltic form the first group, Lithuanian, Lettish and Old Prussian, the last being extinct since the 17th century. The Slavonic languages proper themselves fall into two groups: (*a*) an Eastern and Southern group, including Old Bulgarian, the ecclesiastical language first known from the latter part of the 9th century A.D.; Russian in its varieties of Great Russian, White Russian and Little Russian or Ruthenian; and Servian and Slovene, which extend to the Adriatic. (*b*) The western group includes Polish with minor dialects, Czech or Bohemian, also with minor languages in the group, and Sorb. In the *satem* division is also included (4) Albanian, which like Armenian is much mixed with foreign elements—Latin, Greek, Turkish and Slavonic. The relation between it and the ancient Illyrian is not clear.

Besides the languages mentioned there are many others now extinct or of which little is known—*e.g.* Venetic, found in clearly written inscriptions with a distinctive alphabet in north-eastern Italy; Messapian, in the heel of Italy, which is supposed to have been connected with the ancient Illyrian; and possibly also the unknown tongue which has been found recently on several inscriptions in Crete and seems to have been the language of the pre-Hellenic population, the finds apparently confirming the statement of Herodotus (vii. 170) that the earlier population survived in later times only at Praesos and Polichne. Names of deities worshipped by the Aryan branch are reported to have been discovered in the German excavations at Boghaz-Keui (anc. *Pteria, q.v.*) in Cappadocia; names of kings appear in widely separated areas elsewhere in Asia,[1] and a language not hitherto known has recently been found in excavations in Turkestan and christened by its first investigators Tocharish.[2] So far as yet ascertained, Tocharish seems to be a mongrel dialect produced by an intermixture of peoples speaking respectively an I.E. language and a language of an entirely different origin. The stems of the words are clearly in many cases I.E., but the terminations are no less clearly alien to this family of languages. It is remarkable that some of its words, like *ku*, "dog," have a hard *k*, while the other languages of this stock in Asia, so far as at present known, belong to the *satem*-group, and have in such words replaced the *k* by a sibilant.

Till the latter part of the 18th century it was the universal practice to refer all languages ultimately to a Hebrew origin, because Hebrew, being the language of the Bible, was assumed, with reference to the early chapters of Genesis, to be the original language. Even on these premises the argument was unsound, for the same authority also recorded a confusion of tongues at Babel, so that it was unreasonable to expect that languages thus violently metamorphosed could be referred so easily at a later period to the same original. The first person to indicate very briefly the existence of the Indo-European family, though he gave it no distinctive name, was Sir William Jones in his address to the Bengal Oriental Society in 1786. Being a skilled linguist, he recognized that Sanskrit must be of the same origin as Greek, Latin, Teutonic (Germanic) and possibly Celtic (*Asiatic Researches*, i. p. 422; *Works* of Sir W. Jones, i. p. 26, London, 1799). Unfortunately Sir William Jones's views as to the relationship of the languages were not adopted for many years by later investigators. He had said quite definitely, "No philologer could examine them all three (Sanskrit, Greek and Latin) without believing them to have sprung from some common source, which perhaps no longer exists." Friedrich Schlegel, who learnt Sanskrit from Alexander Hamilton in Paris nearly twenty years later, started the view that Sanskrit, instead of being the sister, was the mother of the other languages, a mistake which, though long since refuted in all philological works, has been most persistent.

Curiously enough the history of the names given to the family is obscure. The earliest known occurrence of the word "Indo-European" is in an article in the *Quarterly Review* for 1813[3] by Dr Thomas Young. The term has been in use in English and in French almost continuously since that date. But a glance at Dr Young's article will show that he included under Indo-European many languages like Basque, Etruscan and Arabian (his term for Semitic), which certainly do not belong to this family of languages at all; and if the term is taken to mean, as it would seem to imply, all the languages spoken in India and Europe, it is undoubtedly a misnomer. There are many languages in India, as those of the Dravidians in Southern India and those of Northern Assam, which do not belong to this family. On the other hand there are many languages belonging to the family which exist outside both India and Europe—Zend, Old Persian, Armenian, Phrygian, to say nothing of languages recently discovered. The term most commonly used in Germany is "Indo-Germanic." This was employed by Klaproth as early as 1823. It is said not to have been invented by him, but by whom and

[2] Sieg und Siegling, "Tocharisch, die Sprache der Indoskythen" (*Sitzb. d. Berl. Ak.* 1908, pp. 915 ff.).

[3] No. xix. p. 255, "Another ancient and extensive class of languages, united by a greater number of resemblances than can well be altogether accidental, may be denominated the Indo-European, comprehending the Indian, the West Asiatic, and almost all the European languages."

when it was invented is not quite ascertained.[1] It is an attempt to name the family by its most easterly and most westerly links. At the time when it was invented it had not yet been settled whether Celtic was or was not a member of this family. But in any case the term would not have been wrong, for members of the Germanic stock have been settled for above a thousand years in Iceland, the most westerly land of Europe, and for the last four centuries have increasingly dominated the continent of America. As has been pointed out by Professor Buck of Chicago (*Classical Review*, xviii. p. 400), owing to the German method of pronouncing *eu* as *oi*, the word "Indo-Germanic" is easier for a German to pronounce than "Indo-European." Attempts to discover a more accurate and less ponderous term, such as "Indo-Celtic" or "Celtindic," have not met with popular favour. Aryan (*q.v.*) is conveniently brief, but is wanted as the proper term for the most easterly branch of the family. What is wanted is a term which does not confuse ethnological and linguistic ideas. Not all speakers of any given language are necessarily of the same stock. In ancient Rome Latin must have been spoken by many slaves or sons of slaves who had no Latin blood in their bodies, though a slave if manumitted by his master might be the father or grandfather of a Roman citizen with full rights. Plautus and Terence were both aliens, the one an Umbrian, the other an African. The speakers of modern English are even a more multifarious body. A possible name for the family, implying only the speaking of a language of the stock without any reference to racial or national characteristics, could be obtained from the name for man, so widely though perhaps not altogether universally diffused throughout the family—Sanskrit *vīras*, Lithuanian *wyras*, Lat. *vir*, Irish *fer*, Gothic *waír*, &c. If the speakers of these languages were called collectively *Wiros*, no confusion with ethnological theories need arise.

It is customary to talk of the roots, stems and suffixes of words in the Indo-European languages. These languages are distinguished from languages like Chinese by the fact that in the great majority of words suffixes can be separated from roots. But the distinction between them and the so-called agglutinative languages is one of degree rather than of kind. In the agglutinative languages, or at any rate in some of them, some of the post-fixed elements have still an independent value. In the Indo-Germanic languages no one can say what the meaning of the earliest suffixes was. Suffixes which have developed in individual languages or individual sections of this family of languages can often be traced, *e.g.* the often quoted *-hood* in English words like "manhood," or the English *-ly* in "manly," which has gradually extended till it is actually attached to its own parent *like* in "likely." But all recent investigation goes to show that before the Indo-European languages separated they possessed words with all the characteristics which we recognize in substantives like the Latin *dominus* or verbs like the Greek δείκνυται. Or, to put the same fact in another way, by the comparative method it is impossible to reach a period when the speakers of Indo-European languages spoke in roots. A "root" is only a convenient philological abstraction; it is merely the remnant which is left when all the elements that can be analysed are taken away; it is therefore only a kind of greatest common measure for a greater or smaller body of words expressing modifications of the same idea. Thus, though by no means the earliest form of the word, the English *man* might be taken as the "root" from which are derived by various suffixes *manhood, manly, mannish, manful, manned* (past tense), *manned* (participle), *unman, mannikin*, &c. How far the suffixes which can be traced back to Indo-European times (*i.e.* to a time before the separation of the languages) had existence as separate entities it is impossible to say. From what we see of the later history of the languages it is much more probable that both forms and signification were very largely the result of analogy. For in the making of new words analogy plays a much larger part than any reference to general principles of formation or composition. New words are to a large extent, even in modern times, the invention of persons unskilled in the history of language.

The first to point out that the term Indo-European (or Indo-Germanic) was not used uniformly in one sense was Professor Kretschmer in his *Einleitung in die Geschichte der griechischen Sprache* (Göttingen, 1896), pp. 9 ff. It is in fact used in three senses. (1) Indo-European is treated as preceding and different from all its descendants, a single uniform speech without dialects. But, strictly, no such language can exist, for even individual members of the same family differ from one another in pronunciation, vocabulary, sentence formation, etc. Thus it appears impossible to ascertain what the Indo-European term for the numeral 1 was, since different languages show at least four words for this, three of them presenting the same root with different suffixes: (*a*) Sanskrit *eka* (= *οι–quo–); (*b*) Zend *aeva*, Old Persian *aiva*, Greek οἶ-(ϝ)ο-ς (= *οι–u̯o–); (*c*) Greek οἰνή, "ace," Latin *unus* (older *oenus*), Old Irish *oen*, Gothic *ains*, Lithuanian *vénas* (where the initial *v* has no more etymological signification than the *w* which now begins the pronunciation of the English *one*), Old Bulgarian *inŭ*; (*d*) Greek εἷς, ἕν (= **sem–s*). But the Indo-European community must have had a word for the numeral since the various languages agree in forms for the numerals 2 to 10, and the original Indo-European people seem to have been able to count at least as far as 100. On the other hand, if the Indo-European language must have had dialects, the line of differentiation between it and its descendants becomes obliterated. (2) But even when a word is found very widely diffused over the area of the Indo-European languages, it is not justifiable to conclude that therefore the word must have belonged to the original language. The dispersion of the Indo-European people over the areas they now inhabit, or inhabited in the earliest times known to history, must have been gradual, and commerce or communication between different branches must have always existed to some extent; the word might thus have been transmitted from one community to another. When a word is found in two branches which are geographically remote from one another and is not found in the intermediate area, the probability that the word is original is somewhat stronger. But even in this case the originality of the word is by no means certain, for (*a*) the intervening branch or branches which do not possess the word may merely have dropped it and replaced it by another; (*b*) the geographical position which the branches occupy in historical times may not be their original position; the branches which do not possess the word may have forced themselves into the area they now occupy after they had dropped the word; (*c*) if the linguistic communities which possess the word have a seaboard and the intervening communities have not, the possibility of its transmission in connexion with early sea-borne commerce must be considered. At the dawn of European history the Phoenicians and the Etruscans are great seafarers; at a later time the Varangians of the North penetrated to the Mediterranean and as far as Constantinople; in modern times sea-borne commerce brought to Europe words from the Caribbean Indians like *potato* and *tobacco*, and gave English a new word for man-eating savages—*cannibal*. Thus with Kretschmer we must distinguish between what is common Indo-European and what is original Indo-European in language. (3) A word may exist in several of the languages, and may have existed in them for a very long time, and yet not be Indo-European. Hehn (*Das Salz*, ed. 2, 1901) rejects *salt* as an Indo-European word because it is not found in the Aryan group, though in this case he is probably wrong, (*a*) because, as has been shown by Professor Johannes Schmidt, its irregular declension (*sal-d*, genitive *sal-nes*) possesses characteristics of the oldest Indo-European words; (*b*) because the great plains of Iran are characterized by their great saltness, so that the Aryan branch did not pass through a country where salt was unknown, although, according to Herodotus (i. 133), the Persian did not use salt to season his food. Since Kretschmer wrote, this argument has been used very extensively by Professor A. Meillet of Paris in his *Dialectes indo-européens* (Paris, 1908). In this treatise he brings forward arguments from a great variety of facts to show that in the original Indo-European language there were dialects, the Aryan, Armenian, Balto-Slavonic and Albanian, as we have seen, forming an oriental group with novel characteristics developed in common, although in various other characteristics they do not agree. Similarly Italic, Celtic and Germanic form a Western group, while Greek agrees now with the one group now with the other, at some points being more intimately connected with Italic than with any other branch, at others inclining more towards the Aryan. This grouping, however, is by no means exclusive, members of either group having characteristics in common with individuals of the other group which they do not share with the other languages of their own group (Meillet, p. 131 ff.).

From all this it is clear that in many cases it must be extremely uncertain what is original Indo-European and what is not. Some general characteristics can, however, be predicated from what is handed down to us in the earliest forms of all or nearly all the existing languages. (1) The noun had certainly a large number of distinct cases in the singular: nominative, accusative, genitive, ablative, locative, instrumental, dative.[1] In the plural, however, there was less variety, the forms for dative and ablative being from the earliest times identical. In the dual, the oblique cases cannot be restored with certainty, so little agreement is there between the languages. In the locative-singular the ending *–i* seems to have been of the nature of a post-position, because in various languages (notably in Sanskrit) forms appear without any suffix. In the locative plural also the difference between the *–su* of Sanskrit and early Lithuanian (Slavonic *–chu*) on the one hand, and of *–σι* in Greek on the other,

[1] Leo Meyer, "Über den Ursprung der Namen Indogermanen, Semiten und Ugrofinner," in the *Göttinger gelehrte Nachrichten, philologisch-historische Klasse*, 1901, pp. 454 ff.

[1] The vocative is not strictly speaking a case at all, for it stands outside the syntax of the sentence. It was originally an exclamatory form consisting of the bare stem without case suffix. In the plural the nominative is used to supply the lacking vocative form.

seems to be best explained by supposing that the *-u* and *-i* are postpositions, a conclusion which is strengthened by the Greek rule that *-σ-* between vowels disappears. In the instrumental singular and plural it is noticeable that there are two suffixes—one, represented in Germanic and Balto-Slavonic only, beginning with the sound *-m*, the other, surviving in most of the other languages for the plural, going back to an Indo-European form beginning with *-bh*. Professor Hirt of Leipzig has argued (*Idg. Forschungen*, v. pp. 251 ff.) that *-bh-* originally belonged to the instrumental plural (cf. the Lat. *filiabus, omnibus*, &c.), and the forms with *-m-* to the dative and ablative. But this is merely a conjecture, which has no linguistic facts in its favour, for the *-bi* of the Latin dative *tibi*, which has parallel forms in many other languages, belongs to the pronouns, which show in their declension many differences from the declension of the noun (cf. also Brugmann, *Grundriss* (ed. 2), ii. 2, p. 120). (2) The adjective agrees with its noun in gender, number and case, thus introducing a superfluous element of agreement which is not found, *e.g.* in most of the agglutinative languages. Thus in phrases like the Greek ἡ καλὴ κόρη or the Latin *illa pulchra puella* the feminine gender is expressed three times, with no advantage, so far as can be detected, over the modern English, *that fair maid*, where it is not obviously expressed at all. In this respect and also in the employment of the same case endings for the plural as well as the singular, in the plural after a syllable expressing plurality, the agglutinative languages have a distinct superiority over the Indo-European languages in their earliest forms. Some languages, like English and Modern Persian, have practically got rid of inflexion altogether and the present difficulty with it; others, like modern German, as the result of phonetic and analogical changes have even intensified the difficulty. (3) In the personal pronouns, especially those of the first and second persons, there is widely spread agreement, but more in the singular than in the plural. Forms corresponding to the English *I* and *thou*, the Latin *ego* and *tu*, are practically universal. On the other hand the demonstrative pronouns vary very considerably. (4) The system of numerals (subject to slight discrepancies, as that regarding 1 mentioned above) is the same, at least up to 100. (5) In the verb there were at first two voices, the active and the middle, and three moods, the indicative, the subjunctive and the optative. It has been suggested by Professors Oertel and Morris in *Harvard Studies*, xvi. (p. 101, n. 3) that the similarity which exists between the earliest Greek and the earliest Aryan in the moods is the result of a longer common life between those two branches. But of this there is no proof, and the great difference in the treatment of the sounds by these two branches (see below) militates very strongly against the supposition. The tense forms indicated originally not relations in time but different kinds of action. The distinctive forms are the present, the perfect, and the aorist. The present indicated that an action was in progress or continuous, the aorist on the other hand regarded the action as a whole and, as it were, summed it up. The aorist has sometimes been said to express instantaneous action, and so it does. But this is not the essence of the aorist; the aorist may be used also of a long continued action when it is regarded as a whole. Greek shows this very clearly. In Athenian official inscriptions it was usual to fix the date of the record by stating at the commencement who was the chief magistrate (archon) of the year. This was expressed by the imperfect (ἦρχε). But when reference was made to a past archonship, that was expressed by the aorist (ἦρξε). The same characteristic is evident also in prohibitions; thus, in Plato's *Apology of Socrates*, μὴ θορυβήσητε is "Do not begin to make a disturbance," μὴ θορυβεῖτε is "Do not keep on making a disturbance." These points are most easily illustrated from Greek, because Greek, better than the other languages, has kept the distinctive usages of both moods and tenses. The perfect as distinguished from the other forms expresses either repetition of the action, emphasis, or the state which results from the action expressed by the verb. Different languages regard this last in different ways. Sometimes the state resulting from the action is so characteristic that the perfect is almost an independent verb. Thus in Greek κτάομαι is "I acquire," but κέκτημαι (the perfect) is "I possess," the result of the action of acquiring. On the other hand the perfect may mean that the action has come to an end. This is specially common in Latin, as in Cicero's famous announcement of the execution of the Catilinarian conspirators,—*Vixerunt* ("They have lived" = "They are no more"). But it is by no means confined to Latin. The pluperfect, the past of the perfect, is a late development and can hardly be reckoned Indo-European. In Greek the forms clearly arise from adding aorist endings to a perfect stem. The forms of Latin are not yet completely explained—but it is certain that the specially Latin meaning expressing something that was past at a time already past (relative time) is a late growth. When Homeric Greek wishes to express this meaning it uses most frequently the aorist, but also the imperfect as well as the pluperfect, the notion of relative time being derived from the context. In the earliest Latin the pluperfect is not uncommonly used with the value of the aorist perfect. As regards the future it is difficult to say how far it was an original form. Some languages, like Germanic, preserve no original form for the future. When the present is found not to be distinctive enough, periphrastic forms come in. In other languages, like Latin and Greek, there is constant confusion between subjunctive and future forms. It is impossible to distinguish by their form between δείξω (future) and δείξω (subjunctive), between *regam* (future) and *regam* (subjunctive). A special future with a suffix *-sio-* (*syo*) is found only with certainty in the Aryan group and the Baltic languages. The future perfect is, strictly speaking, only a future made from a perfect stem; in the Latin sense it is certainly a late development, and even in early Latin, *videro* has occasionally no different meaning from *videbo*. The imperative, which was originally an exclamatory form to the verb, of the same kind as the vocative was to the noun, and which consisted simply of the verb stem without further suffixes, developed, partly on the analogy of the present and partly with the help of adverbs, a complete paradigm. The infinitives of all the languages are noun cases, generally stereotyped in form and no longer in touch with a noun system, though this, *e.g.* in early Sanskrit, is not always true. The participles differ only from other adjectives in governing the same case as their verb; and this is not an early distinction, for in the earliest Sanskrit all verbal nouns may govern the same case as their verb.

The system here sketched in the barest outline tended steadily to fall into decay. The case system was not extensive enough to express even the commonest relations. Thus there was no means of distinguishing by the cases between starting from outside and starting from inside, ideas which, *e.g.* Finnish regards as requiring separate cases; without a preposition it was impossible to distinguish between *on* and *in*, though to the person concerned there is much difference, for example between being on a river and in a river. There are other difficulties of the same kind. These had to be got over by the use of adverbs. But no sooner had the adverbs become well established for the purpose of defining these local relations than the meaning was felt to exist more in the adverb than in the case ending. For this syntactical reason, as well as for mechanical reasons arising from accent (*q.v.*), the case system in some languages fell more and more into desuetude. In Sanskrit it has been kept entire, in Balto-Slavonic the only loss has been the disappearance of the original genitive and its replacement by the ablative. In Latin the locative has been confused with the genitive and the ablative, and the instrumental with the ablative. The loss of the locative as an independent case had not long preceded historical times, because it survives in Oscan, the kindred dialect of the neighbouring Campania. Greek has confused ablative with genitive, except for one small relic recently discovered on an inscription at Delphi; in the consonant stems it has replaced the dative by the locative form and confused in it dative, locative and instrumental meanings. In some other members of the family, *e.g.* Germanic, the confusion has gone still farther.

The fate of the verb is similar, though the two paradigms do not necessarily decay at the same rate. Thus Latin has modified its verb system much more than its noun system, and Greek, while reducing seriously its noun forms, shows a very elaborate verb system, which has no parallel except in the Aryan group. From the syntactical point of view, however, the Greek system is much superior to the Aryan, which has converted its perfect into a past tense in classical Sanskrit, and to a large extent lost grip of the moods. The decay in Aryan may be largely attributed to the power, which this group developed beyond any other, of making compounds which in practice took the place of subordinate sentences to a large extent. The causes for the modifications which the Latin verb system has undergone are more obscure, but they are shared not only by its immediate neighbours the other Italic dialects, but also to a great degree by the more remote Celtic dialects.

The origin and spread of the Indo-European languages has long been, and remains, a vexed question. No sooner had Bopp laid the foundation of Comparative Philology in his great work, the first edition of which appeared in 1833–1835, than this question began to be seriously considered. The earlier writers agreed in regarding Asia as the original home of the speakers of these languages. For this belief there were various grounds, —statements in the Biblical record, the greater originality (according to Schlegel) of Sanskrit, the absurd belief that the migrations of mankind always proceeded towards the west. The view propounded by an English philologist, Dr R. G. Latham, that the original home was in Europe, was scouted by one of the most eminent writers on the subject—Victor Hehn—as lunacy possible only to one who lived in a country of cranks. Latham's view was first put forward in 1851, and in half a century opinion had almost universally come over to his side. Max Müller indeed to the last held to the view that the home was "somewhere in Asia," and Professor Johannes Schmidt of Berlin, in a paper read before the Oriental Congress at Stockholm in 1889, argued for a close contact between early Indo-European and Assyrian civilization, from the borrowing of one or two words and the existence of duodecimal elements in the Indo-European numeral system side by side with the prevalent decimal system—the dozen, the gross, the long hundred (120), &c.

At 60 the systems crossed, and 60 was a very characteristic element in Assyrian numeration, whence come our minutes and seconds and many other units.[1]

Even before Latham a Belgian geologist, d'Omalius d'Halloy, in 1848 had raised objections to the theory of the Asiatic origin of the Indo-Europeans, but his views remained unheeded. In 1864 he brought three questions before the *Société d'anthropologie* of Paris: (1) What are the proofs of the Asiatic origin of Europeans? (2) Have not inflectional languages passed from Europe to Asia rather than from Asia to Europe? (3) Are not the speakers of Celtic languages the descendants of the autochthonous peoples of Western Europe? (Reinach, *op. cit.* p. 38). Broca in replying to d'Omalius emphasized the fact which has been too often forgotten in this controversy, that race and language are not necessarily identical. In 1868 Professor Benfey of Göttingen argued for the south-east of Europe as the original home, while Ludwig Geiger in 1871 placed it in Germany, a view which in later times has had not a few supporters.

Truth to tell, however, we are not yet ready to fix the site of the original home. Before this can be done, many factors as yet imperfectly known must be more completely ascertained. The prehistoric conditions of Northern, Western, Central and South-eastern Europe have been carefully investigated, but important new discoveries are still continually being made. Investigation of other parts of Europe is less complete, and prehistoric conditions in Asia are at present very imperfectly known. In Western Europe two prehistoric races are known, the palaeolithic and the neolithic. The former, distinguished by their great skill in drawing figures of animals, especially the horse, the reindeer, and the mammoth, preceded the period of the Great Ice Age which rendered Northern Europe to the latitude of London and Berlin uninhabitable for a period, the length of which, as of all geological ages, cannot definitely be ascertained. For the present purpose, however, this is of less importance, because it is not claimed that the Indo-European stock is of so great antiquity. But when the ice again retreated it must have been long before Northern Europe could have maintained a population of human beings. The disappearance of the surface ice must have been followed by a long period when ice still remained underground, and the surface was occupied by swamps and barren tundras, as Northern Siberia is now. When a human population once more occupied Northern Europe it is impossible to estimate in years.

The problem may be attacked from the opposite direction. How long would it have taken for the Indo-European stock to spread from its original home to its modern areas of occupation? Some recent writers say that it is unnecessary to carry the stock back farther than 2500 B.C.—a period when the civilizations of Egypt and Mesopotamia were already ancient. Wherever the original home was situated, this date is probably fixed too low. The discussion, moreover, is in danger not only of moving in one vicious circle but in two. (*a*) The term "Indo-European stock" necessarily implies race, but why might not the language have been from the earliest times at which we can trace it the language of a mixed race? (*b*) It is usual to assume that the Indo-European stock was tall and blond, in fact much as the classical writers describe the early Germans. But the truth of this hypothesis is much more difficult to demonstrate. In most countries known to the ancients where blond hair prevailed, at the present day dark or brown hair is much more in evidence. Moreover the colour of fair hair often varies from childhood to middle life, and the flaxen hair of youth is very frequently replaced by a much darker shade in the adult. It has been often pointed out that many of Homer's heroes are *xanthoi*, and it is frequently argued that ξανθός means blond. This, however, is anything but certain, even when Vacher de Lapouge has collected all the passages in ancient writers which bear upon the subject. When Diodorus (v. 32) wishes to describe the children of the Galatae, by whom apparently he means the Germans, he says that their hair as children is generally *white*, but as they grow up it is assimilated to the colour of their fathers. The ethnological argument as to long-headed and short-headed races (dolichocephalic and brachycephalic) seems untrustworthy, because in countries described as dolichocephalic short skulls abound and vice versa. Moreover this classification, to which much more attention has been devoted than its inventor Retzius ever intended, is in itself unsatisfactory. The relation between the length and breadth of the head without consideration of the total size is clearly an unsatisfactory criterion. It is true that to the mathematician $\frac{3}{4}$ or $\frac{6}{8}$ or $\frac{9}{12}$ are of identical value, but, if it be also generally true that mental and physical energy are dependent on the size and weight of the brain, then the mere mathematical relation between length and breadth is of less importance than the size of the quantities. Anthropologists appear now to recognize this themselves.

The argument from physical geography seems more important. But here also no certain answer can be obtained till more is known of the conditions, in early times, of the eastern part of the area. According to Ratzel[2] the Caspian was once very much larger than it is now, and to the north of it there extended a great area of swamp, which made it practically impossible for the Indo-European race to have crossed north of the Caspian from either continent to the other. At an early period the Caspian and Black Sea were connected, and the Sea of Marmora and the Dardanelles were represented by a river which entered the Aegean at a point near the island of Andros. While the northern Aegean was still land divided only by a river, it is clear that migration from south-eastern Europe to Asia Minor, or reversely, might have taken place with ease. Even in much later times the Dardanelles have formed no serious barrier to migration in either direction. At the dawn of history, Thracian tribes crossed it and founded, it seems, the Phrygian and Armenian stock in Asia Minor; the Gauls at a later time followed the same road, as did Alexander the Great a generation earlier. At the end of the middle ages, Asia sent by way of the Dardanelles the invading Turks into Europe. The Greeks, a nation of seafarers, on the other hand reached Asia directly across the Aegean, using the islands, as it were, as stepping-stones.

Though much more attention has been devoted to the subject by recent writers than was earlier the practice, it is doubtful whether migration by sea has even now been assigned its full importance. The most mysterious people of antiquity, the Pelasgians, do not seem to be in all cases the same stock, as their name appears merely to mean "the people of the sea," Πελασγοί representing an earlier πελαγς-κοι, where πελαγς is the weak form of the stem of πέλαγος, "sea," and -κοι the ending so frequent in the names of peoples. A parallel to the sound changes may be seen in μίσγω, for *μιγ-σκω, by the side of μίγ-νυμι. As time goes on, evidence seems more and more to tend to confirm the truth of the great migrations by sea, recorded by Herodotus, of Lydians to Etruria, of Eteocretans both to east and west. An argument in favour of the original Indo-Europeans being seated in north-western Germany has been developed by G. Kossinna (*Zeitschrift für Ethnologie*, 1902, pp. 161-222) from the forms and ornamentation of ancient pottery. It has certainly not been generally received with favour, and as Kossinna himself affirms that the classification of prehistoric pottery is still an undeveloped science, his theory is clearly at present unequal to the weight of such a superstructure as he would build upon it. As the allied sciences are not prepared with an answer, it is necessary to fall back upon the Indo-European languages themselves. The attempt has often been made to ascertain both the position of the original home and the stage of civilization which the original community had reached from a consideration of the vocabulary for plants and animals common to the various languages of the Indo-European family. But the experience of recent centuries warns us to be wary in the application of this argument. If we cut off all past history and regard the language of the present day as we have perforce to regard our earliest records, two of the words most widely disseminated amongst the Indo-European people of Europe are *tobacco* and *potato*. Without historical records it would be impossible for us to discover that these words in their earliest European form had been borrowed from the Caribbean Indians. Most languages tend to adopt with an imported product the name given to it by its producers, though frequently misunderstanding arises, as in the case of the two words mentioned, the *potato* being properly the yam, and *tobacco* being properly the pipe, while *petum* or *petun* (cp. *petunia*) was the plant.[3]

The first treatise in which an attempt was made to work out the primitive Indo-European civilisation in detail was Adolphe Pictet's *Les Origines indo-européennes ou les Aryas primitifs* (1859–1863). The idyllic conditions in which, according to Pictet, early Indo-European man subsisted were accepted and extended by many enthusiastic successors. The father, the protector of the family (*pater* from *pā*, protect), and the mother (*mater* from *mā*, to produce) were surrounded by their children (Skt. *putra*), whose name implied that they kept everything clean and neat. The daughter was the milkmaid (Skt. *duhitā* from *duh*, milk), while the brother (Skt. *bhrātār*), derived from the root of *ferre*, "bear," was the natural protector of his sister, whose name, with some hesitation, is decided to mean "she who dwells with her brother," the notion of brother and sister marriage being, however, summarily rejected (ii. p. 365). The uncle and aunt are a second father and mother to the family, and for this reason *nepos*, Skt. *napāt*, is both nephew and grandson. The life of such families was pastoral but not nomad; there was a farmstead where the women were busied with housewifery and butter-making, while the men drove their flocks afield. The ox, the horse, the sheep, the goat and the pig were domesticated as well as the dog and the farmyard fowls, but it was in oxen that their chief wealth consisted. Hence a cow was offered to an honoured guest, cows were the object of armed raids upon their neighbours, and when a member of the family died, a cow was killed to accompany him in the next world. Even the phenomena of nature to their

Emery Walker sc.

naive imaginations could be represented by cows: the clouds of heaven were cows whose milk nourished the earth, the stars were a herd with the sun as the bull amongst them, the earth was a cow yielding her increase. Before the original community, which extended over a wide area with Bactria for its centre, had broken up, agriculture had begun, and barley, if not other cereals, and various leguminous plants were cultivated. Oxen drew the plough and the wagon. Industry also had developed with the introduction of agriculture; the carpenter with a variety of tools appears to construct farm implements, buildings and furniture, and the smith is no less busy. Implements had begun with stone, but by this time were made of bronze if not of iron, for the metals gold, silver, copper, tin were certainly known. Spinning and weaving had also begun; pottery was well developed. The flocks and herds and agriculture supplied food with plenty of variety; fermented liquors, mead, probably wine and perhaps beer, were used, not always in moderation. A great variety of military weapons had been invented, but geographical reasons prevented navigation from developing in Bactria. Towns existed and fortified places. The people were organized in clans, the clans in tribes. At the head of all, though not in the most primitive epoch, was the king, who reigned not by hereditary right, but by election. Though money had not yet been invented, exchange and barter flourished; there were borrowers and lenders, and property passed from father to son. Though we have no definite information as to their laws, justice was administered; murder, theft and fraud were punished with death, imprisonment or fine (*Résumé général* at end of vol. ii.).

Further investigation, however, did not confirm this ideally happy form of primitive civilization. Many of Pictet's etymologies were erroneous, many of his deductions based on very uncertain evidence. No recent writer adopts Pictet's views of the Indo-European family. But his list of domesticated animals is approximately correct, if domestication is used loosely simply of animals that might be kept by the Indo-European man about his homestead. Even at the present day domestication means different things in the case of different animals. A pig is not domesticated as a dog is; in areas like the Hebrides or western Ireland, where cattle and human beings share the two ends of the same building, domestication means something very different from the treatment of large herds on a farm extending to many hundreds of acres. In other respects the height of the civilization was vastly exaggerated. That the Indo-European people were agricultural as well as pastoral seems highly probable. But as Heraclides says of the Athamanes (*Fragmenta hist. Graec.* ii. 219), the women were the agriculturists, while the men were shepherds. Agriculture begins on a very small scale with the dibbling by means of a pointed stick of a few seeds of some plant which the women recognize as useful either for food or medicine, and is possible only when the people have ceased to be absolutely nomad and have fixed settlements for continuous periods of some length. The pastoral habit is broken down in men only by starvation, if the pasture-lands become too cramped through an excessive increase of population or are seized by a conqueror. As has been well said, "of all the ordinary means of gaining a livelihood—with the exception perhaps of mining—agriculture is the most laborious, and is never voluntarily adopted by men who have not been accustomed to it from their childhood" (Mackenzie Wallace, *Russia*, new ed. i. p. 266, in relating the conversion of the Bashkir Tatàrs to agriculture). Even the plough, in the primitive form of a tree stump with two branches, one forming the handle, the other the pole, was developed, and to this period may belong the representations in rock carvings in Sweden and the Alps of a pair of oxen in the plough (S. Müller, *Nordische Altertumskunde*, i. 205; Dechelette, *Manuel d'archéologie*, ii. pp. 492 ff.). The Indo-European civilization in its beginnings apparently belongs to the chalcolithic period (sometimes described by the barbarous term of Italian origin *eneolithic*) when copper, if not bronze had come in, but the use of stone for many purposes had not yet gone out. While primitive Indo-European man apparently knew, as has been said, the horse, ox, sheep, goat, pig and dog, it is to be observed that in their wild state at least these animals do not all affect the same kind of area. The horse is an animal of the open plain; the foal always accompanies the mother, for at first its neck is too short to allow it to graze, and the mare, unlike the cow, has no large udder in which to carry a great supply of milk. The cow, on the other hand, hides her calf in a brake when she goes to graze, and is more a woodland animal. The pig's natural habitat is the forest where beech mast, acorns, or chestnuts are plentiful. The goat is a climber and affects the heights, while the sheep also prefers short grass to the richer pastures suited to kine. To collect and tame all those animals implies control of an extensive and varied area.

What of the trees known to primitive Indo-European man? On this the greater part of the arguments regarding the original home have turned. The name for the *beech* extends through a considerable number of Indo-European languages, and it has generally been assumed that the beech must have been known from the first and therefore must have been a tree which flourished in the original home. Now the habitat of the beech is to the west of a line drawn from Königsberg to the Crimea. The argument assumes that its distribution was always the same. But nothing is more certain than that in different ages different trees succeed one another on the same soil. In the peat mosses of north-east Scotland are found the trunks of vast oaks which have no parallel among the trees which grow in the same district now, where the oak has a hard struggle to live at all, and where experience teaches the planter that coniferous trees will be more successful. On the coast of Denmark in the same way the conifer has replaced the beech since the days of the "kitchen middens," from which so much information as to the primitive inhabitants of that area has been obtained. But with regard to the names of trees there are two serious pitfalls which it is difficult to avoid. (*a*) It is common to give a tree the name of another which in habit it resembles. In England the oriental plane does not grow freely north of the Trent; accordingly, farther north the sycamore, which has a leaf that a casual observer might think similar, has usurped the name of the plane. (*b*) In the case of the beech (Lat. *fagus*), the corresponding Greek word φηγός does not mean *beech* but *oak*, or possibly, if one may judge from the magnificent trees of north-west Greece, the chestnut. It has been suggested that the word is connected with the verb φαγεῖν to eat, so that it was originally the tree with edible fruit and could thus be specialized in different senses in different areas. If, however, Bartholomae's connexion of the Kurd *būz*, "elm" (*Idg. Forschungen*, ix. 271) be correct, there can be no relation between φαγεῖν and φηγός, but the latter comes from a root **bhāuĝ*, in which the *g* would become *z* among the *satem* languages. The birch is a more widely spread tree than the beech, growing as luxuriantly in the Himalayas as in western Europe, but notwithstanding, the Latin *fraxinus*, which is almost certainly of the same origin, means not *birch* but *ash*, while the word akin to ash (Gr. ὀξύη) appears in Latin without the *k* suffix as *os-* in Latin *ornus*, "mountain ash," for an earlier **osinos*, cp. Old Bulgarian *jasenŭ* (the *j* has no etymological value), Welsh and Cornish *onnen*, from an original Celtic **onna* from **os-nā*. One of the most widely spread tree names is the word *tree* itself, which appears in a variety of forms, Gr. δρῦς, Goth *triu*; Skt. *dāru*, δόρυ, &c., which is sometimes as in Greek specially limited to the oak, while the Indian *deodar* (*deva-dāru*) is a conifer. O. Schrader, who in his remarkable book, *Sprachvergleichung und Urgeschichte* (1883, 3rd ed., 1906–1907), locates the original home in southern Russia, would allow the original community (ii. p. 178) to be partly within, partly without the beech line. The only other tree the name of which is widely spread is the willow: the English *with*, *withy*, Lat. *vitex*, Gr. ἰτέα for Ϝιτέα, Lithuanian *wýtis*, Zend *vaêti*. Otherwise the words for trees are limited to a small number of languages, and the meaning in different languages is widely different, as Gr. ἐλάτη, "pine," Old High German *linta*, "linden," with which go the Latin *linter*, "boat," and Lithuanian *lentà*, "board." The lime tree and the birch do not exist in Greece, and the Latin *betula* is a borrowing from Gaulish (Irish *bethe*), the native word *fraxinus*, as we have seen, being used for the *ash*. The equation of the Latin *taxus*, "yew," with Gr. τόξον, "bow," is no doubt correct; Schrader's equation of Skt. *dhanvan*, "bow," with the German *tanne*, "fir," must, if correct, show at least a change of material, for no wood is less well adapted for a bow than fir. The only conclusion that can be drawn with apparent certainty from the names of trees is that the original settlements were not in the southern peninsulas of Europe.

Some of the names for cultivated plants are widely spread, but like the names of trees do not always indicate the same thing. This is not surprising if we consider that the word *corn*, within the Teutonic languages alone, means wheat in England, oats in Scotland, rye in Germany, barley in Sweden, maize in the United States of America. Thus the Skt. *yáva* means corn or barley, in Zend corn (modern Persian *jav*, barley, but in the language of the Ossetes *yeu*, *yau* is millet), the Gk. ζεά is spelt, the Lithuanian *jawaĩ* corn, the Irish *éorna* barley (Schrader, *Sprachvergleichung*,[3] ii. p. 188). The word bere or barley itself is widely spread in Europe—Latin *far*, spelt, Goth, *barizeins*, "of barley," Old Norse *barr*, Old Slav, *bŭrŭ*, a kind of millet (*ibid.*). But the original habitat of the cultivated grain plants has not yet been clearly established, and circumstances of many kinds may occasion a change in the kind of grain cultivated, provided another can be found suitable to the climate. In early England it is clear that the prevalent crop was barley, for *barn* is the *bere-ern* or barley-house.

The earliest tree-fruits found in Europe are apparently those discovered by Edouard Piette as Mas d'Azil in a stratum which he places between palaeolithic and neolithic. They included nuts, plums, birdcherry, sloe, &c., and along with them was a little heap of grains of wheat. If Piette's observations are correct, this find must go back to a date long preceding the fruits found by Heer in the pile-dwellings of Switzerland. Here also cherry-stones were found, though the modern cherry is said to have been imported first by Lucullus in the first century B.C. from Cerasus in Pontus, whence its name. In the pile-dwellings a considerable number of apples were found. They were generally cut up into two or three pieces, apparently to be dried for winter use. In all probability they were wild apples of the variety *Pirus silvatica*, which is found across the whole of Central Europe from north to south (Buschan, *Vorgeschichtliche Botanik*, p. 166). The original habitat of the apple is uncertain, but it is supposed to be indigenous at any rate south of the Black Sea (Schrader, *Reallexikon*, s. v. *Apfelbaum*). The history of the name is obscure; it is often connected with the Campanian town Abella, which Virgil (*Aeneid*, vii. 740) calls *malifera*, "apple-bearing." Here also the material for fixing the site of the original habitat is untrustworthy.

The attempt has been made to limit the possible area by a consideration of three animals which are said not to occur in certain parts of it—(*a*) the eel, which is said not to be found in the Black Sea; (*b*) the honey bee, which is not found in that part of Central Asia drained by the Oxus and Jaxartes; (*c*) the tortoise, which is not found in northern areas. From evidence collected by Schrader from a specialist at Bucharest (*Sprachvergleichung*,[3] ii. p. 147) eels *are* found in the Black Sea. The argument, therefore, for excluding the area which drains into the Black Sea from the possible habitat of the primitive Indo-European community falls to the ground. Honey was certainly familiar at an early age, as is shown by the occurrence of the word **medhu*, Skt. *mádhu*, Gr. μέθυ (here the meaning has shifted from mead to wine), Irish *mid*, English *mead*, Old Slav. *medŭ*, Lithuanian *medùs* honey, *midùs* mead. Schrader, who is the first to utilize the name of the tortoise in this argument, points out (*op. cit.* p. 148) that forms from the same root occur in both a *centum* and a *satem* language—Gr. χελύς, χελώνη, Old Slav. *žĭly*, *želŭvĭ*—but that while it reaches far north in eastern Europe, it does not pass the 46th parallel of latitude in western Europe. This argument would make not only the German site for the original home which is supported by Kossinna and Hirt impossible, but also that of Scandinavia contended for by Penka.

From the foregoing it will be seen that the arguments for any given area are not conclusive. In the great plain which extends across Europe north of the Alps and Carpathians and across Asia north of the Hindu Kush there are few geographical obstacles to prevent the rapid spread of peoples from any part of its area to any other, and, as we have seen, the Celts and the Hungarians, &c., have, in the historical period, demonstrated the rapidity with which such migrations could be made. Such migration may possibly account for the appearance of a people using a *centum* language so far east as Turkestan. But our information as to Tocharish is still too fragmentary to decide the question. It is impossible here to discuss at any length the relations between the separate Indo-European languages, a subject which has formed, from somewhat different points of view, the subject of Kretschmer's *Einleitung in die Geschichte der griechischen Sprache* and Meillet's *Les Dialectes indo-européennes*.

Bibliography.—Besides the articles on the separate languages in this Encyclopaedia the following works are the most important for consultation: K. Brugmann (phonology and morphology) and B. Delbrück (syntax), *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (1886–1900), ed. 2, vol. i. (1897); of vol. ii. two large parts, including the stem formation and inflexion of the noun, the pronoun and the numerals, have been published in 1906 and 1909. A shorter work by Brugmann, *Kurze vergleichende Grammatik der indogermanischen Sprachen*, dealing mainly with Sanskrit, Greek, Latin, Germanic and Slavonic, appeared in three parts in 1902–1903. A good but less elaborate work is A. Meillet, *Introduction à l'étude comparative des langues indo-européennes* (1903, 2nd ed. 1908). For the ethnological argument: W. Z. Ripley, *The Races of Europe* (1900); G. Sergi, *The Mediterranean Race* (English edition, 1901). Other works, now largely superseded, which deal with this argument are K. Penka, *Origines Ariacae* (1883), and *Die Herkunft der Arier* (1886), and I. Taylor, *The Origin of the Aryans*, N.D. (1890). The ethnologists are no more in agreement than the philologists. For the arguments mainly from the linguistic side see especially O. Schrader, *Sprachvergleichung und Urgeschichte* (3rd ed., 2 vols., 1906–1907)—the second edition was translated into English by Dr F. B. Jevons under the title *Prehistoric Antiquities of the Aryan Peoples* (1890); *Reallexikon der indogermanischen Altertumskunde* (1901); M. Much, *Die Heimat der Indogermanen* (1902, 2nd ed. 1904); E. de Michelis, *L'Origine degli Indo-europei* (1903); H. Hirt, *Die Indogermanen* (2 vols., 1905–1907); S. Feist, *Europa im Lichte der Vorgeschichte und die Ergebnisse der vergleichenden indogermanischen Sprachwissenschaft*, 1910, in W. Sieglin's *Quellen und Forschungen zur alten Geschichte und Geographie*. Important for special sections of this question are S. Müller, *Nordische Altertumskunde* (2 vols., 1897–1898), and *Urgeschichte Europas* (1905); V. Hehn, *Kulturpflanzen und Haustiere* (1870), 7th ed. edited by O. Schrader, with contributions on botany by A. Engler (1902); J. Hoops, *Waldbäume und Kulturpflanzen im germanischen Altertum* (1905). Delbrück has devoted a special monograph to the I.-E. names of relationships, from which he shows that the I.-E. family was patriarchal, not matriarchal (*Die idg. Verwandtschaftsnamen*, 1889). E. Meyer, from Tocharish being a *centum* language, has revived with reserve the hypothesis of the Asiatic origin (*Geschichte des Altertums*,[2] I. 2, p. 801). (P. Gi.)

INDOLE, or Benzopyrrol, C_8H_7N, a substance first prepared by A. Baeyer in 1868. It may be synthetically obtained by distilling oxindole (C_8H_8NO) with zinc dust; by heating orthonitrocinnamic acid with potash and iron filings; by the reduction of indigo blue; by the action of sodium ethylate on orthoaminochlorstyrene; by boiling aniline with dichloracetaldehyde; by the dry distillation of ortho-tolyloxamic acid; by heating aniline with dichloracetal; by distilling a mixture of calcium formate and calcium anilidoacetate; and by heating pyruvic acid phenyl hydrazone with anhydrous zinc chloride. It is also formed in the pancreatic fermentation of albumen, and, in small quantities, by passing the vapours of mono- and dialkylanilines through a red-hot tube. It crystallizes in shining leaflets, which melt at 52° C. and boil at 245° C. (with decomposition), and is volatile in a current of steam. It is a feeble base, and gives a cherry-red coloration with a pine shaving. Many derivatives of indole are known. B-methyl indol or skatole occurs in human faeces.

INDONESIAN, a term invented by James Richardson Logan to describe the light-coloured non-Malay inhabitants of the Eastern Archipelago. It now denotes all those peoples of Malaysia and Polynesia who are not to be classified as Malays or Papuans, but are of Caucasic type. Among these are the Battaks of north Sumatra; many of the Bornean Dyaks and Philippine Islanders, and the large brown race of east Polynesia which includes Samoans, Maoris, Tongans, Tahitians, Marquesas Islanders and the Hawaiians.

See J. Richardson Logan, *The Languages and Ethnology of the Indian Archipelago* (1857).

INDORE, a native state of India in the central India agency, comprising the dominions of the Maharaja Holkar. Its area, exclusive of guaranteed holdings on which it has claims, is 9500 sq. m. and the population in 1901 was 850,690, showing a decrease of 23% in the decade, owing to the results of famine. As in the case of most states in central India the territory is not homogeneous, but distributed over several political charges. It has portions in four out of the seven charges of central India, and in one small portion in the Rajputana agency. The Vindhya range traverses the S. division of the state in a direction from east to west, a small part of the territory lying to the north of the mountains, but by much the larger part to the south. The latter is a portion of the valley of the Nerbudda, and is bounded on the south by the Satpura hills. Basalt and other volcanic formations predominate in both ranges, although there is also much sandstone. The Nerbudda flows through the state; and the valley at Mandlesar, in the central part, is between 600 and 700 ft. above the sea. The revenue is estimated at £350,000. The metre gauge railway from Khandwa to Mhow and Indore city, continued to Neemuch and Ajmere, was constructed in 1876.

The state had its origin in an assignment of lands made early in the 18th century to Malhar Rao Holkar, who held a command in the army of the Mahratta Peshwa. Of the Dhangar or shepherd caste, he was born in 1694 at the village of Hol near Poona, and from this circumstance the family derives its surname of Holkar. Before his death in 1766 Malhar Rao had added to his assignment large territorial possessions acquired by his armed power during the confusion of the period. By the end of that century the rulership had passed to another leader of the same clan, Tukoji Holkar, whose son, Jaswant Rao, took an important part in the contest for predominance in the Mahratta confederation. He did not, however, join the combined army of Sindha and the raja of Berar in their war against the British in 1803, though after its termination he provoked hostilities which led to his complete discomfiture. At first he defeated a British force that had marched against him under Colonel Monson; but when he made an inroad into British territory he was completely defeated by Lord Lake, and compelled to sign a treaty which deprived him of a large portion of his possessions. After his death his favourite mistress, Tulsi Bai, assumed the regency, until in 1817 she was murdered by the military commanders of the Indore troops, who declared for the peshwa on his rupture with the British government. After their defeat at Mehidpur in 1818, the state submitted by treaty to the loss of more territory, transferred to the British government its suzerainty over a number of minor tributary states, and acknowledged the British protectorate. For many years afterwards the administration of the Holkar princes was troubled by intestine quarrels, misrule and dynastic contentions, necessitating the frequent interposition of British authority;

and in 1857 the army, breaking away from the chief's control, besieged the British residency, and took advantage of the mutiny of the Bengal sepoys to spread disorder over that part of central India. The country was pacified after some fighting. In 1899 a British resident was appointed to Indore, which had formerly been directly under the agent to the governor-general in central India. At the same time a change was made in the system of administration, which was from that date carried on by a council. In 1903 the Maharaja, Shivaji Rao Holkar, G.C.S.I., abdicated in favour of his son Tukoji Rao, a boy of twelve, and died in 1908.

The City of Indore is situated 1738 ft. above the sea, on the river Saraswati, near its junction with the Khan. Pop. (1901) 86,686. These figures do not include the tract assigned to the resident, known as "the camp" (pop. 11,118), which is under British administration. The city is one of the most important trading centres in central India.

Indore Residency, a political charge in central India, is not co-extensive with the state, though it includes all of it except some outlying tracts. Area, 8960 sq. m.; pop. (1901) 833,410. (J. S. Co.)

INDORSEMENT, or Endorsement (from Med. Lat. *indorsare*, to write upon the *dorsum*, or back), anything written or printed upon the back of a document. In its technical sense, it is the writing upon a bill of exchange, cheque or other negotiable instrument, by one who has a right to the instrument and who thereby transmits the right and incurs certain liabilities. See Bill of Exchange.

INDO-SCYTHIANS, a name commonly given to various tribes from central Asia, who invaded northern India and founded kingdoms there. They comprise the Sakas, the Yue-Chi or Kushans and the Ephthalites or Hūnas.

INDRA, in early Hindu mythology, god of the clear sky and greatest of the Vedic deities. The origin of the name is doubtful, but is by some connected with *indu*, drop. His importance is shown by the fact that about 250 hymns celebrate his greatness, nearly one-fourth of the total number in the Rig Veda. He is represented as specially lord of the elements, the thunder-god. But Indra was more than a great god in the ancient Vedic pantheon. He is the patron-deity of the invading Aryan race in India, the god of battle to whose help they look in their struggles with the dark aborigines. Indra is the child of Dyaus, the Heaven. In Indian art he is represented as a man with four arms and hands; in two he holds a lance and in the third a thunderbolt. He is often painted with eyes all over his body and then he is called Sahasraksha, "the thousand eyed." He lost much of his supremacy when the triad Brahma, Siva and Vishnu became predominant. He gradually became identified merely with the headship of Swarga, a local vice-regent of the abode of the gods.

See A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897).

INDRE, a department of central France, formed in 1790 from parts of the old provinces of Berry, Orléanais, Marche and Touraine. Pop. (1906) 290,216, Area 2666 sq. m. It is bounded N. by the department of Loir-et-Cher, E. by Cher, S. by Creuse and Haute-Vienne, S.W. by Vienne and N.W. by Indre-et-Loire. It takes its name from the river Indre, which flows through it. The surface forms a vast plateau divided into three districts, the Boischaut, Champagne and Brenne. The Boischaut is a large well-wooded plain comprising seven-tenths of the entire area and covering the south, east and centre of the department. The Champagne, a monotonous but fertile district in the north, produces abundant cereal crops, and affords excellent pasturage for large numbers of sheep, celebrated for the fineness of their wool. The Brenne, which occupies the west of the department, was formerly marshy and unhealthy, but draining and afforestation have brought about considerable improvement.

The department is divided into the arrondissements of Châteauroux, Le Blanc, La Châtre and Issoudun, with 23 cantons and 245 communes. At Neuvy-St-Sépulchre there is a circular church of the 11th century, to which a nave was added in the 12th century, and at Mézières-en-Brenne there is an interesting church of the 14th century. At Levroux there is a fine church of the 13th century and the remains of a feudal fortress, and there is a magnificent château in the Renaissance style at Valençay.

INDRE-ET-LOIRE, a department of central France, consisting of nearly the whole of the old province of Touraine and of small portions of Orléanais, Anjou and Poitou. Pop. (1906) 337,916. Area 2377 sq. m. It is bounded N. by the departments of Sarthe and Loir-et-Cher, E. by Loir-et-Cher and Indre, S. and S.W. by Vienne and W. by Maine-et-Loire. It takes its name from the Loire and its tributary the Indre, which enter it on its eastern border and unite not far from its western border. The other chief affluents of the Loire in the department are the Cher, which joins it below Tours, and the Vienne, which waters the department's southern region. Indre-et-Loire is generally level and comprises the following districts: the Gâtine, a pebbly and sterile region to the north of the Loire, largely consisting of forests and heaths with numerous small lakes; the fertile Varenne or valley of the Loire; the Champeigne, a chain of vine-clad slopes, separating the valleys of the Cher and Indre; the Véron, a region of vines and orchards, in the angle formed by the Loire and Vienne; the plateau of Sainte-Maure, a hilly and unproductive district in the centre of which are found extensive deposits of shell-marl; and in the south the Brenne, traversed by the Claise and the Creuse and forming part of the marshy territory which extends under the same name into Indre.

Indre-et-Loire is divided into the arrondissements of Tours, Loches and Chinon, with 24 cantons and 282 communes. The chief town is Tours, which is the seat of an archbishopric; and Chinon, Loches, Amboise, Chenonceaux, Langeais and Azay-le-Rideau are also important places with châteaus. The Renaissance château of Ussé, and those of Luynes (15th and 16th centuries) and Pressigny-le-Grand (17th century) are also of note. Montbazon possesses the imposing ruins of a square donjon of the 11th and 12th centuries. Preuilly has the most beautiful Romanesque church in Touraine. The Sainte Chapelle (16th century) at Champigny is a survival of a château of the dukes of Bourbon-Montpensier. The church of Montrésor (1532) with its mausoleum of the family of Montrésor; that of St Denis-Hors (12th and 16th century) close to Amboise, with the curious mausoleum of Philibert Babou, minister of finance under Francis I. and Henry II.; and that of Ste Catherine de Fierbois, of the 15th century, are of architectural interest. The town of Richelieu, founded in 1631 by the famous minister of Louis XIII., preserves the enceinte and many of the buildings of the 17th century. Megalithic monuments are numerous in the department.

INDRI, a Malagasy word believed to mean "there it goes," but now accepted as the designation of the largest of the existing Malagasy (and indeed of all) lemurs. Belonging to the family *Lemuridae* (see Primates) it typifies the subfamily *Indrisinae*, which includes the avahi and the sifakas (*q.v.*). From both the latter it is distinguished by its rudimentary tail, measuring only a couple of inches in length, whence its name of *Indris brevicaudatus*. Measuring about 24 in. in length, exclusive of the tail, the indri varies considerably in colour, but is usually black, with a variable number of whitish patches, chiefly about the loins and on the fore-limbs. The forests of a comparatively small tract on the east coast of Madagascar form its home. Shoots, flowers and berries form the food of the indri, which was first discovered by the French traveller and naturalist Pierre Sonnerat in 1780. (R. L.*)

INDUCTION (from Lat. *inducere*, to lead into; cf. Gr. ἐπαγωγή), in logic, the term applied to the process of discovering principles by the observation and combination of particular instances. Aristotle, who did so much to establish the laws of deductive reasoning, neglected induction, which he identified with a complete enumeration of facts; and the schoolmen were wholly concerned with syllogistic logic. A new era opens with Bacon, whose writings all preach the principle of investigating the laws of nature with the purpose of improving the conditions of human life. Unluckily his mind was still enslaved by the formulae of the quasi-mechanical scholastic logic. He supposed that natural laws would disclose themselves by the accumulation and due arrangement of instances without any need for original speculation on the part of the investigator. In his *Novum Organum* there are directions for drawing up the various kinds of lists of instances. For two hundred years after Bacon's death little was done towards the theory of induction; the reason being, probably, that the practical scientists knew no logic, while the university logicians, with their conservative devotion to the syllogism, knew no science. Whewell's *Philosophy of the Inductive Sciences* (1840), the work of a thoroughly equipped scientist, if not of a great philosopher, shows due appreciation of the cardinal point neglected by Bacon, the function of theorizing in inductive research. He saw that science advances only in so far as the mind of the inquirer is able to suggest organizing ideas whereby our observations and experiments are colligated into intelligible system. In this respect J. S. Mill is inferior to Whewell: throughout his *System of Logic* (1843) he ignores the constitutive work of the mind, and regards knowledge as the merely passive reception of sensuous impressions. His work was intended mainly to reduce the procedure of induction to a regular demonstrative system like that of the syllogism; and it was for this purpose that he formulated his famous Four Methods of Experimental Inquiry. His work has contributed greatly to the systematic treatment of induction. But it must be remarked that his Four Methods are not methods of formal proof, as their author supposed, but methods whereby hypotheses are suggested or tested. The actual proof of an hypothesis is never formal, but always lies in the tests of experiment or observation to which it is subjected.

The current theory of induction as set forth in the standard works is so far satisfactory that it combines the merit of Whewell's treatment with that of Mill's; and yet it is plain that there is much for the logician of the future to accomplish. The most important faculty in scientific inquiry is the faculty of suggesting new and valuable hypotheses. But no one has ever given any explanation how the hypotheses arise in the mind: we attribute it to "genius," which, of course, is no explanation at all. The logic of discovery, in the higher sense of the term, simply has no existence. Another important but neglected province of the subject is the relation of scientific induction to the inductions of everyday life. There are some who think that a study of this relation would quite transform the accepted view of induction. Consider such a piece of reasoning as may be heard any day in a court of justice, a detective who explains how in his opinion a certain burglary was effected. If all reasoning is either deductive or inductive, this must be induction. And yet it does not answer to the accepted definition of induction, "the process of discovering a general principle by observation of particular instances": what the detective does is to reconstruct a particular crime; he evolves no general principle. Such reasoning is used by every man in every hour of his life: by it we understand what people are doing around us, and what is the meaning of the sense-impressions which we receive. In the logic of the future it will probably be recognized that scientific induction is only one form of this universal constructive or reconstructive faculty. Another most important question closely akin to that just mentioned is the true relation between these reasoning processes and our general life as active intelligent beings. How is it that the detective is able to understand the burglar's plan of action?—the military commander to forecast the enemy's plan of campaign? Primarily, because he himself is capable of making such plans. Men as active creatures co-operating with their fellow-men are incessantly engaged in forming plans and in apprehending the plans of those around them. Every plan may be viewed as a form of induction; it is a scheme invented to meet a given situation, an hypothesis which is put to the test of events, and is verified or refuted by practical success or failure. Such considerations widen still farther our view of scientific induction and help us to understand its relation to ordinary human thought and activity. The scientific investigator in his inductive stage is endeavouring to make out the plan on which his material is constructed. The phenomena serve as indications to help him in framing his hypothesis, generally a guess at first, which he proceeds to verify by experiment and the collection of additional facts. In the deductive stage he assumes that he has made out the plan and can apply it to the discovery of further detail. He has the capacity of detecting plans in nature because he is wont to form plans for practical purposes.

There are good recent accounts of induction in Welton's *Manual of Logic*, ii., in H. W. B. Joseph's *Introduction to Logic*, and in W. R. Boyce Gibson's *Problem of Logic*; see also LOGIC. (H. ST.)

INDUCTION COIL, an electrical instrument consisting of two coils of wire wound one over the other upon a core consisting of a bundle of iron wires. One of these circuits is called the primary circuit and the other the secondary circuit. If an alternating or intermittent continuous current is passed through the primary circuit, it creates an alternating or intermittent magnetization in the iron core, and this in turn creates in the secondary circuit a secondary current which is called the induced current. For most purposes an induction coil is required which is capable of giving in the secondary circuit intermittent currents of very high electromotive force, and to attain this result the secondary circuit must as a rule consist of a very large number of turns of wire. Induction coils are employed for physiological purposes and also in connexion with telephones, but their great use at the present time is in connexion with the production of high frequency electric currents, for Röntgen ray work and wireless telegraphy.

Early history.

The instrument began to be developed soon after Faraday's discovery of induced currents in 1831, and the subsequent researches of Joseph Henry, C. G. Page and W. Sturgeon on the induction of a current. N. J. Callan described in 1836 the construction of an electromagnet with two separate insulated wires, one thick and the other thin, wound on an iron core together. He provided the primary circuit of this instrument with an interrupter, and found that when the primary current was rapidly intermitted, a series of secondary currents was induced in the fine wire, of high electromotive force and considerable strength. Sturgeon in 1837 constructed a similar coil, and provided the primary circuit with a mercury interrupter operated by hand. Various other experimentalists took up the construction of the induction coil, and to G. H. Bachhoffner is due the suggestion of employing an iron core made of a bundle of fine iron wires. At a somewhat later date Callan constructed a very large induction coil containing a secondary circuit of very great length of wire. C. G. Page and J. H. Abbot in the United States, between 1838 and 1840, also constructed some large induction coils.[1] In all these cases the primary circuit was interrupted by a mechanically worked interrupter. On the continent of Europe the invention of the automatic primary circuit interrupter is generally attributed to C. E. Neeff and to J. P. Wagner, but it is probable that J. W. M'Gauley, of Dublin, independently invented the form of hammer break now employed. In this break the magnetization of the iron core by the primary current is made to attract an iron block fixed to the end of a spring, in such a way that two platinum points are separated and the primary circuit thus interrupted. It was not until 1853 that H. L. Fizeau added to the break the condenser which greatly improved the operation of the coil. It 1851 H. D. Rühmkorff (1803–1877), an instrument-maker in Paris, profiting by all previous experience, addressed himself to the problem of increasing the electromotive force in the secondary circuit, and induction coils with a secondary circuit of long fine wire have generally, but unnecessarily, been called Rühmkorff coils. Rühmkorff, however, greatly lengthened the secondary circuit, employing in some coils 5 or 6 m. of wire. The secondary wire was insulated with silk and shellac varnish,

[1] For a full history of the early development of the induction coil see J. A. Fleming, *The Alternate Current Transformer*, vol. ii., chap. i.

and each layer of wire was separated from the next by means of varnished silk or shellac paper; the secondary circuit was also carefully insulated from the primary circuit by a glass tube. Rühmkorff, by providing with his coil an automatic break of the hammer type, and equipping it with a condenser as suggested by Fizeau, arrived at the modern form of induction coil. J. N. Hearder in England and E. S. Ritchie in the United States began the construction of large coils, the last named constructing a specially large one to the order of J. P. Gassiot in 1858. In the following decade A. Apps devoted great attention to the production of large induction coils, constructing some of the most powerful coils in existence, and introduced the important improvement of making the secondary circuit of numerous flat coils of wire insulated by varnished or paraffined paper. In 1869 he built for the old Polytechnic Institution in London a coil having a secondary circuit 150 m. in length. The diameter of the wire was 0·014 in., and the secondary bobbin when complete had an external diameter of 2 ft. and a length of 4 ft. 10 ins. The primary bobbin weighed 145 ℔, and consisted of 6000 turns of copper wire 3770 yds. in length, the wire being ·095 of an inch in diameter. Excited by the current from 40 large Bunsen cells, this coil could give secondary sparks 30 in. in length. Subsequently, in 1876, Apps constructed a still larger coil for William Spottiswoode, which is now in the possession of the Royal Institution. The secondary circuit consisted of 280 m. of copper wire about 0·01 of an inch in diameter, forming a cylinder 37 in. long and 20 in. in external diameter; it was wound in flat disks in a large number of separate sections, the total number of turns being 341,850. Various primary circuits were employed with this coil, which when at its best could give a spark of 42 in. in length.

Construction.

A general description of the mode of constructing a modern induction coil, such as is used for wireless telegraphy or Röntgen ray apparatus, is as follows: The iron core consists of a bundle of soft iron wires inserted in the interior of an ebonite tube. On the outside of this tube is wound the primary circuit, which generally consists of several distinct wires capable of being joined either in series or parallel as required. Over the primary circuit is placed another thick ebonite tube, the thickness of the walls of which is proportional to the spark-producing power of the secondary circuit. The primary coil must be wholly enclosed in ebonite, and the tube containing it is generally longer than the secondary bobbin. The second circuit consists of a number of flat coils wound up between paraffined or shellaced paper, much as a sailor coils a rope. It is essential that no joints in this wire shall occur in inaccessible places in the interior. A machine has been devised by Leslie Miller for winding secondary circuits in flat sections without any joints in the wire at all (British Patent, No. 5811, 1903). A coil intended to give a 10 or 12 in. spark is generally wound in this fashion in several hundred sections, the object of this mode of division being to prevent any two parts of the secondary circuit which are at great differences of potential from being near to one another, unless effectively insulated by a sufficient thickness of shellaced or paraffined paper. A 10-in. coil, a size very commonly used for Röntgen ray work or wireless telegraphy, has an iron core made of a bundle of soft iron wires No. 22 S.W.G., 2 in. in diameter and 18 in. in length. The primary coil wound over this core consists of No. 14 S.W.G. copper wire, insulated with white silk laid on in three layers and having a resistance of about half an ohm. The insulating ebonite tube for such a coil should not be less than $\frac{1}{4}$ in. in thickness, and should have two ebonite cheeks on it placed 14 in. apart. This tube is supported on two hollow pedestals down which the ends of the primary wire are brought. The secondary coil consists of No. 36 or No. 32 silk-covered copper wire, and each of the sections is prepared by winding, in a suitable winding machine, a flat coiled wire in such a way that the two ends of the coil are on the outside. The coil should not be wound in less than a hundred sections, and a larger number would be still better. The adjacent ends of consecutive sections are soldered together and insulated, and the whole secondary coil should be immersed in paraffin wax. The completed coil (fig. 1) is covered with a sheet of ebonite and mounted on a base board which, in some cases, contains the primary condenser within it and carries on its upper surface a hammer break. For many purposes, however, it is better to separate the condenser and the break from the coil. Assuming that a hammer break is employed, it is generally of the Apps form. The interruption of the primary circuit is made between two contact studs which ought to be of massive platinum, and across the break points is joined the primary condenser. This consists of a number of sheets of paraffined paper interposed between sheets of tin foil, alternate sheets of the tin foil being joined together (see LEYDEN JAR). This condenser serves to quench the break spark. If the primary

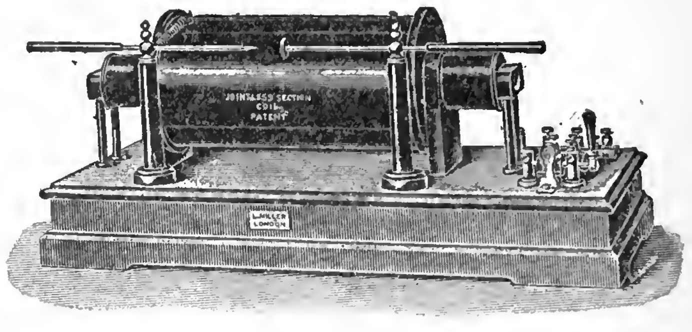

FIG. 1.

condenser is not inserted, the arc or spark which takes place at the contact points prolongs the fall of magnetism in the core, and since the secondary electromotive force is proportional to the rate at which this magnetism changes, the secondary electromotive force is greatly reduced by the presence of an arc-spark at the contact points. The primary condenser therefore serves to increase the suddenness with which the primary current is interrupted, and so greatly increases the electromotive force in the secondary circuit. Lord Rayleigh showed (*Phil. Mag.*, 1901, 581) that if the primary circuit is interrupted with sufficient suddenness, as for instance if it is severed by a bullet from a gun, then no condenser is needed. No current flows in the secondary circuit so long as a steady direct current is passing through the primary, but at the moments that the primary circuit is closed and opened two electromotive forces are set up in the secondary; these are opposite in direction, the one induced by the breaking of the primary circuit being by far the stronger. Hence the necessity for some form of circuit breaker, by the continuous action of which there results a series of discharges from one secondary terminal to the other in the form of sparks.

Interrupters or Breaks.

The hammer break is somewhat irregular in action and gives a good deal of trouble in prolonged use; hence many other forms of primary circuit interrupters have been devised. These may be classified as (1) hand- or motor-worked dipping interrupters employing mercury or platinum contacts; (2) turbine mercury interrupters; (3) electrolytic interrupters. In the first class a steel or platinum point, operated by hand or by a motor, is periodically immersed in mercury and so serves to close the primary circuit. To prevent oxidation of the mercury by the spark and break it must be covered with oil or alcohol. In some cases the interruption is caused by the continuous rotation of a motor either working an eccentric which operates the plunger, or, as in the Mackenzie-Davidson break, rotating a slate disk having a metal stud on its surface, which is thus periodically immersed in mercury in a vessel. A better class of interrupter is the mercury turbine interrupter. In this some form of rotating turbine pump pumps mercury from a vessel and squirts it in a jet against a copper plate. Either the copper plate or the jet is made to revolve rapidly by a motor, so that the jet by turns impinges against the plate and escapes it; the mercury and plate are both covered with a deep layer of alcohol or paraffin oil, so that the jet is immersed in an insulating fluid. In a recent form the chamber in which the jet works is filled with coal gas. The current supplied to the primary circuit of the coil travels from the mercury in the vessel through the jet to the copper plate, and hence is periodically interrupted when the jet does not impinge against the plate. Mercury turbine breaks are much employed in connexion with large induction coils used for wireless telegraphy on account of their regular action and the fact that the number of interruptions per second can be controlled easily by regulating the speed of the motor which rotates the jet. But all mercury breaks employing paraffin or alcohol as an insulating medium are somewhat troublesome to use because of the necessity of periodically cleaning the mercury. Electrolytic interrupters were first brought to notice by Dr A. R. B. Wehnelt in 1898 (*Elektrotechnische Zeitschrift*, January 20th, 1899). He showed that if a large lead plate was placed in dilute sulphuric acid as a cathode, and a thick platinum wire protruding for a distance of about one millimetre beyond a glass or porcelain tube into which it tightly fitted was used as an anode, such an arrangement when inserted in the circuit of a primary coil gave rise to a rapid intermittency in the primary current. It is essential that the platinum wire should be the anode or positive pole. The frequency of the Wehnelt break can be adjusted by regulating the extent to which the platinum wire protrudes through the porcelain tube, and in modern electrolytic breaks several platinum anodes are employed. This break can be employed with any voltage between 30 and 250. The Caldwell interrupter, a modification of the Wehnelt break, consists of two electrodes immersed in dilute sulphuric acid, one of them being enclosed by a glass vessel which has a small hole in it capable of being more or less closed by a tapered glass plug. It differs from the Wehnelt break in that there is no platinum to wear away and it requires less current; hence finer regulation of the coil to the current can be obtained. It will also work with either direct or alternating currents. The hammer and mercury turbine breaks can be arranged to give interruptions from about 10 per second up to about 50 or 60. The electrolytic breaks are capable of working at a higher speed, and under some conditions will give interruptions up to a thousand per second. If the secondary terminals of the induction coils are connected to spark balls placed a short distance apart, then with an electrolytic break the discharge has a flame-like character resembling an alternating current arc. This type of break is therefore preferred for Röntgen ray work since it makes less flickering upon the screen, but its advantages in the case of wireless telegraphy are not so marked. In the Grisson interrupter the primary circuit of the induction coil is divided into two parts by a middle terminal, so that a current flowing in at this point and dividing equally between the two halves does not magnetize the iron. This terminal is connected to one pole of the battery, the other two terminals being connected alternately to the opposite pole by means of a revolving commutator which (1) passes a current through one half of the primary, thus magnetizing the core; (2) passes a current through both halves in opposite directions, thus annulling the magnetization; (3) passes a current through the second half of the primary, thus reversing the magnetization of the core; and (4) passes a current in both halves through opposite directions, thus again annulling the magnetization. As this series of operations can be performed without interrupting a large current through the inductive circuit there is not much spark at the commutator, and the speed of commutation can be regulated so as to obtain the best results due to a resonance between the primary and secondary circuits. Another device due to Grisson is the electrolytic condenser interrupter. If a plate of aluminium and one of carbon or iron is placed in an electrolyte yielding oxygen, this aluminium-carbon or aluminium-iron cell can pass current in one direction but not in the other. Much greater resistance is experienced by a current flowing from the aluminium to the iron than in the opposite direction, owing to the formation of a film of aluminic hydroxide on the aluminium. If then a cell consisting of a number of aluminium plates alternating with iron plates or carbon in alkaline solution is inserted in the primary circuit of an induction coil, the application of an electromotive force in the right direction will cause a transitory current to flow through the coil until the electrolytic condenser is charged. By the use of a proper commutator the position of the electrolytic cell in the circuit can be reversed and another transitory primary current created. This interrupted flow of electricity through the primary circuit provides the intermittent magnetization of the core necessary to produce the secondary electromotive force. This operation of commutation can be conducted without much spark at the commutator because the circuit is interrupted at the time when there is no current in it. In the case of the electrolytic condenser no supplementary paraffined paper condenser is necessary as in the case of the hammer or mercury interrupters.

High Frequency Coils.

An induction coil for the transformation of alternating current is called a transformer (*q.v.*). One type of high frequency current transformer is called an *oscillation transformer* or sometimes a *Tesla coil*. The construction of such a coil is based on different principles from that of the coil just described. If the secondary terminals of an ordinary induction coil or transformer are connected to a pair of spark balls (fig. 2), and if these are also connected to

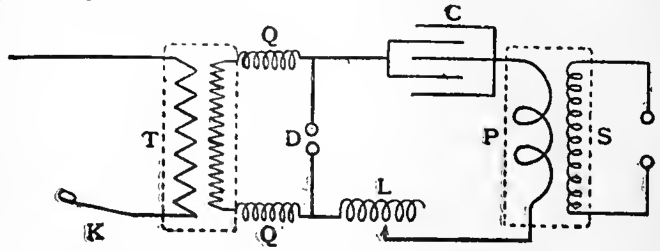

FIG. 2.—Arrangements for producing High Frequency Currents.

a glass plate condenser or Leyden jar of ordinary type joined in series with a coil of wire of low resistance and few turns, then at each break of the primary circuit of the ordinary induction coil a secondary electromotive force is set up which charges the Leyden jar, and if the spark balls are set at the proper distance, this charge is succeeded by a discharge consisting of a movement of electricity backwards and forwards across the spark gap, constituting an oscillatory electric discharge (see ELECTROKINETICS). Each charge of the jar may produce from a dozen to a hundred electric oscillations which are in fact brief electric currents of gradually decreasing strength. If the circuit of few turns and low resistance through which this discharge takes place is overlaid with another circuit well insulated from it consisting of a large number of turns of finer wire, the inductive action between the two circuits creates in the secondary a smaller series of electric oscillations of higher potential. Between the terminals of this last-named coil we can then produce a series of discharges each of which consists in an extremely rapid motion of electricity to and fro, the groups of oscillations being separated by intervals of time corresponding to the frequency of the break in the primary circuit of the ordinary induction coil charging the Leyden jar or condenser. These high frequency discharges differ altogether in character from the secondary discharges of the ordinary induction coil. Theory shows that to produce the best results the primary circuit of the oscillation transformer should consist of only one thick turn of wire or, at most, but of a few turns. It is also necessary that the two circuits, primary and secondary, should be well insulated from one another, and for this purpose the oscillation transformer is immersed in a box or vessel full of highly insulating oil. For full details N. Tesla's original Papers must be consulted (see *Journ. Inst. Elect. Eng.* 21, 62).

In some cases the two circuits of the Tesla coil, the primary and secondary, are sections of one single coil. In this form the arrangement is called a *resonator* or *auto transformer*, and is much used for producing high frequency discharges for medical purposes. The construction of a resonator is as follows: A bare copper wire is wound upon an ebonite or wooden cylinder or frame, and one end of it is connected to the outside of a Leyden jar or battery of Leyden jars, the inner coating of which is connected to one spark ball of the ordinary induction coil. The other spark ball is connected to a point on the above-named copper wire not very far from the lower end. By adjusting this contact, which is movable, the electric oscillations created in the short section of the resonator coil produce by resonance oscillations in the longer free section, and a powerful high frequency electric brush or discharge is produced at the free end of the resonator spiral. An electrode or wire connected with this free end therefore furnishes a high frequency glow discharge which has been found to have valuable therapeutic powers.

Theory of Oscillation Transformers.

The general theory of an oscillation transformer containing capacity and inductance in each circuit has been given by Oberbeck, Bjerknes and Drude.[1] Suppose there are two circuits, each consisting of a coil of wire, the two being superimposed or adjacent, and let each circuit contain a condenser or Leyden jar in series with the circuit, and let one of these circuits contain a spark gap, the other being closed (fig. 3). If to the spark balls the secondary terminals of an ordinary induction coil are connected, and these spark balls are adjusted near one another, then when the ordinary coil is set in operation, sparks pass between the balls and oscillatory discharges take place in the circuit containing the spark gap. These oscillations induce other oscillations in the second circuit. The two circuits have a certain mutual inductance M, and each circuit has self inductance L_1 and L_2. If then the capacities in the two circuits are denoted by C_1 and C_2 the following simultaneous equations express the relation of the currents, i_1 and i_2, and potentials, v_1, and v_2, in the primary and secondary circuits respectively at any instant:—

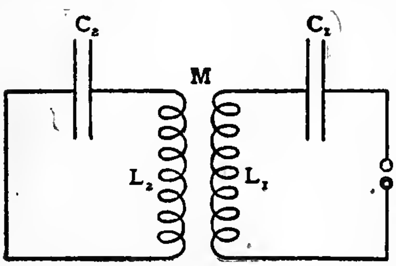

FIG. 3.

C_1, Condenser in primary circuit.
C_2, Condenser in secondary circuit.
L_1, Inductance in primary circuit.
L_2, Inductance in secondary circuit.

$$L_1\frac{di_1}{dt}+M\frac{di_2}{dt}+R_1i_1+v_1=0,$$
$$L_2\frac{di_2}{dt}+M\frac{di_1}{dt}+R_2i_2+v_2=0,$$

R_1 and R_2 being the resistances of the two circuits. If for the moment we neglect the resistances of the two circuits, and consider that the oscillations in each circuit follow a simple harmonic law $i=I\sin pt$ we can transform the above equations into a biquadratic

$$p^4+p^2\frac{L_1C_1+L_2C_2}{C_1C_2(L_1L_2-M^2)}+\frac{1}{C_1C_2(L_1L_2-M^2)}=0.$$

The capacity and inductance in each circuit can be so adjusted that their products are the same number, that is $C_1L_1=C_2L_2=CL$. The two circuits are then said to be in resonance or to be tuned together. In this particular and unique case the above biquadratic reduces to

$$p^2=\frac{1}{CL}\cdot\frac{1\pm k}{1-k^2},$$

where k is written for $M\sqrt{(L_1L_2)}$ and is called the *coefficient of coupling*. In this case of resonant circuits it can also be shown that the maximum potential differences at the primary and secondary condenser terminals are determined by the rule $V_1/V_2=2\sqrt{C_2}/\sqrt{C_1}$. Hence the transformation ratio is not determined by the relative number of turns on the primary and secondary circuits, as in the case of an ordinary alternating current transformer (see TRANSFORMERS), but by the ratio of the capacity in the two oscillation circuits. For full proofs of the above the reader is referred to the original papers.

Each of the two circuits constituting the oscillation transformer taken separately has a natural time period of oscillation; that is to say, if the electric charge in it is disturbed, it oscillates to and fro in a certain constant period like a pendulum and therefore with a certain frequency. If the circuits have the same frequency when separated they are said to be isochronous. If n stands for the natural frequency of each circuit, where $n=p/2\pi$ the above equations show that when the two circuits are coupled together, oscillations set up in one circuit create oscillations of two frequencies in the secondary circuit. A mechanical analogue to the above electrical effect can be obtained as follows: Let a string be strung loosely between two fixed points, and from it let two other strings of equal length hang down at a certain distance apart, each of them having a weight at the bottom and forming a simple pendulum. If one pendulum is set in oscillation it will gradually impart this motion to the second, but in so doing it will bring itself to rest; in like manner the second pendulum being set in oscillation gives back its motion to the first. The graphic representation, therefore, of the motion of each pendulum would be a line as in fig. 4. Such a curve

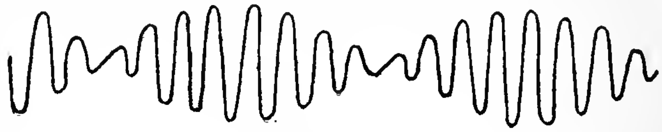

FIG. 4.

represents the effect in music known as beats, and can easily be shown to be due to the combined effect of two simple harmonic motions or simple periodic curves of different frequency superimposed. Accordingly, the effect of inductively coupling together two electrical circuits, each having capacity and inductance, is that if oscillations are started in one circuit, oscillations of two frequencies are found in the secondary circuit, the frequencies differing from one another and differing from the natural frequency of each circuit taken alone. This matter is of importance in connexion with wireless telegraphy (see TELEGRAPH), as in apparatus for conducting it, oscillation transformers as above described, having two circuits in resonance with one another, are employed.

INDULGENCE (Lat. *indulgentia*, *indulgere*, to grant, concede), in theology, a term defined by the official catechism of the Roman Catholic Church in England as "the remission of the temporal punishment which often remains due to sin after its guilt has been forgiven." This remission may be either total (*plenary*) or partial, according to the terms of the Indulgence. Such remission was popularly called a *pardon* in the middle ages—a term which still survives, *e.g.* in Brittany.

The theory of Indulgences is based by theologians on the following texts: 2 Samuel (Vulgate, 2 Kings) xii. 14; Matt. xvi. 19 and xviii. 17, 18; 1 Cor. v. 4, 5; 2 Cor. ii. 6-11; but the practice itself is confessedly of later growth. As Bishop Fisher says in his Confutation of Luther, "in the early church, faith in Purgatory and in Indulgences was less necessary than now. . . . But in our days a great part of the people would rather cast off Christianity than submit to the rigour of the [ancient] canons: wherefore it is a most wholesome dispensation of the Holy Ghost that, after so great a lapse of time, the belief in purgatory and the practice of Indulgences have become generally received among the orthodox" (*Confutatio*, cap. xviii.; cf. Cardinal Caietan, *Tract. XV. de Indulg.* cap. i.). The nearest equivalent in the ancient Church was the local and temporary African practice of restoring lapsed Christians to communion at the intercession of confessors and prospective martyrs in prison. But such reconciliations differed from later Indulgences in at least one essential particular, since they brought no remission of ecclesiastical penance save in very exceptional cases. However, as the primitive practice of public penance for sins died out in the Church, there grew up a system of equivalent, or nominally equivalent, private penances. Just as many of the punishments enjoined by the Roman criminal code were gradually commuted by medieval legislators for pecuniary fines, so the years or months of fasting enjoined by the earlier ecclesiastical codes were commuted for proportionate fines, the recitation of a certain number of psalms, and the like. "Historically speaking, it is indisputable that the practice of Indulgences in the medieval

[1] See A. Oberbeck, *Wied. Ann.* (1895), 55, p. 623; V. F. R. Bjerknes, *d.* (1895), 55, p. 121, and (1891), 44, p. 74; and P. K. L. Drude, *Ann. Phys.* (1904), 13, p. 512.

church arose out of the authoritative remission, in exceptional cases, of a certain proportion of this canonical penalty. At the same time, according to Catholic teaching, such Indulgence was not a mere permission to omit or postpone payment, but was in fact a *discharge* from the debt of temporal punishment which the sinner owed. The authority to grant such discharge was conceived to be included in the power of binding and loosing committed by Christ to His Church; and when in the course of time the vaguer theological conceptions of the first ages of Christianity assumed scientific form and shape at the hands of the Schoolmen, the doctrine came to prevail that this discharge of the sinner's debt was made through an application to the offender of what was called the "Treasure of the Church" (Thurston, p. 315). "What, then, is meant by the 'Treasure of the Church'? . . . It consists primarily and completely of the merit and satisfaction of Christ our Saviour. It includes also the superfluous merit and satisfaction of the Blessed Virgin and the Saints. What do we mean by the word 'superfluous'? In one way, as I need not say, a saint has no superfluous merit. Whatever he has, he wants it all for himself, because, the more he merits on earth (by Christ's grace) the greater is his glory in heaven. But, speaking of mere satisfaction for punishment due, there cannot be a doubt that some of the Saints have done more than was needed in justice to expiate the punishment due to their own sins . . . It is this 'superfluous' expiation that accumulates in the Treasure of the Church" (Bp. of Newport, p. 166). It must be noted that this theory of the "Treasure" was not formulated until some time after Indulgences in the modern sense had become established in practice. The doctrine first appeared with Alexander of Hales (*c.* 1230) and was at once adopted by the leading schoolmen. Clement VI. formally confirmed it in 1350, and Pius VI. still more definitely in 1794.

The first definite instance of a *plenary* Indulgence is that of Urban II. for the First Crusade (1095). A little earlier had begun the practice of *partial* Indulgences, which are always expressed in terms of days or years. However definite may have been the ideas originally conveyed by these notes of time, their first meaning has long since been lost. Eusebius Amort, in 1735, admits the gravest differences of opinion; and the Bishop of Newport writes (p. 163) "to receive an Indulgence of a year, for example, is to have remitted to one so much temporal punishment as was represented by a year's canonical penance. If you ask me to define the amount more accurately, I say that it cannot be done. No one knows how severe or how long a Purgatory was, or is, implied in a hundred days of canonical penance." The rapid extension of these time-Indulgences is one of the most remarkable facts in the history of the subject. Innocent II., dedicating the great church of Cluny in 1132, granted as a great favour a forty days' Indulgence for the anniversary. A hundred years later, all churches of any importance had similar indulgences; yet Englishmen were glad even then to earn a pardon of forty days by the laborious journey to the nearest cathedral, and by making an offering there on one of a few privileged feast-days. A century later again, Wycliffe complains of Indulgences of two thousand years for a single prayer (ed. Arnold, i. 137). In 1456, the recitation of a few prayers before a church crucifix earned a Pardon of 20,000 years for every such repetition (Glassberger in *Analecta Franciscana*, ii. 368): "and at last Indulgences were so freely given that there is now scarcely a devotion or good work of any kind for which they cannot be obtained" (Arnold & Addis, *Catholic Dictionary*, s.v.). To quote again from Father Thurston (p. 318): "In imitation of the prodigality of her Divine Master, the Church has deliberately faced the risk of depreciation to which her treasure was exposed . . . . The growing effeminacy and corruption of mankind has found her censures unendurable . . . and the Church, going out into the highways and the hedges, has tried to entice men with the offer of generous Indulgence." But it must be noted that, according to the orthodox doctrine, not only can an Indulgence not remit future sins, but even for the past it cannot take full effect unless the subject be truly contrite and have confessed (or intend shortly to confess) his sins.

This salutary doctrine, however, has undoubtedly been obscured to some extent by the phrase *a poena et a culpa*, which, from the 13th century to the Reformation, was applied to Plenary Indulgences. The prima-facie meaning of the phrase is that the Indulgence itself frees the sinner not only from the temporal penalty (*poena*) but also from the guilt (*culpa*) of all his sins: and the fact that a phrase so misleading remained so long current shows the truth of Father Thurston's remark: "The laity cared little about the analysis of it, but they knew that the *a culpa et poena* was the name for the biggest thing in the nature of an Indulgence which it was possible to get" (*Dublin Review*, Jan. 1900). The phrase, however, was far from being confined to the unlearned. Abbot Gilles li Muisis, for instance, records how, at the Jubilee of 1300, all the Papal Penitentiaries were in doubt about it, and appealed to the Pope. Boniface VIII. did indeed take the occasion of repeating (in the words of his Bull) that confession and contrition were necessary preliminaries; but he neither repudiated the misleading words nor vouchsafed any clear explanation of them. (*Chron. Aegidii li Muisis* ed. de Smet, p. 189.) His predecessor, Celestine V., had actually used them in a Bull.

The phrase exercised the minds of learned canonists all through the middle ages, but still held its ground. The most accepted modern theory is that it is merely a catchword surviving from a longer phrase which proclaimed how, during such Indulgences, ordinary confessors might absolve from sins usually "reserved" to the Bishop or the Pope. Nobody, however, has ventured exactly to reconstitute this hypothetical phrase; nor is the theory easy to reconcile with (i.) the uncertainty of canonists at the time when the locution was quite recent, (ii.) the fact that Clement V. and Cardinal Cusanus speak of absolution *a poena et a culpa* as a separate thing from (*a*) plenary absolution and (*b*) absolution from "reserved" sins (Clem. lib. v. tit. ix. c. 2, and Johann Busch (d. *c.* 1480) *Chron. Windeshemense*, cap. xxxvi.). But, however it originated, the phrase undoubtedly contributed to foster popular misconceptions as to the intrinsic value of Indulgences, apart from repentance and confession; though Dr Lea seems to press this point unduly (p. 54 ff.), and should be read in conjunction with Thurston (p. 324 ff.).

These misconceptions were certainly widespread from the 13th to the 16th century, and were often fostered by the "pardoners," or professional collectors of contributions for Indulgences. This can best be shown by a few quotations from eminent and orthodox churchmen during those centuries. Berthold of Regensburg (*c.* 1270) says, "Fie, penny-preacher! . . . thou dost promise so much remission of sins for a mere halfpenny or penny, that thousands now trust thereto, and fondly dream to have atoned for all their sins with the halfpenny or penny, and thus go to hell" (ed. Pfeiffer, i. 393).[1] A century later, the author of *Piers Plowman* speaks of pardoners who "give pardon for pence poundmeal about" (*i.e.* wholesale; B. ii. 222); and his contemporary, Pope Boniface IX., complained of their absolving even impenitent sinners for ridiculously small sums (*pro qualibet parva pecuniarum summula*, Raynaldus, *Ann. Ecc.* 1390). In 1450 Thomas Gascoigne, the great Oxford Chancellor, wrote: "Sinners say nowadays 'I care not how many or how great sins I commit before God, for I shall easily and quickly get plenary remission of any guilt and penalty whatsoever (*cujusdam culpae et poenae*) by absolution and indulgence granted to me from the Pope, whose writing and grant I have bought for 4d. or 6d. or for a game of tennis'" —or sometimes, he adds, by a still more disgraceful bargain (*pro actu meretricio*, Lib. Ver. p. 123, cf. 126). In 1523 the princes of Germany protested to the Pope in language almost equally strong (Browne, *Fasciculus*, i. 354). In 1562 the Council of Trent abolished the office of "pardoner."

The greatest of all Plenary Indulgences is of course the Roman

[1] Equally strong assertions were made by the provincial council of Mainz in 1261; and Lea (p. 287) quotes the complaints of 36 similar church councils before 1538.

Jubilee. This was instituted in 1300 by Boniface VIII., who pleaded a popular tradition for its celebration every hundredth year, though no written evidence could be found. Clement VI. shortened the period to 50 years (1350): it was then further reduced to 33, and again in 1475 to 25 years.

See also the article on LUTHER. The latest and fullest authority on this subject is Dr H. C. Lea, *Hist. of Auricular Confession and Indulgences in the Latin Church* (Philadelphia, 1896); his standpoint in frankly non-Catholic, but he gives ample materials for judgment. The greatest orthodox authority is Eusebius Amort, *De Origine, &c., indulgentiarum* (1735). More popular and more easily accessible are Father Thurston's *The Holy Year of Jubilee* (1900), and an article by the Bishop of Newport in the *Nineteenth Century* for January 1901, with a reply by Mr Herbert Paul in the next number. (G. G. Co.)

INDULINES, a series of dyestuffs of blue, bluish-red or black shades, formed by the interaction of para-amino azo compounds with primary monamines in the presence of a small quantity of a mineral acid. They were first discovered in 1863 (English patent 3307) by J. Dale and H. Caro, and since then have been examined by many chemists (see O. N. Witt, *Ber.*, 1884, 17, p. 74; O. Fischer and E. Hepp, *Ann.*, 1890, 256, pp. 233 et seq.; F. Kehrmann, *Ber.*, 1891, 24, pp. 584, 2167 et seq.). They are derivatives of the eurhodines (aminophenazines, aminonaphthophenazines), and by means of their diazo derivatives can be de-amidated, yielding in this way azonium salts; consequently they may be considered as amidated azonium salts. The first reaction giving a clue to their constitution was the isolation of the intermediate *azophenin* by O. Witt (*Jour. Chem. Soc.*, 1883, 43, p. 115), which was proved by Fischer and Hepp to be dianilidoquinone dianil, a similar intermediate compound being found shortly afterwards in the naphthalene series. *Azophenin*, $C_{30}H_{24}N_4$, is prepared by warming quinone dianil with aniline; by melting together quinone, aniline and aniline hydrochloride; or by the action of aniline on para-nitrosophenol or para-nitrosodiphenylamine. The indulines are prepared as mentioned above from aminoazo compounds:

$$NH_2\cdot C_6H_4N_2\cdot C_6H_5 + C_6H_5NH_2 \rightarrow HN{:}C_6H_3 \Big\langle \begin{matrix} N\text{———} \\ N\cdot C_6H_5 \end{matrix} \Big\rangle C_6H_4,$$

(aposafranine)

or by condensing oxy- and amido-quinones with phenylated ortho-diamines (F. Kehrmann, *Ber.*, 1895, 28, p. 1714):

$$\begin{matrix} HO \\ O \end{matrix} \Big\rangle C_6H_2 \Big\langle \begin{matrix} O \\ OH \end{matrix} + \begin{matrix} H_2N \\ C_6H_5NH \end{matrix} \Big\rangle C_6H_4 =$$

$$2H_2O + \begin{matrix} O \\ HO \end{matrix} \Big\rangle C_6H_2 \Big\langle \begin{matrix} N\cdot C_6H_5 \\ N\text{———} \end{matrix} \Big\rangle C_6H_4.$$

The indulines may be subdivided into the following groups:—(1) benzindulines, derivatives of phenazine; (2) isorosindulines; and (3) rosindulines, both derived from naphthophenazine; and (4) naphthindulines, derived from naphthazine.

$$NH{:}C_6H_3 \Big\langle \begin{matrix} N\text{———} \\ N\cdot C_6H_5 \end{matrix} \Big\rangle C_6H_4 \qquad NH{:}C_6H_3 \Big\langle \begin{matrix} N\text{———} \\ N\cdot C_6H_5 \end{matrix} \Big\rangle C_{10}H_6$$

I. Benzindulines. II. Isorosindulines.

$$NH{:}C_{10}H_5 \Big\langle \begin{matrix} N\text{———} \\ N\cdot C_6H_6 \end{matrix} \Big\rangle C_6H_4 \qquad NH{:}C_{10}H_5 \Big\langle \begin{matrix} N\text{———} \\ N\cdot C_6H_6 \end{matrix} \Big\rangle C_{10}H_6$$

III. Rosindulines. IV. Naphthindulines.

The rosindulines and naphthindulines have a strongly basic character, and their salts possess a marked red colour and fluorescence. *Benzinduline* (aposafranine), $C_{18}H_{13}N_3$, is a strong base, but cannot be diazotized, unless it be dissolved in concentrated mineral acids. When warmed with aniline it yields anilido-aposafranine, which may also be obtained by the direct oxidation of ortho-aminodiphenylamine. *Isorosinduline* is obtained from quinone dichlorimide and phenyl-β-naphthylamine; *rosinduline* from benzene-azo-α-naphthylamine and aniline and *naphthinduline* from benzene-azo-α-naphthylamine and naphthylamine.

INDULT (Lat. *indultum*, from *indulgere*, grant, concede, allow), a papal licence which authorizes the doing of something not sanctioned by the common law of the church; thus by an indult the pope authorizes a bishop to grant certain relaxations during the Lenten fast according to the necessities of the situation, climate, &c., of his diocese.

INDUNA, a Zulu-Bantu word for an officer or head of a regiment among the Kaffir (Zulu-Xosa) tribes of South Africa. It is formed from the inflexional prefix *in* and *duna*, a lord or master. Indunas originally obtained and retained their rank and authority by personal bravery and skill in war, and often proved a menace to their nominal lord. Where, under British influence, the purely military system of government among the Kaffir tribes has broken down or been modified, indunas are now administrators rather than warriors. They sit in a consultative gathering known as an indaba, and discuss the civil and military affairs of their tribe.

INDUS, one of the three greatest rivers of northern India.

In the Himalaya.

A considerable accession of exact geographical knowledge has been gained of the upper reaches of the river Indus and its tributaries during those military and political movements which have been so constant on the northern frontiers of India of recent years. The sources of the Indus are to be traced to the glaciers of the great Kailas group of peaks in 32° 20′ N. and 81° E., which overlook the Mansarowar lake and the sources of the Brahmaputra, the Sutlej and the Gogra to the south-east. Three great affluents, flowing north-west, unite in about 80° E. to form the main stream, all of them, so far as we know at present, derived from the Kailas glaciers. Of these the northern tributary points the road from Ladakh to the Jhalung goldfields, and the southern, or Gar, forms a link in the great Janglam—the Tibetan trade route—which connects Ladakh with Lhasa and Lhasa with China. Gartok (about 50 m. from the source of this southern head of the Indus) is an important point on this trade route, and is now made accessible to Indian traders by treaty with Tibet and China. At Leh, the Ladakh capital, the river has already pursued an almost even north-westerly course for 300 m., except for a remarkable divergence to the south-west which carries it across, or through, the Ladakh range to follow the same course on the southern side that had been maintained on the north. This very remarkable instance of transverse drainage across a main mountain axis occurs in 79° E., about 100 m. above Leh. For another 230 m., in a north-westerly direction, the Indus pursues a comparatively gentle and placid course over its sandy bed between the giant chains of Ladakh to the north and Zaskar (the main "snowy range" of the Himalaya) to the south, amidst an array of mountain scenery which, for the majesty of sheer altitude, is unmatched by any in the world. Then the river takes up the waters of the Shyok from the north (a tributary nearly as great as itself), having already captured the Zasvar from the south, together with innumerable minor glacier-fed streams.

The Shyok affluent.

The Shyok is an important feature in Trans-Himalayan hydrography. Rising near the southern foot of the well-known Karakoram pass on the high road between Ladakh and Kashgar, it first drains the southern slopes of the Karakoram range, and then breaks across the axis of the Muztagh chain (of which the Karakoram is now recognized as a subsidiary extension northwards) ere bending north-westwards to run a parallel course to the Indus for 150 m. before its junction with that river. The combined streams still hold on their north-westerly trend for another 100 m., deep hidden under the shadow of a vast array of snow-crowned summits, until they arrive within sight of the Rakapushi peak which pierces the north-western sky midway between Gilgit and Hunza. Here the great change of direction to the south-west occurs, which is thereafter maintained till the Indus reaches the ocean.

The Gilgit affluent.

At this point it receives the Gilgit river from the north-west, having dropped from 15,000 to 4000 ft. (at the junction of the rivers) after about 500 m. of mountain descent through the independent provinces of northern Kashmir. (See GILGIT.) A few miles below the junction it passes Bunji, and from that point to a point beyond Chilas (50 m. below Bunji) it runs within the sphere of British interests. Then once again it resumes its "independent" course through the wild mountains of Kohistan and Hazara, receiving tribute from both sides (the Buner contribution being the most noteworthy) till it emerges into the plains of the Punjab below Darband, in 34° 10′ N. All this part of the river has been mapped in more or less detail of late years. The hidden strongholds of those Hindostani fanatics who had found a refuge on its banks since

Mutiny days have been swept clean, and many ancient mysteries have been solved in the course of its surveying.

Indus of the plains. From its entrance into the plains of India to its disappearance in the Indian Ocean, the Indus of to-day is the Indus of the 'fifties—modified only in some interesting particulars. It has been bridged at several important points. There are bridges even in its upper mountain courses. There is a wooden pier bridge at Leh of two spans, and there are native suspension bridges of cane or twig-made rope swaying uneasily across the stream at many points intervening between Leh and Bunji; but the first English-made iron suspension bridge is a little above Bunji, linking up the highroad between Kashmir and Gilgit. Next occurs the iron girder railway bridge at Attock, connecting Rawalpindi with Peshawar, at which point the river narrows almost to a gorge, only 900 ft. above sea-level. Twenty miles below Attock the river has carved out a central trough which is believed to be 180 ft. deep. Forty miles below Attock another great bridge has been constructed at Kushalgarh, which carries the railway to Kohat and the Kurram valley. At Mari, beyond the series of gorges which continue from Kushalgarh to the borders of the Kohat district, on the Sind-Sagar line, a boat-bridge leads to Kalabagh (the Salt city) and northwards to Kohat. Another boat-bridge opposite Dera Ismail Khan connects that place with the railway; but there is nothing new in these southern sections of the Indus valley railway system except the extraordinary development of cultivation in their immediate neighbourhood. The Lansdowne bridge at Sukkur, whose huge cantilevers stand up as a monument of British enterprise visible over the flat plains for many miles around, is one of the greatest triumphs of Indian bridge-making. Kotri has recently been connected with Hyderabad in Sind, and the Indus is now one of the best-bridged rivers in India. The intermittent navigation which was maintained by the survivals of the Indus flotilla as far north as Dera Ismail Khan long after the establishment of the railway system has ceased to exist with the dissolution of the fleet, and the high-sterned flat Indus boats once again have the channels and sandbanks of the river all to themselves.

Lower Indus and delta. Within the limits of Sind the vagaries of the Indus channels have necessitated a fresh survey of the entire riverain. The results, however, indicate not so much a marked departure in the general course of the river as a great variation in the channel beds within what may be termed its outside banks. Collaterally much new information has been obtained about the ancient beds of the river, the sites of ancient cities and the extraordinary developments of the Indus delta. The changing channels of the main stream since those prehistoric days when a branch of it found its way to the Runn of Cutch, through successive stages of its gradual shift westwards—a process of displacement which marked the disappearance of many populous places which were more or less dependent on the river for their water supply—to the last and greatest change of all, when the stream burst its way through the limestone ridges of Sukkur and assumed a course which has been fairly constant for 150 years, have all been traced out with systematic care by modern surveyors till the medieval history of the great river has been fully gathered from the characters written on the delta surface. That such changes of river bed and channel should have occurred within a comparatively limited period of time is the less astonishing if we remember that the Indus, like many of the greatest rivers of the world, carries down sufficient detritus to raise its own bed above the general level of the surrounding plains in an appreciable and measurable degree. At the present time the bed of the Indus is stated to be 70 ft. above the plains of the Sind frontier, some 50 m. to the west of it.

Statistics. The total length of the Indus, measured directly, is about 1500 m. With its many curves and windings it stretches to about 2000 m., the area of its basin being computed at 372,000 sq. m. Even at its lowest in winter it is 500 ft. wide at Iskardo (near the Gilgit junction) and 9 or 10 ft. deep. The temperature of the surface water during the cold season in the plains is found to be 5° below that of the air (64° and 69° F.). At the beginning of the hot season, when the river is bringing down snow water, the difference is 14° (87° and 101° June). At greater depths the difference is still greater. At Attock, where the river narrows between rocky banks, a height of 50 ft. in the flood season above lowest level is common, with a velocity of 13 m. per hour. The record rise (since British occupation of the Punjab) is 80 ft. At its junction with the Panjnad (the combined rivers of the Punjab east of the Indus) the Panjnad is twice the width of the Indus, but its mean depth is less, and its velocity little more than one-third. This discharge of the Panjnad at low season is 69,000 cubic ft. per second, that of the Indus 92,000. Below the junction the united discharge in flood season is 380,000 cubic ft., rising to 460,000 (the record in August). The Indus after receiving the other rivers carries down into Sind, in the high flood season, turbid water containing silt to the amount of $\frac{1}{230}$ part by weight, or $\frac{1}{410}$ by volume—equal to 6480 millions of cubic ft. in the three months of flood. This is rather less than the Ganges carries. The silt is very fine sand and clay. Unusual floods, owing to landslips or other exceptional causes, are not infrequent. The most disastrous flood of this nature occurred in 1858. It was then that the river rose 80 ft. at Attock. The most striking result of the rise was the reversal of the current of the Kabul river, which flowed backwards at the rate of 10 m. per hour, flooding Nowshera and causing immense damage to property. The prosperity of the province of Sind depends almost entirely on the waters of the Indus, as its various systems of canals command over nine million acres out of a cultivable area of twelve and a half million acres.

See Maclagan, *Proceedings R.G.S.*, vol. iii.; Haig, *The Indus Delta Country* (London, 1894); Godwin-Austen, *Proceedings R.G.S.*, vol. vi. (T. H. H.*)

INDUSTRIA (mod. Monteù da Po), an ancient town of Liguria, 20 m. N.E. of Augusta Taurinorum. Its original name was Bodincomagus, from the Ligurian name of the Padus (mod. Po), Bodincus, *i.e.* bottomless (Plin. *Hist. Nat.* iii. 122), and this still appears on inscriptions of the early imperial period. It stood on the right bank of the river, which has now changed its course over 1 m. to the north. It was a flourishing town, with municipal rights, as excavations (which have brought to light the forum, theatre, baths, &c.) have shown, but appears to have been deserted in the 4th century A.D.

See A. Fabietti in *Atti della Società di Archeologia di Torino*, iii. 17 seq.; Th. Mommsen in *Corp. Inscrip. Lat.* v. (Berlin, 1877), p. 845; E. Ferrero in *Notizie degli Scavi* (1903), p. 43.

INDUSTRIAL SCHOOL, in England a school, generally established by voluntary contributions, for the industrial training of children, in which children are lodged, clothed and fed, as well as taught. Industrial schools are chiefly for vagrant and neglected children and children not convicted of theft. Such schools are for children up to the age of fourteen, and the limit of detention is sixteen. They are regulated by the Children Act 1908, which repealed the Industrial Schools Act 1866, as amended by Acts of 1872, 1891 and 1901, and parallel legislation in the various Elementary Education Acts, besides some few local acts. The home secretary exercises powers of supervision, &c. See JUVENILE OFFENDERS.

INDUSTRY (Lat. *industria*, from *indu-*, a form of the preposition *in*, and either *stare*, to stand, or *struere*, to pile up), the quality of steady application to work, diligence; hence employment in some particular form of productive work, especially of manufacture; or a particular class of productive work itself, a trade or manufacture. See LABOUR LEGISLATION, &c.

INE, king of the West Saxons, succeeded Ceadwalla in 688, his title to the crown being derived from Ceawlin. In the earlier part of his reign he was at war with Kent, but peace was made in 694, when the men of Kent gave compensation for the death of Mul, brother of Ceadwalla, whom they had burned in 687. In 710 Ine was fighting in alliance with his kinsman Nun, probably king of Sussex, against Gerent of West Wales and, according to Florence of Worcester, he was victorious. In 715 he fought a battle with Ceolred, king of Mercia, at Woodborough in Wiltshire, but the result is not recorded. Shortly after this time a quarrel seems to have arisen in the royal family. In 721 Ine slew Cynewulf, and in 722 his queen Aethelburg destroyed Taunton, which her husband had built earlier in his reign. In 722 the South Saxons, previously subject to Ine, rose against him under the exile Aldbryht, who may have been a member of the West Saxon royal house. In 725 Ine fought with the South Saxons and slew Aldbryht. In 726 he resigned the crown and went to Rome, being succeeded by Aethelheard in Wessex. Ine is said to have built the minster at Glastonbury. The date of his death is not recorded. He issued a written code of laws for Wessex, which is still preserved.

See Bede, *Hist. Eccl.* (Plummer), iv. 15, v. 7; *Saxon Chronicle* (Earle and Plummer), s.a. 688e, 694, 710, 715, 721, 722, 725, 728; Thorpe, *Ancient Laws*, i. 2-25; Schmid, *Gesetze der Angelsachsen* (Leipzig, 1858); Liebermann, *Gesetze der Angelsachsen* (Halle, 1898–99).

INEBOLI, a town on the north coast of Asia Minor, 70 m. W. of Sinūb (Sinope). It is the first place of importance touched at by mercantile vessels plying eastwards from Constantinople, being the port for the districts of Changra and Kastamuni, and connected with the latter town by a carriage road (see KASTAMUNI). The roadstead is exposed, having no protection for shipping except a jetty 300 ft. long, so that in rough weather landing is impracticable. The exports (chiefly wool and mohair) are about £248,000 annually and the imports £200,000. The population is about 9000 (Moslems 7000, Christians 2000). Ineboli represents the ancient *Abonou-teichos*, famous as the birthplace of the false prophet Alexander, who established there (2nd century A.D.) an oracle of the snake-God Glycon-Asclepius. This impostor, immortalized by Lucian, obtained leave from the emperor Marcus Aurelius to change the name of the town to *Ionopolis*, whence the modern name is derived (see ALEXANDER THE PAPHLAGONIAN).

INEBRIETY, LAW OF. The legal relations to which inebriety (Lat. *in*, intensive, and *ebrietas*, drunkenness) gives rise are partly civil and partly criminal.

I. *Civil Capacity.*—The law of England as to the civil capacity of the drunkard is practically identified with, and has passed through substantially the same stages of development as the law in regard to the civil capacity of a person suffering from mental disease (see INSANITY). Unless (see III. *inf.*) a modification is effected in his condition by the fact that he has been brought under some form of legal control, a man may, in spite of intoxication, enter into a valid marriage or make a valid will, or bind himself by a contract, if he is sober enough to know what he is doing, and no improper advantage of his condition is taken (cf. *Matthews* v. *Baxter*, 1873, L.R. 8 Ex. 132; *Imperial Loan Co.* v. *Stone*, 1892, 1 Q.B. 599). The law is the same in Scotland and in Ireland; and the Sale of Goods Act 1893 (which applies to the whole United Kingdom) provides that where necessaries are sold and delivered to a person who by reason of drunkenness is incompetent to contract, he must pay a reasonable price for them; "necessaries" for the purposes of this provision mean goods suitable to the condition in life of such person and to his actual requirements at the time of the sale and delivery.

Under the Roman law, and under the Roman Dutch law as applied in South Africa, drunkenness, like insanity, appears to vitiate absolutely a contract made by a person under its influence (*Molyneux* v. *Natal Land and Colonization Co.*, 1905, A.C. 555).

In the United States, as in England, intoxication does not vitiate contractual capacity unless it is of such a degree as to prevent the person labouring under it from understanding the nature of the transaction into which he is entering (Bouvier, *Law Dict.*, s.v. "Drunkenness"; and cf. *Waldron* v. *Angleman*, 1904, 58 Atl. 568; *Fowler* v. *Meadow Brook Water Co.*, 1904, 57 Atl. 959; 208 Penn., 473). The same rule is by implication adopted in the Indian Contract Act (Act ix. of 1872), which provides (s. 12) that "a person is . . . of sound mind for the purpose of making a contract if, at the time when he makes it, he is capable of understanding it and of forming a rational judgment as to its effect upon his interests." In some legal systems, however, habitual drunkenness is a ground for divorce or judicial separation (Sweden, Law of the 27th of April 1810; France, Code Civil, Art. 231, *Hirt* v. *Hirt*, Dalloz, 1898, pt. ii., p. 4, and n. 4).

II. *Criminal Responsibility.*—In English law, drunkenness, unlike insanity, was at one time regarded as in no way an excuse for crime. According to Coke (Co. Litt., 247) a drunkard, although he suffers from acquired insanity, *dementia affectata*, is *voluntarius daemon*, and therefore has no privilege in consequence of his state; "but what hurt or ill soever he doth, his drunkenness doth aggravate it." Sir Matthew Hale (P.C. 32) took a more moderate view, viz. that a person under the influence of this voluntarily contracted madness "shall have the same judgment as if he were in his right senses"; and admitted the existence of two "allays" or qualifying circumstances: (1) *temporary* frenzy induced by the unskilfulness of physicians or by drugging; and (2) *habitual* or fixed frenzy. Those early authorities have, however, undergone considerable development and modification.

Although the general principle that drunkenness is not an excuse for crime is still steadily maintained (see Russell, *Crimes*, 6th ed., i. 144; Archbold, *Cr. Pl.*, 23rd ed., p. 29), it is settled law that where a particular intent is one of the constituent elements of an offence, the fact that a prisoner was intoxicated at the time of its commission is relevant evidence to show that he had not the capacity to form that intent. Drunkenness is also a circumstance of which a jury may take account in considering whether an act was premeditated, or whether a prisoner acted in self-defence or under provocation, when the question is whether the danger apprehended or the provocation was sufficient to justify his conduct or to alter its legal character. Moreover, *delirium tremens*, if it produce such a degree of madness as to render a person incapable of distinguishing right from wrong, relieves him from criminal responsibility for any act committed by him while under its influence; and in one case at *nisi prius* (*R.* v *Baines*, *The Times*, 25th Jan. 1886) this doctrine was extended by Mr Justice Day to temporary derangement occasioned by drink. The law of Scotland accepts, if it does not go somewhat beyond, the later developments of that of England in regard to criminal responsibility in drunkenness. Indian law on the point is similar to the English (Indian Penal Code, Act. xlv. of 1860, ss. 85, 86; Mayne, *Crim. Law of India*, ed. 1896, p. 391). In the United States the same view is the prevalent legal doctrine (see Bishop, *Crim. Law*, 8th ed., i. ss. 397-416). The Criminal Code of Queensland (No. 9 of 1899, Art. 28) provides that a person who becomes intoxicated intentionally is responsible for any crime that he commits while so intoxicated, whether his voluntary intoxication was induced so as to afford an excuse for the commission of an offence or not. As in England, however, when an intention to cause a specific result is an element of an offence, intoxication, whether complete or partial, and whether intentional or unintentional, may be regarded for the purpose of ascertaining whether such intention existed or not. There is a similar provision in the Penal Code of Ceylon (No. 2 of 1883, Art. 79). The Criminal Codes of Canada (1892, c. 29, ss. 7 et seq.) and New Zealand (No. 56 of 1893, ss. 21 et seq.) are silent on the subject of intoxication as an excuse for crime. The Criminal Code of Grenada (No. 2 of 1897, Art. 51) provides that "a person shall not, on the ground of intoxication, be deemed to have done any act involuntarily, or be exempt from any liability to punishment for any act: and a person who does an act while in a state of intoxication shall be deemed to have intended the natural and probable consequences of his act." There is a similar provision in the Criminal Code of the Gold Coast Colony (No. 12 of 1892, s. 54). Under the French Penal Code (Art. 64), *il n'y a ni crime, ni délit, lorsque le prévenu était en état de démence au temps de l'action ou lorsqu'il aura été contraint par une force à laquelle il n' a pu résister.*" According to the balance of authority (Dalloz, *Rép.* tit., Peine, ss. 402 et seq.) intoxication is not assimilated to insanity, within the meaning of this article, but it may be and is taken account of by juries as an extenuating circumstance (Ortolan, *Droit Pénal* i. s. 323: Chauveau et Hélie i. s. 360). A provision in the German Penal Code (Art. 51) that an act is not punishable if its author, at the time of committing it, was in a condition of unconsciousness, or morbid disturbance of the activity of his mind which prevented the free exercise of his will, has been held not to extend to intoxication (Clunet, 1883, p. 311). But in Germany as in France, intoxication may apparently be an extenuating circumstance.

Under the Italian Penal Code (Arts. 46-49) intoxication—unless voluntarily induced so as to afford an excuse for crime—may exclude or modify responsibility.

So far only the question whether drunkenness is an excuse for offences committed under its influence has been dealt with. There remains the question how far drunkenness itself is a crime. Mere private intoxication is not, either in England or in the United States (Bishop, *Crim. Law*, 8th ed., i. s. 399) indictable as an offence at common law; but in all civilized countries public drunkenness is punishable when it amounts to a breach of the peace (see LIQUOR LAWS) or contravention of public order; and modern legislation in many countries provides for deprivation of personal liberty for long periods in case of a frequent repetition of the offence. Reference may be made in this connexion to the Inebriates Acts 1898, 1899 and 1900 (see iii. *inf.*), and also to similar legislation in the British colonies and in foreign legal systems (*e.g.* Cape of Good Hope, No. 32 of 1896; Ceylon, Licensing Ordinance 1891, ss. 23, 24, 29; New South Wales, Vagrants Punishment Act 1866; Massachusetts, Acts of 1891, c. 427, 1893, cc. 414, 44; France, Law of 23rd of Jan. 1873, Art. 6).

III. *State Action in Regard to Inebriety.*—This assumes a variety of forms. (*a*) Measures regulating the punishment of occasional or habitual drunkenness by fines or short terms of imprisonment. (*b*) Control in *penal* establishments for lengthened periods. (*c*) Laws prohibiting the sale of liquor to persons who are known inebriates: *e.g.* in England (Licensing Act 1902); Ontario (Rev. Stats. 1897, c. 245, ss. 124, 125); New South Wales (Liquor Act 1898, ss. 52, 53); Cape of Good Hope (No. 28 of 1883, s. 89); New York (Rev. Stats. 1889–1892, c. 20, Title iv.); California (Act to prevent sale of liquor to drunkards, 1889); Massachusetts (Pub. Stats., ed. 1902, c. 100, s. 9). (*d*) Laws regulating the appointment of some person or persons to act as guardian or guardians, or who may be endowed with legal powers over the person and estate of an inebriate. Thus in France (Code Civil, Arts. 489 et seq.), Germany (Civil Code, Art. 6 (39)) and Austria-Hungary (*Bürgerliches Gesetz-Buch*, ss. 21, 269, 270, 273), an inebriate may be judicially interdicted if he is squandering his property and thereby exposing his family to future destitution. Provision is also made for the interdiction of inebriates by the laws of Nova Scotia (Rev. Stats. 1900, c. 126, s. 2), Manitoba (Rev. Stat. 1902, c. 103, ss. 30 et seq.), British Columbia (Rev. Stat. 1897, c. 66), New South Wales (Inebriates Act 1900, s. 5), Tasmania (Inebriates Act 1885, No. 17, s. 23); Canton of Bâle (Trustee Law of the 23rd of Feb. 1880, s. 11), Orange River Colony (Code Laws, c. 108, s. 30), Maryland (Code General Laws, c. 474, s. 47). (*e*) Control for the purpose of reformation. Legislation of this character provides reformatory treatment: (1) for the inebriate who makes a voluntary application for admission; (2) by compulsory seclusion for the inebriate who refuses consent to treatment and yet manages to keep out of the reach of the law; (3) for the inebriate who is a police-court recidivist, or who has committed crime, caused or contributed to by drink. The legislation of the Cape of Good Hope (Inebriates Act 1896) and of North Dakota (Habitual Drunkards Act 1895) provides for the first of these methods of treatment alone. Compulsory detention for ordinary inebriates only is provided for by the laws of Delaware (Act of 1898), Massachusetts (Rev. Laws, c. 87), and of the Cantons of Berne (Law of the 24th of Nov. 1883) and Bâle (Law of the 21st of Feb. 1901). All three methods of treatment are in force in New South Wales (Inebriates Act 1900), Queensland (Inebriates Institutions Act 1896) and South Australia (Inebriates Act 1881). Provision is made only for voluntary application and compulsory detention of ordinary inebriates in Victoria (Inebriates Act 1890), Tasmania (Inebriates Act 1885; Inebriates Hospitals Act 1892) and New Zealand (Inebriates Institutions Act 1898). The legislation of the United Kingdom (Inebriates Acts 1879–1900) deals both with voluntary application and with the committal of criminal inebriates or of police-court recidivists. A brief sketch of the English system must suffice.

The Inebriates Acts of 1879–1900 deal in the first place with non-criminal, and in the second place with criminal, habitual drunkards.

For the purposes of the acts the term "habitual drunkard" means "a person who, not being amenable to any jurisdiction in lunacy, is notwithstanding, by reason of habitual intemperate drinking of intoxicating liquor, at times dangerous to himself or herself, or incapable of managing himself or herself and his or her affairs." A person would become amenable to the lunacy jurisdiction not only where habitual drunkenness made him a "lunatic" in the legal sense of the term, but where it created such a state of disease and consequential "mental infirmity" as to bring his case within section 116 of the Lunacy Act 1890, the effect of which is explained in the article INSANITY. Any "habitual drunkard" within the above definition may obtain admission to a "licensed retreat" on a written application to the licensee, stating the time (the maximum period is two years) that he undertakes to remain in the retreat. The application must be accompanied by the statutory declaration of two persons that the applicant is an habitual drunkard, and its signature must be attested by a justice of the peace who has satisfied himself as to the fact, and who is required to state that the applicant understood the nature and effect of his application. Licences (each of which is subject to a duty and is impressed with a stamp of £5, and 10s. for every patient above ten in number) are granted for retreats by the borough council and the town clerk in boroughs, and elsewhere by the county council and the clerk of the county council. The maximum period for which a licence may be granted is two years, but licences may be renewed by the licensing authority on payment of a stamp duty of the same amount as on the original grant. When an habitual drunkard has once been committed to a retreat, he must remain in the retreat for the time that he has fixed in his application, subject to certain statutory provisions similar to those prescribed by the Lunacy Acts for asylums as to leave of absence and discharge; and he may be retaken and brought back to the retreat under a justice's warrant. The term of detention may be extended on its expiry, or an inebriate may be readmitted, on a fresh application, without any statutory declaration, and without the attesting justice being required to satisfy himself that the applicant is an habitual drunkard. Licensed retreats are subject to inspection by an Inspector of Retreats appointed by the Home Secretary, to whom he makes an annual report. The Home Secretary is empowered to make rules and regulations for the management of retreats, and "regulations and orders," not inconsistent with such rules, are to be prepared by the licensee within a month after the granting of his licence, and submitted to the inspector for approval. The rules now in force are dated as regards (*a*) England, 28th Feb. 1902; (*b*) Scotland, 14th April 1902; (*c*) Ireland, 3rd Feb. 1903. There are also statutory provisions, similar to those of the Lunacy Acts, as to offences—(i.) by licensees failing to comply with the requirements of the acts; (ii) by persons ill-treating patients, or helping them to escape, or unlawfully supplying them with intoxicating liquor; (iii.) by patients refusing to comply with the rules. The Home Secretary may (i.) authorize the establishment of "State Inebriate Reformatories," to be paid for out of moneys provided by parliament; and (ii.) sanction "Certified Inebriates' Reformatories" on the application of any borough or county council, or any person whatever, if satisfied concerning the reformatory and the persons proposing to maintain it. An Inspector of Certified Inebriate Reformatories has been appointed. Regulations for State Inebriate Reformatories and for Certified Inebriate Reformatories have been made, dated as follows: *State Inebriate Reformatories*:—England, 21st of June 1901, 29th of Dec. 1903, 29th of April 1904; Scotland, 9th of March 1900; Ireland, 16th of March 1899, 16th of April 1901, 10th of Feb. 1904. *Certified Inebriate Reformatories*:—England, Model Regulations, 17th of Dec. 1898; Scotland, Regulations, 14th of Feb. 1899; Ireland, Model Regulations, 29th of April 1899.

Any person convicted on indictment of an offence punishable with imprisonment or penal servitude (*i.e.* of any non-capital felony and of most misdemeanours), if the court is satisfied from the evidence that the offence was committed under the influence of drink, or that drink was a contributing cause of the offence, may, if he admits that he is, or is found by the jury to be, an habitual drunkard, in addition to or in substitution for any other sentence, be ordered to be detained in a state or certified inebriate reformatory, the managers of which are willing to receive him. Again, any habitual drunkard who is found drunk in any public place, or who commits any other of a series of similar offences under various statutes, after having within twelve months been convicted at least three times of a similar offence, may, on conviction on indictment, or, if he consent, on summary conviction, be sent for detention in any certified inebriate reformatory. The expenses of prosecuting habitual drunkards under the above provisions are payable out of the local rates upon an order to that effect by the judge of assize or chairman of quarter-sessions if the prosecution be on indictment, or by a court of summary jurisdiction if the offence is dealt with summarily.

Authorities.—As to the history of legislation on the subject see Parl. Paper No. 242 of 1872; 1893 C. 7008. See also Wyatt Paine, *Inebriate Reformatories and Retreats* (London, 1899); Blackwell, *Inebriates Acts, 1879–1898* (London, 1899); Wood Renton, *Lunacy* (London and Edinburgh, 1896); Kerr, *Inebriety* (3rd ed., London, 1894). An excellent account of the systems in force in other countries for the treatment of inebriates will be found in Parl. Pap. (1902), cd. 1474. (A. W. R.)

INFALLIBILITY (Fr. *infaillibilité* and *infallibilité*, the latter now obsolete, Med. Lat. *infallibilitas*, *infallibilis*, formed from *fallor*, to make a mistake), the fact or quality of not being liable to err or fail. The word has thus the general sense of "certainty"; we may, *e.g.*, speak of a drug as an infallible specific, or of a man's judgment as infallible. In these cases, however, the "infallibility" connotes certainty only in so far as anything human can be certain. In the language of the Christian Church the word "infallibility" is used in a more absolute sense, as the freedom from all possibility of error guaranteed by the direct action of the Spirit of God. This belief in the infallibility of revelation is involved in the very beliefs in revelation itself, and is common to all sections of Christians, who differ mainly as to the kind and measure of infallibility residing in the human instruments by which this revelation is interpreted to the world. Some see the guarantee, or at least the indication, of infallibility in the consensus of the Church (*quod semper, ubique, et ab omnibus*) expressed from time to time in general councils; others see it in the special grace conferred upon St Peter and his successors, the bishops of Rome, as heads of the Church; others again see it in the inspired Scriptures, God's Word. This last was the belief of the Protestant Reformers, for whom the Bible was in matters of doctrine the ultimate court of appeal. To the translation and interpretation of the Scriptures men might bring a fallible judgment, but this would be assisted by the direct action of the Spirit of God in proportion to their faith. As for infallibility, this was a direct grace of God, given only to the few. "What ever was perfect under the sun," ask the translators of the Authorized Version (1611) in their preface, "where apostles and apostolick men, that is, men endued with an extraordinary measure of God's Spirit, and privileged with the privilege of infallibility, had not their hand?" In modern Protestantism, on the other hand, the idea of an infallible authority whether in the Church or the Bible has tended to disappear, religious truths being conceived as valuable only as they are apprehended and made real to the individual mind and soul by the grace of God, not by reason of any submission to an external authority. (See also Inspiration.)

At the present time, then, the idea of infallibility in religious matters is most commonly associated with the claim of the Roman Catholic Church, and more especially of the pope personally as head of that Church, to possess the privilege of infallibility, and it is with the meaning and limits of this claim that the present article deals.

The substance of the claim to infallibility made by the Roman Catholic Church is that the Church and the pope cannot err when solemnly enunciating, as binding on all the faithful, a decision on a question of faith or morals. The infallibility of the Church, thus limited, is a necessary outcome of the fundamental conception of the Catholic Church and its mission. Every society of men must have a supreme authority, whether individual or collective, empowered to give a final decision in the controversies which concern it. A community whose mission it is to teach religious truth, which involves on the part of its members the obligation of belief in this truth, must, if it is not to fail of its object, possess an authority capable of maintaining the faith in its purity, and consequently capable of keeping it free from and condemning errors. To perform this function without fear of error, this authority must be infallible in its own sphere. The Christian Church has expressly claimed this infallibility for its formal dogmatic teaching. In the very earliest centuries we find the episcopate, united in council, drawing up symbols of faith, which every believer was bound to accept under pain of exclusion, condemning heresies, and casting out heretics. From Nicaea and Chalcedon to Florence and Trent, and to the present day, the Church has excluded from her communion all those who do not profess her own faith, *i.e.* all the religious truths which she represents and imposes as obligatory. This is infallibility put into practice by definite acts.

The infallibility of the pope was not defined until 1870 at the Vatican Council; this definition does not constitute, strictly speaking, a dogmatic innovation, as if the pope had not hitherto enjoyed this privilege, or as if the Church, as a whole, had admitted the contrary; it is the newly formulated definition of a dogma which, like all those defined by the Councils, continued to grow into an ever more definite form, ripening, as it were, in the always living community of the Church. The exact formula for the papal infallibility is given by the Vatican Council in the following terms (Constit. *Pastor aeternus*, cap. iv.); "we teach and define as a divinely revealed dogma, that the Roman Pontiff, when he speaks *ex cathedra*—*i.e.* when, in his character as Pastor and Doctor of all Christians, and in virtue of his supreme apostolic authority, he lays down that a certain doctrine concerning faith or morals is binding upon the universal Church,—possesses, by the Divine assistance which was promised to him in the person of the blessed Saint Peter, that same infallibility with which the Divine Redeemer thought fit to endow His Church, to define its doctrine with regard to faith and morals; and, consequently, that these definitions of the Roman Pontiff are irreformable in themselves, and not in consequence of the consent of the Church." A few notes will suffice to elucidate this pronouncement.

(*a*) As the Council expressly says, the infallibility of the pope is not other than that of the Church; this is a point which is too often forgotten or misunderstood. The pope enjoys it in person, but solely *qua* head of the Church, and as the authorized organ of the ecclesiastical body. For this exercise of the primacy as for the others, we must conceive of the pope and the episcopate united to him as a continuation of the Apostolic College and its head Peter. The head of the College possesses and exercises by himself alone the same powers as the College which is united with him; not by delegation from his colleagues, but because he is their established chief. The pope when teaching *ex cathedra* acts as head of the whole episcopal body and of the whole Church.

(*b*) If the Divine constitution of the Church has not changed in its essential points since our Lord, the mode of exercise of the various powers of its head has varied; and that of the supreme teaching power as of the others. This explains the late date at which the dogma was defined, and the assertion that the dogma was already contained in that of the papal primacy established by our Lord himself in the person of St Peter. A certain dogmatic development is not denied, nor an evolution in the direction of a centralization in the hands of the pope of the exercise of his powers as primate; it is merely required that this evolution should be well understood and considered as legitimate.

(*c*) As a matter of fact the infallibility of the pope, when giving decisions in his character as head of the Church, was generally admitted before the Vatican Council. The only reservation which the most advanced Gallicans dared to formulate, in the terms of the celebrated declaration of the clergy of France (1682), had as its object the irreformable character of the pontifical definitions, which, it was claimed, could only have been acquired by them through the assent of the Church. This doctrine, rather political than theological, was a survival of the errors which had come into being after the Great Schism, and especially at the council of Constance; its object was to put the Church above its head, as the council of Constance had put the ecumenical council above the pope, as though the council could be ecumenical without its head. In reality it was Gallicanism alone which was condemned at the Vatican Council, and it is Gallicanism which is aimed at in the last phrase of the definition we have quoted.

(*d*) Infallibility is the guarantee against error, not in all matters, but only in the matter of dogma and morality; everything else is beyond its power, not only truths of another order, but even discipline and the ecclesiastical laws, government and administration, &c.

(*e*) Again, not all dogmatic teachings of the pope are under the guarantee of infallibility; neither his opinions as private instructor, nor his official allocutions, however authoritative they may be, are infallible; it is only his *ex cathedra* instruction which is guaranteed; this is admitted by everybody.

But when does the pope speak *ex cathedra*, and how is it to be distinguished when he is exercising his infallibility? As to this point there are two schools, or rather two tendencies, among Catholics: some extend the privilege of infallibility to all official exercise of the supreme *magisterium*, and declare infallible, *e.g.* the papal encyclicals.[1] Others, while recognizing the supreme authority of the papal *magisterium* in matters of doctrine, confine the infallibility to those cases alone in which the pope chooses to make use of it, and declares positively that he is imposing on all the faithful the obligation of belief in a certain definite proposition, under pain of heresy and exclusion from the Church; they do not insist on any special form, but only require that the pope should clearly manifest his will to the Church. This second point of view, as clearly expounded by Mgr Joseph Fessler (1813–1872), bishop of St Pölten, who was secretary to the Vatican Council, in his work *Die wahre und die falsche Unfehlbarkeit der Päpste* (French trans. *La vraie et la fausse infaillibilité*, Paris, 1873), and by Cardinal Newman in his "Letter to the Duke of Norfolk," is the correct one, and this is clear from the fact that it has never been blamed by the ecclesiastical authority. Those who hold the latter opinion have been able to assert that since the Vatican Council no infallible definition had yet been formulated by the popes, while recognizing the supreme authority of the encyclicals of Leo XIII.

It is remarkable that the definition of the infallibility of the pope did not appear among the projects (*schemata*) prepared for the deliberations of the Vatican Council (1869). It doubtless arose from the proposed forms for the definitions of the primacy and the pontifical *magisterium*. The chapter on the infallibility was only added at the request of the bishops and after long hesitation on the part of the cardinal presidents. The proposed form, first elaborated in the conciliary commission *de fide*, was the object of long public discussions from the 50th general congregation (May 13th, 1870) to the 85th (July 13th); the constitution as a whole was adopted at a public session, on the 18th, of the 535 bishops present, two only replied "*Non placet*"; but about 50 had preferred not to be present. The controversies occasioned by this question had started from the very beginning of the Council, and were carried on with great bitterness on both sides. The minority, among whom were prominent Cardinals Rauscher and Schwarzenberg, Hefele, bishop of Rotterdam (the historian of the councils) Cardinal Mathieu, Mgr Dupanloup, Mgr Maret, &c., &c., did not pretend to deny the papal infallibility; they pleaded the inopportuneness of the definition and brought forward difficulties mainly of an historical order, in particular the famous condemnation of Pope Honorius by the 6th ecumenical council of Constantinople in 680. The majority, in which Cardinal Manning played a very active part, took their stand on theological reasons of the strongest kind; they invoked the promises of Our Lord to St Peter: "Thou art Peter, and upon this rock will I build my Church, and the gates of hell shall not prevail against her"; and again, "I have prayed for thee, Peter, that thy faith fail not; and do thou in thy turn confirm thy brethren"; they showed the popes, in the course of the ages, acting as the guardians and judges of the faith, arousing or welcoming dogmatic controversies and authoritatively settling them, exercising the supreme direction in the councils and sanctioning their decisions; they explained that the few historical difficulties did not involve any dogmatic defect in the teaching of the popes; they insisted upon the necessity of a supreme tribunal giving judgment in the name of the whole of the scattered Church; and finally, they considered that the definition had become opportune for the very reason that under the pretext of its inopportuneness the doctrine itself was being attacked.

The definition once proclaimed, controversies rapidly ceased; the bishops who were among the minority one after the other formulated their loyal adhesion to the Catholic dogma. The last to do so in Germany was Hefele, who published the decrees of the 10th of April 1871, thus breaking a long friendship with Döllinger; in Austria, where the government had thought good to revive for the occasion the royal *placet*, Mgr Haynald and Mgr Strossmayer delayed the publication, the former till the 15th of September 1871, the latter till the 26th of December 1872. In France the adhesion was rapid, and the publication was only delayed by some bishops in consequence of the disastrous war with Prussia. Though no bishops abandoned it, a few priests, such as Father Hyacinthe Loyson, and a few scholars at the German universities refused their adhesion. The most distinguished among the latter was Döllinger, who resisted all the advances of Mgr Scherr, archbishop of Munich, was excommunicated on the 17th of April 1871, and died unreconciled, though without joining any separate group. After him must be mentioned Friedrich of Munich, several professors of Bonn, and Reinkens of Breslau, who was the first bishop of the "Old Catholics." These professors formed the "Committee of Bonn," which organized the new Church. It was recognized and protected first in Bavaria, thanks to the minister Freiherr Johann von Lutz, then in Saxony, Baden, Württemberg, Prussia, where it was the pretext for, if not the cause of, the Kulturkampf, and finally in Switzerland, especially at Geneva.

For the theological aspects of the dogma of infallibility, see, among many others, L. Billot, S.J., *De Ecclesia Christi* (3 vols., Rome, 1898–1900); or G. Wilmers, S.J., *De Christi Ecclesia* (Regensburg, 1897). The most accessible popular work is that of Mgr Fessler already mentioned. For the history of the definition see VATICAN COUNCIL; also PAPACY, GALLICANISM, FEBRONIANISM, OLD CATHOLICS, &c.

(A. Bo.*)

INFAMY (Lat. *infamia*), public disgrace or loss of character. Infamy (*infamia*) occupied a prominent place in Roman law, and took the form of a censure on individuals pronounced by a competent authority in the state, which censure was the result either of certain actions which they had committed or of certain modes of life which they had pursued. Such a censure involved disqualification for certain rights both in public and in private law (see A. H. J. Greenidge, *Infamia, its Place in Roman Public and Private Law*, 1894). In English law infamy attached to a person in consequence of conviction of some crime. The effect of infamy was to render a person incompetent to give evidence

[1] It was in this sense that it was understood by Döllinger, who pointed out that the definition of the dogma would commit the Church to all past official utterances of the popes, *e.g.* the Syllabus of 1864, and therefore to a war *à outrance* against modern civilization. This view was embodied in the circular note to the Powers, drawn up by Döllinger and issued by the Bavarian prime minister Prince Hohenlohe-Schillingsfürst on April 9, 1869. It was also the view universally taken by the German governments which supported the *Kulturkampf* in a greater or less degree.—ED.

in any legal proceeding. Infamy as a cause of incompetency was abolished by an act of 1843 (6 & 7 Vict. c. 85).

The word "infamous" is used in a particular sense in the English Medical Act of 1858, which provides that if any registered medical practitioner is judged by the General Medical Council, after due inquiry, to have been guilty of infamous conduct in any professional respect, his name may be erased from the Medical Register. The General Medical Council are the sole judges of whether a practitioner has been guilty of conduct infamous in a professional respect, and they act in a judicial capacity, but an accused person is generally allowed to appear by counsel. Any action which is regarded as disgraceful or dishonourable by a man's professional brethren—such, for example, as issuing advertisements in order to induce people to consult him in preference to other practitioners—may be found infamous.

INFANCY, in medical practice, the nursing age, or the period during which the child is at the breast. As a matter of convenience it is usual to include in it children up to the age of one year. The care of an infant begins with the preparations necessary for its birth and the endeavour to ensure that taking place under the best possible sanitary conditions. On being born the normal infant cries lustily, drawing air into its lungs. As soon as the umbilical cord which unites the child to the mother has ceased to pulsate, it is tied about 2 in. from the child's navel and is divided above the ligature. The cord is wrapped in a sterilized gauze pad and the dressing is not removed until the seventh to the tenth day, when the umbilicus is healed.

The baby is now a separate entity, and the first event in its life is the first bath. The room ready to receive a new-born infant should be kept at a temperature of 70° F. The temperature of the first bath should be 100° F. The child should be well supported in the bath by the left hand of the nurse, and care should be taken to avoid wetting the gauze pad covering the cord. In some cases infants are covered with a white substance termed "vernix caseosa," which may be carefully removed by a little olive oil. Sponges should never be used, as they tend to harbour bacteria. A soft pad of muslin or gauze which can be boiled should take its place. After the first ten days 94° F. is the most suitable temperature for a bath. When the baby has been well dried the skin may be dusted with pure starch powder to which a small quantity of boric acid has been added. The most important part of the toilet of a new-born infant is the care of the eyes, which should be carefully cleansed with gauze dipped in warm water and one drop of a 2% solution of nitrate of silver dropped into each eye. The clothes of a newly born child should consist exclusively of woollen undergarments, a soft flannel binder, which should be tied on, being placed next the skin, with a long-sleeved woven wool vest and over this a loose garment of flannel coming below the feet and long enough to tuck up. Diapers should be made of soft absorbent material such as well-washed linen and should be about two yards square and folded in a three-cornered shape. An infant should always sleep in a bed or cot by itself. In 1907, of 749 deaths from violence in England and Wales of children under one month, 445 were due to suffocation in bed with adults. A healthy infant should spend most of its time asleep and should be laid into its cot immediately after feeding.

The normal infant at birth weighs about 7 lb. During the two or three days following birth a slight decrease in weight occurs, usually 5 to 6 oz. When nursing begins the child increases in weight up to the seventh day, when the infant will have regained its weight at birth. From the second to the fourth week after birth (according to Camerer) an infant should gain 1 oz. daily or 1½ to 2 lb monthly, from the fourth to the sixth month ½ to ⅔ of an oz. daily or 1 lb monthly, from the sixth to the twelfth month ½ oz. daily or less than 1 lb monthly. At the sixth month it should be twice the weight at birth. The average weight at the twelfth month is 20 to 21 lb. The increase of weight in artificially fed is less regular than in breast-fed babies.

Food.—There is but one proper food for an infant, and that is its mother's milk, unless when in exceptional circumstances the mother is not allowed to nurse her child. Artificially fed children are much more liable to epidemic diseases. The child should be applied to the breast the first day to induce the flow of milk. The first week the child should be fed at intervals of two hours, the second week eight to nine times, and the fourth week eight times at intervals of two and a half hours. At two months the child is being suckled six times daily at intervals of three hours, the last feed being at 11 P.M. Where a mother cannot nurse a child the child must be artificially fed. Cow's milk must be largely diluted to suit the new-born infant. Armstrong gives the following table of dilution:—

1st week,	milk 1 tablespoonful,	water 2	tablespoonfuls		
at 3 months,	,, 3½ tablespoonfuls,	,, 3	,,	}	added with sugar.
at 6 months,	,, 9 ,,	,, 3	,,	}	
at 9 months,	,, 12 ,,	,, 3	,,	}	

Koplik has drawn out a table of the amounts to be given as follows:—

1st day	3 feeds of	10 cc	total	1 oz.	in 24 hours
2nd day	8 ,,	20 cc	,,	5½	,,
3rd day	8 ,,	30 cc (1 oz.)	,,	8	,,
7th day	9 ,,	50 cc	,,	13½	,,
4th week	8 ,,	60 cc (2 oz.)	,,	16	,,
3 months	7 ,,	4 oz.	,,	28	,,
6 months	6 ,,	7 oz.	,,	42	,,
9 months	6 ,,	8½ oz.	,,	50	,,

In cities it is advisable that milk should be either sterilized by boiling or pasteurized, *i.e.* subjected to a form of heating which, while destroying pathogenic bacteria, does not alter the taste. The milk in a suitable apparatus is subjected to a temperature of 65° C. (149° F.) for half an hour and is then rapidly cooled to 20° C. (68° F.). Children fed on pasteurized milk should be given a teaspoonful of fresh orange juice daily to supply the missing acid and salts.

Artificial feeding is given by means of a bottle. In France all bottles with rubber tubes have been made illegal. They are a fruitful source of infection, as it is impossible to keep them clean. The best bottle is the boat-shaped one, with a wide mouth at one end, to which is attached a rubber teat, while the other end has a screw stopper. This is readily cleansed and a stream of water can be made to flow through it. All bottle teats should be boiled at least once a day for ten minutes with soda and kept in a glass-covered jar until required. A feed should be given at the temperature of 100° F.

At the ninth month a cereal may be added to the food. Before that the infant is unable to digest starchy foods. Much starch tends to constipation, and it is rarely wise to give starchy preparations in a proportion of more than 3% to children under a year old. A child who is carefully fed in a cleanly manner should not have diarrhoea, and its appearance indicates carelessness somewhere. The English registrar-general's returns for 1906 show that in the seventy-six largest towns in England and Wales 14,306 deaths of infants under one year from diarrhoea took place in July, August and September alone. These deaths are largely preventable; when Dr Budin of Paris established his "Consultations de Nourissons" the infant mortality of Paris amounted to 178 per 1000, but at the consultation the rate was 46 per 1000. At Varengeville-sur-mer a consultation for nurslings was instituted under Dr Poupalt of Dieppe in 1904. During the seven previous years the infant mortality had averaged 145 per 1000. In 1904–1905 not one infant at the consultation died, though it was a summer of extreme heat, and in 1898 when similar heat had prevailed the infant mortality was 285 per 1000. The deaths of infants under one year in England and Wales, taken from the registrar-general's returns for 1907, amounted to 117·62 per 1000 births, an alarming sacrifice of life. France has been turning her attention to the establishment of infant consultations on the lines of Dr Budin's, and similar dispensaries under the designation "Gouttes de lait" have been widely established in that country; gratifying results in the fall in infant mortality have followed. At the Fécamp dispensary the mortality from diarrhoea has fallen to 2·8, while that in neighbouring towns is from 50 to 76 per 1000 (Sir A. Simpson). It has been left to private enterprise in England to deal with this problem. The St Pancras "School for Mothers" was established in 1907 in north-west London. Though started by private persons it was in 1909 worked in connexion with the Health Department of the Borough Council, but was supported by charitable subscriptions and by a small contribution from the student mothers. There are classes for mothers on the care of their health during pregnancy, infant feeding, home nursing, cooking and needlework. Poor mothers unable to contribute get free dinners for three months previous to the birth of their child and for nine months after if the child is breast-fed. Two doctors are in attendance, and mothers are encouraged to bring their children fortnightly to be weighed, and receive advice. The average attendance is ninety. A baby is said to have "graduated" when it is a year old. An interesting development in connexion with the scheme is a class for fathers at which the medical officer of health for the district lectures on the duties of fatherhood. Similar schools for mothers are now established in Fulham and Stepney. Weighing centres have been established at Dundee, Sheffield, Nottingham, Birmingham, Aberdeen, Bolton, Belfast, and Newcastle-on-Tyne. An infants' milk depôt has been established at Finsbury, and effort is being made to establish milk laboratories where separate nursing portions of sterile milk could be supplied to poor mothers. The Walker-Gordon milk laboratories in the United States are a step in this direction.

The average length of a child at birth is $19\frac{1}{2}$ in. and during the first year the average increase is $7\frac{7}{8}$ in. A new-born infant is deaf (Koplik). This is supposed to be due to the blocking of the eustachian tubes with mucus. On the fourth day there is some evidence of hearing, and at the fifth week noises in the room disturb it. A healthy infant may be taken out of doors when a fortnight old in summer, after which it should have a daily outing, the eyes being protected from the direct rays of the sun. On the second day the eyes are sensitive to light, in the second month the infant notices colours, at the sixth month it knows its parents, and should be able to hold its head up. At the sixth month the baby begins to cut its temporary teeth. After their appearance they should be cleaned once a day by a piece of gauze moistened in boric acid solution. Attempts to stand are made about the tenth month, and walking begins about the fourteenth month. By this time the intelligence should be developed and memory is observed. A child a year old should be able to articulate a few small words. With the advent of walking and speech the period of infancy may be said to end.

See Pierre Budin, *The Nursling* (1907); Henry Koplik, *Disease of Infancy and Childhood* (1906); Eric Pritchard, *The Physiological Feeding of Infants* (1904); Eric Pritchard, *Infant Education* (1907); John Grimshaw, *Your Child's Health* (1908). (H. L. H.)

INFANT (in early forms *enfaunt*, *enfant*, through the Fr. *enfant*, from Lat. *infans*, *in*, not, and *fans*, the present participle of *fari*, to speak), a child; in non-legal use, a very young child, a baby, or one of an age suitable to be taught in an "infant school"; in law, a person under full age, and therefore subject to disabilities not affecting persons who have attained full age.

This article deals with "infants" in the last sense; for the more general sense see INFANCY and CHILD. The period of full age varies widely in different systems, as do also the disabilities attaching to nonage (non-age). In Roman law, the age of puberty, fixed at fourteen for males and twelve for females, was recognized as a dividing line. Under that age a child was under the guardianship of a tutor, but several degrees of infancy were recognized. The first was absolute infancy; after that, until the age of seven, a child was *infantiae proximus*; and from the eighth year to puberty he was *pubertati proximus*. An infant in the last stage could, with the assent of his tutor, act so as to bind himself by stipulations; in the earlier stages he could not, although binding stipulations could be made to him in the second stage. After puberty, until the age of twenty-five years, a modified infancy was recognized, during which the minor's acts were not void altogether, but voidable, and a curator was appointed to manage his affairs. The difference between the tutor and the curator in Roman law was marked by the saying that the former was appointed for the care of the person, the latter for the estate of the pupil. These principles apply only to children who are *sui juris*. The *patria potestas*, so long as it lasts, gives to the father the complete control of the son's actions. The right of the father to appoint tutors to his children by will (*testamentarii*) was recognized by the Twelve Tables, as was also the tutorship of the *agnati* (or legal as distinct from natural relations) in default of such an appointment. Tutors who held office in virtue of a general law were called *legitimi*. Besides and in default of these, tutors *dativi* were appointed by the magistrates. These terms are still used in much the same sense in modern systems founded on the Roman law, as may be seen in the case of Scotland, noticed below.

By the law of England full age is twenty-one, and all minors alike are subject to incapacities. The period of twenty-one years is regarded as complete at the beginning of the day before the birthday: for example, an infant born on the first day of January attains his majority at the first moment of the 31st of December. The incapacity of an infant is designed for his own protection, and its general effect is to prevent him from binding himself absolutely by obligations. Of the contracts of an infant which are binding *ab initio*, the most important are those relating to "necessaries." By the Sale of Goods Act 1893, an infant liable on a contract for necessaries can be sued only for a reasonable price, not necessarily the price he agreed to pay. The same statute declares "necessaries" to mean "goods suitable to the condition in life of the infant, and to his actual requirements at the time of the sale and delivery." In the case of goods having a market price, the market price is reasonable. In all other cases the question is one of fact for the jury. The protection of infants extends sometimes to transactions completed after full age; the relief of heirs who have been induced to barter away their expectations is an example. "Catching bargains," as they are called, throw on the persons claiming the benefit of them the burden of proving their substantial righteousness.

At common law a bargain made by an infant might be ratified by him after full age, and would then become binding. Lord Tenterden's act required the ratification to be in writing. But now, by the Infants' Relief Act 1874, "all contracts entered into by infants for the repayment of money lent or to be lent, or for goods supplied or to be supplied (other than contracts for necessaries), and all accounts stated, shall be absolutely void," and "no action shall be brought whereby to charge any person upon any promise made after full age to pay any debt contracted during infancy, or upon any ratification made after full age of any promise or contract made during infancy, whether there shall or shall not be any new consideration for such promise or ratification after full age." For some years after the passage of this statute highly conflicting views were held as to the meaning of the part of section 2 whereby it was enacted that "no action shall be brought whereby to charge any person . . . upon any ratification made after full age of any promise or contract made during infancy." Some authorities were of opinion that the section only applied to the three classes of contract made void by the previous section, viz. for goods supplied, money lent and on account stated. Others thought the effect to be that no contract, except for necessaries, made during infancy could be enforced after the infant came to full age. After several conflicting decisions it has been settled that both these views were wrong. Of the infant's contracts voidable at common law there were two kinds. The first kind became void at full age, unless expressly ratified. The second kind were valid, unless repudiated within a reasonable time after full age was attained by the infant. The Infants' Relief Act (section 2) strikes only at the first class and leaves the second untouched. Thus a promise of marriage made during infancy cannot be ratified so as to become actionable; but an infant's marriage settlement, being of the second class, is valid, unless it is repudiated within a reasonable time after the infant attains full age. What is a reasonable time depends on all the circumstances of the case. In a case decided in 1893 a settlement made by a female infant was allowed to be repudiated thirty years after she attained full age, but the circumstances were exceptional. A contract of marriage may be lawfully made by persons under age. Marriageable age is fourteen in males and twelve in females. So, generally, an infant may bind himself by contract of apprenticeship or service. Since the passing of the Wills Act, an infant, except he be a soldier in actual military service or a seaman at sea, is unable to make a will. Infancy is in general a disqualification for public offices and professions, *e.g.* to be a member of parliament or an elector, a mayor or burgess, a priest or deacon, a barrister or solicitor, &c.

Before 1886 the custody of an infant belonged in the first place, and against all other persons, to the father, who was said to be "the guardian of his children by nature and nurture"; and the father might by deed or will dispose of the custody or tuition of his children until the age of twenty-one.

The Guardianship of Infants Act 1886 placed the mother almost on the same footing as the father as to guardianship of infants. On the death of the father the mother becomes guardian under the statute, either alone when no guardian has been appointed by the father, or jointly with any guardian appointed by him under 12 Chas. II. c. 24. A change of the law even more important is that whereby the mother may by deed or will appoint a guardian or guardians of her infant children to act after her death. If the father survives the mother, the mother's guardian can only act if it be shown to the satisfaction of the court that the father is unfitted to be the sole guardian. On the death of the father, the guardian so appointed by the mother acts jointly with any guardian appointed by the father. The Guardianship of Infants Act 1886 also gives power to the high court and to county courts to make orders, upon the application of the mother, regarding the custody of an infant, and the right of access thereto of either parent. The court must take into consideration "the welfare of the infant, and . . . the conduct of the parents, and . . . the wishes as well of the mother as of the father." The same statute also empowers the high court of justice, "on being satisfied that it is for the welfare of the infant," to "remove from his office any testamentary guardian or any guardian appointed or acting by virtue of this act," and also to appoint another in place of the guardian so removed.

The same statute gives power to a court sitting in divorce practically to take away from a parent guilty of a matrimonial offence all rights of guardianship. When a decree for judicial separation or divorce is pronounced, the court pronouncing it may at the same time declare the parent found guilty of misconduct to be unfit to have the custody of the children of the marriage. "In such case the parent so declared to be unfit shall not, upon the death of the other parent, be entitled as of right to the custody or guardianship of such children." The court exercises this power very sparingly. When the declaration of unfitness is made, the practical effect is to give to the innocent parent the sole guardianship, as well as power to appoint a testamentary guardian to the exclusion of the guilty parent.

Another radical change has been made in the rights of parents as to guardianship of their children. In consequence of several cases where, after children had been rescued by philanthropic persons from squalid homes and improper surroundings, the courts had felt bound by law to redeliver them to their parents, the Custody of Children Act 1891 was passed. It provides that when the parent of a child applies to the court for a writ or order for the production of the child, and the court is of opinion that the parent has abandoned or deserted the child, or that he has otherwise so conducted himself that the court should refuse to enforce his right to the custody of the child, the court may, in its discretion, decline to issue the writ or make the order. If the child, in respect of whom the application is made, is being brought up by another person ("person" includes "school or institution"), or is being boarded out by poor-law guardians, the court may, if it orders the child to be given up to the parent, further order the parent to pay all or part of the cost incurred by such person or guardians in bringing up the child.

A parent who has abandoned or deserted his child is, prima facie, unfit to have the custody of the child. And before the court can make an order giving him the custody, the onus lies on him to prove that he is fit. The same rule applies where the child has been allowed by the parent "to be brought up by another person at that person's expense, or by the guardians of a poor-law union, for such a length of time and under such circumstances as to satisfy the court that the parent was unmindful of his parental duties."

The 4th section of the Custody of Children Act 1891 preserves the right of the parent to control the religious training of the infant. The father, however unfit he may be to have the custody of his child, has the legal right to require the child to be brought up in his own religion. If the father is dead, and has left no directions on the point, the mother may assert a similar right. But the court may consult the wishes of the child; and when an infant has been allowed by the father to grow up in a faith different from his own, the court will not, as a rule, order any change in the character of religious instruction. This is especially the case where the infant appears to be settled in his convictions.

In the same direction as the Custody of Children Act 1891 is the Children Act 1908, whereby considerable powers have been conferred on courts of summary jurisdiction (see CHILDREN, LAW RELATING TO).

There is not at common law any corresponding obligation on the part of either parent to maintain or educate the children. The legal duties of parents in this respect are only those created by the poor laws, the Education Acts and the Children Act 1908.

An infant is liable to a civil action for torts and wrongful acts committed by him. But, as it is possible so to shape the pleadings as to make what is in substance a right arising out of contract take the form of a right arising from civil injury, care is taken that an infant in such a case shall not be held liable. With respect to crime, mere infancy is not a defence, but a child under seven years of age is presumed to be incapable of committing a crime, and between seven and fourteen his capacity requires to be affirmatively proved. After fourteen an infant is *doli capax.*

The law of Scotland follows the leading principles of the Roman law. The period of minority (which ends at twenty-one) is divided into two stages, that of absolute incapacity (until the age of fourteen in males, and twelve in females), during which the minor is in pupilarity, and that of partial incapacity (between fourteen and twenty-one), during which he is under curators. The guardians (or tutors) of the pupil are either tutors-nominate (appointed by the father in his will); tutors-at-law (being the next male agnate of twenty-five years of age), in default of tutors-nominate; or tutors-dative, appointed by royal warrant in default of the other two. No act done by the pupil, or action raised in his name, has any effect without the interposition of a guardian. After fourteen, all acts done by a minor having curators are void without their concurrence. Every deed in nonage, whether during pupilarity or minority, and whether authorized or not by tutors or curators, is liable to reduction on proof of "lesion," *i.e.* of material injury, due to the fact of nonage, either through the weakness of the minor himself or the imprudence or negligence of his curators. Damage in fact arising on a contract in itself just and reasonable would not be lesion entitling to restitution. Deeds in nonage, other than those which are absolutely null *ab initio*, must be challenged within the *quadriennium utile*, or four years after majority.

The Guardianship of Infants Act 1886, the Custody of Children Act 1891 and the Children Act 1908, mentioned above, all apply to Scotland.

In the United States, the principles of the English common law as to infancy prevail, generally the most conspicuous variations being those affecting the age at which women attain majority. In many states this is fixed at eighteen. There is some diversity of practice as to the age at which a person can make a will of real or personal estate.

INFANTE (Spanish and Portuguese form of Lat. *infans*, young child), a title of the sons of the sovereign of Spain and Portugal, the corresponding *infanta* being given to the daughters. The title is not borne by the eldest son of the king of Spain, who is prince of Asturias, *Il principe de Asturias.* Until the severance of Brazil from the Portuguese monarchy, the eldest son was prince of Brazil. While a son or daughter of the sovereign of Spain is by right infante or infanta of Spain, the title, alone, is granted to other members of the blood royal by the sovereign.

INFANTICIDE, the killing of a newly-born child or of the matured foetus. When practised by civilized peoples the subject of infanticide concerns the criminologist and the jurist; but its importance in anthropology, as it involves a widespread practice among primitive or savage nations, requires more detailed attention. J. F. McLennan (*Studies in Ancient History*, pp. 75 et seq.) suggests that the practice of female infanticide was once universal, and that in it is to be found the origin of exogamy. Much evidence, however, has been adduced against this hypothesis by Herbert Spencer and Edward Westermarck. Infanticide, both of males and females, is far less widespread among savage races than McLennan supposed. It certainly is common in many lands, and more females are killed than males; but among many fierce and savage peoples it is almost unknown. Thus among the Tuski, Ahts, Western Eskimo and the Botocudos new-born children are killed now and then, if they are weak and deformed, or for some other reason (such as the superstition attaching to birth of twins) but without distinction of sex. Among the Dakota Indians and Crees female infanticide is rare. The Blackfoot Indians believe that a woman guilty of such an act will never reach "the Happy Mountain" after death, but will hover round the scene of her misdeed with branches of trees tied to her legs. The Aleutians hold that child-murder brings misfortune on the whole village. Among the Abipones it is common, but the boys are usually the victims, because it is customary to buy a wife for a son, whereas a grown daughter will always command a price. In Africa, where a warm climate and abundance of food simplify the problem of existence, the crime is not common. Herr Valdau relates that a Bakundu woman, accused of it, was condemned to death. In Samoa, in the Mitchell and Hervey Islands, and in parts of New Guinea, it was unheard of; while among the cannibals, the Solomon Islanders, it occurred rarely. A theory has been advanced by L. Fison (*Kamilaroi and Kurnai*, 1880) that female infanticide is far less common among the lower savages than among the more advanced tribes. Among some of the most degraded of human beings, such as the Yahgans of Tierra del Fuego, the crime was unknown, except when committed by the mother "from jealousy or hatred of her husband or because of desertion and wretchedness." It is said that certain Californian Indians were never guilty of child-murder before the arrival of the whites; while Wm. Ellis (*Polynesian Researches*, i. 249) thinks it most probable that the custom was less prevalent in earlier than later Polynesian history. The weight of evidence tends to support Darwin's theory that during the earliest period of human development man did not lose that strong instinct, the love of his young, and consequently did not practice infanticide; that, in short, the crime is not characteristic of primitive races.

Infanticide may be said to arise from four reasons. It may be (1) an act of callous brutality or to satisfy cannibalistic cravings. A Fuegian, Darwin relates, dashed his child's brains out for upsetting a basket of fish. An Australian, seeing his infant son ill, killed, roasted and ate him. In some parts of Africa the negroes bait lion-traps with their own children. Some South American Indians, such as the Moxos, abandon or kill them without reason; while African and Polynesian cannibals eat them without the excuse of the periodic famines which made the Tasmanians regard the birth of a child as a piece of good fortune.

2. Or infanticide may be the result of the struggle for existence. Thus in Polynesia, while the climate ensures food in plenty, the relative smallness of the islands imposed the custom on all families without distinction. In the Hawaiian Islands all children, after the third or fourth, were strangled or buried alive. At Tahiti fathers had the right (and used it) of killing their newly-born children by suffocation. The chiefs were obliged by custom to kill all their daughters. The society of the Areois, famous in the Society Islands, imposed infanticide upon the women members by oath. In other islands all girl-children were spared, but only two boys in each family were reared. The difficulties of suckling partly explain the custom of killing twins. For the same reason the Eskimo and Red Indians used to bury the infant with the mother who died in child-birth. Among warrior and hunter tribes, where women could not act as beasts of burden as in agricultural communities, and where a large number of girls were likely to attract the hostile attentions of neighbouring tribesmen, girl-babies were murdered. Arabs, in ancient times, buried alive the majority of female children. In many lands infanticide was regarded as a meritorious act on the part of a parent, done, as a precaution against famine, in the interests of the tribe. In other parts of the world, infanticide results from customs which impose heavy burdens on child-rearing. Of these artificial hardships the best example is afforded by India. There the practice, though forbidden by both the Vedas and the Koran, prevailed among the Rajputs and certain aboriginal tribes. Among the aristocratic Rajputs, it was thought dishonourable that a girl should remain unmarried. Moreover, a girl may not marry below her caste; she ought to marry her superior, or at least her equal. This reasoning was most powerful with the highest castes, in which the disproportion of the sexes was painfully apparent. But, assuming marriage to be possible, it was ruinously expensive to the bride's father, the cost in the case of some rajahs having been known to exceed £100,000. To avoid all this, the Rajput killed a proportion of his daughters—sometimes in a very singular way. A pill of tobacco and bhang might be given to the new-born child; or it was drowned in milk;[1] or the mother's breast was smeared with opium or the juice of the poisonous *datura*. A common method was to cover the child's mouth with a plaster of cow-dung, before it drew breath. Infanticide was also practised to a small extent by some sects of the aboriginal Khonds and by the poorer hill-tribes of the Himalayas. Where infanticide occurs in India, though it really rests on the economic facts stated, there is usually some poetical tradition of its origin. Infanticide from motives of prudence was common among some American Indian tribes of the northwest, with whom the "potlatch" was an essential part of their daughter's marriage ceremonies.

3. Or infanticide may be in the nature of a religious observance. The gods must be appeased with blood, and it is believed that no sacrifice can be so pleasing to them as the child of the worshipper. Such were the motives impelling parents to the burning of children in the worship of Moloch. In India children were thrown into the sacred river Ganges, and adoration paid to the alligators who fed on them. Where the custom prevails as a sacrifice the male child is usually the victim.

4. Or, finally, infanticide may have a social or political reason. Thus at Sparta (and in other places in early Greek and Roman history) weakly or deformed children were killed by order of the state, a custom approved in the ideal systems of Aristotle and Plato, and still observed among the Eskimo and the Kamchadales.

Authorities.—Herbert Spencer, *Principles of Sociology*, i. 614-619; McLennan, *Studies in Ancient History*, pp. 75 et seq.; McLennan, "Exogamy and Endogamy" in the *Fortnightly Review*, xxi. 884 et seq.; Darwin, *Descent of Man*, ii. 400 et seq.; L. Fison, and A. W. Howitt, *Kamilaroi and Kurnai* (1880); Westermarck, *History of Human Marriage* (1894); Browne, *Infanticide: Its Origin, Progress and Suppression* (London, 1857); Lord Avebury, *Prehistoric Times* (1900), and *Origin of Civilization* (1902).

Law.—The crime of infanticide among civilized nations is still frequent. It is however due in most cases to abnormal causes, such as a sudden access of insanity, privation, unreasoning dislike to the child, &c. It is most closely connected with illegitimacy in the class of farm and domestic servants, the more common motive being the terror of the mother of incurring the disgrace with which society visits the more venial offence. Often, however, it is inspired by no better motive than the wish to escape the burden of the child's support. The granting of affiliation orders thus tends to save the lives of many children, though it provides a motive for the paramour sometimes to share in the crime. The laws of the European states differ widely on this subject—some of them treating infanticide as a special crime, others regarding it merely as a case of murder

[1] In Baluchistan, where children are often drowned in milk, there is a euphemistic proverb: "The lady's daughter died drinking milk."

of unusually difficult proof. In the law of England infanticide is murder or manslaughter according to the presence or absence of deliberation. The infant must be a human being in the legal sense; and "a child becomes a human being when it has completely proceeded in a living state from the body of its mother, whether it has breathed or not, and whether it has an independent circulation or not, and whether the navel-string is severed or not; and the killing of such a child is homicide when it dies after birth in consequence of injuries received before, during or after birth." A child in the womb or in the act of birth, though it may have breathed, is therefore not a human being, the killing of which amounts to homicide. The older law of child murder under a statute of James I. consisted of cruel presumptions against the mother, and it was not till 1803 that trials for that offence were placed under the ordinary rules of evidence. The crown now takes upon itself the onus of proving in every case that the child has been alive. This is often a matter of difficulty, and hence a frequent alternative charge is that of concealment of birth (see BIRTH), or concealment of pregnancy in Scotland. It is the opinion of the most eminent of British medical jurists that this presumption has tended to increase infanticide. Apart from this, the technical definition of human life has excited a good deal of comment and some indignation. The definition allows many wicked acts to go unpunished. The experience of assizes in England shows that many children are killed when it is impossible to prove that they were wholly born. The distinction taken by the law was probably comprehended by the minds of the class to which most of the unhappy mothers belong. Partly to meet this complaint it was suggested to the Royal Commission of 1866 that killing during birth, or within seven days thereafter, should be an offence punishable with penal servitude. The second complaint is of an opposite character—partly that infanticide by mothers is not a fit subject for capital punishment, and partly that, whatever be the intrinsic character of the act, juries will not convict or the executive will not carry out the sentence. Earl Russell gave expression to this feeling when he proposed that no capital sentence should be pronounced upon mothers for the killing of children within six months after birth. When there has been a verdict of murder, sentence of death must be passed, but the practice of the Home Office, as laid down in 1908, is invariably to commute the death sentence to penal servitude for life. The circumstances of the case and the disposition and general progress of the prisoners under discipline in a convict prison are then determining factors in the length of subsequent detention, which rarely exceeds three years. After release, the prisoner's further progress is carefully watched, and if it is seen to be to her advantage the conditions of her release are cancelled and she is restored to complete freedom.

In India measures against the practice were begun towards the end of the 18th century by Jonathan Duncan and Major Walker. They were continued by a series of able and earnest officers during the 19th century. One of its chief events, representing many minor occurrences, was the Amritsar durbar of 1853, which was arranged by Lord Lawrence. At that meeting the chiefs residing in the Punjab and the trans-Sutlej states signed an agreement engaging to expel from caste every one who committed infanticide, to adopt fixed and moderate rates of marriage expenses, and to exclude from these ceremonies the minstrels and beggars who had so greatly swollen the expense. According to the present law, if the female children fall below a certain percentage in any tract or among any tribe in northern India where infanticide formerly prevailed, the suspected village is placed under police supervision, the cost being charged to the locality. By these measures, together with a strictly enforced system of reporting births and deaths, infanticide has been almost trampled out; although some of the Rājput clans keep their female offspring suspiciously close to the lowest average which secures them from surveillance.

It is difficult to say to what extent infanticide prevails in the United Kingdom. At one time a large number of children were murdered in England for the purpose of obtaining the burial money from a benefit club,[1] but protection against this risk has been provided for by the Friendly Societies Act 1896, and the Collecting Societies Act 1896. The neglect or killing of nurse-children is treated under BABY-FARMING, and CHILDREN, LAW RELATING TO.

In the United States, the elements of this offence are practically the same as in England. The wilful killing of an unborn child is not manslaughter unless made so by statute. To constitute manslaughter under Laws N.Y. 1869, ch. 631, by attempts to produce miscarriage, the "quickening" of the child must be averred and proved (*Evans* v. *People*, 49 New York Rep. 86; see also *Wallace* v. *State*, 7 Texas app. 570).

INFANTRY, the collective name of soldiers who march and fight on foot and are armed with hand-weapons. The word is derived ultimately from Lat. *infans*, infant, but it is not clear how the word came to be used to mean soldiers. The suggestion that it comes from a guard or regiment of a Spanish infanta about the end of the 15th century cannot be maintained in view of the fact that Spanish foot-soldiers of the time were called *soldados* and contrasted with French *fantassins* and Italian *fanteria*. The *New English Dictionary* suggests that a foot-soldier, being in feudal and early modern times the varlet or follower of a mounted noble, was called a boy (cf. *Knabe*, *garçon*, footman, &c., and see VALET).

Historical Sketch

The importance of the infantry arm, both in history and at the present time, cannot be summed up better and more concisely than in the phrase used by a brilliant general of the Napoleonic era, General Morand—"*L'infanterie, c'est l'armée.*"

It may be confidently asserted that the original fighting man was a foot-soldier. But infantry was differentiated as an "arm" considerably later than cavalry; for when a new means of fighting (a chariot or a horse) presented itself, it was assimilated by relatively picked men, chiefs and noted warriors, who *ipso facto* separated themselves from the mass or reservoir of men. How this mass itself ceased to be a mere residue and developed special characteristics; how, instead of the cavalry being recruited from the best infantry, cavalry and infantry came to form two distinct services; and how the arm thus constituted organized itself, technically and tactically, for its own work—these are the main questions that constitute the historical side of the subject. It is obvious that as the "residue" was far the greatest part of the army, the history of the foot-soldier is practically identical with the history of soldiering.

It was only when a group of human beings became too large to be surprised and assassinated by a few lurking enemies, that proper fighting became the normal method of settling a quarrel or a rivalry. Two groups, neither of which had been able to surprise the other, had to meet face to face, and the instinct of self-preservation had to be reconciled with the necessity of victory. From this it was an easy step to the differentiation of the champion, the proved excellent fighting man, and to providing this man, on whom everything depended, with all assistance that better arms, armour, horse or chariot could give him. But suppose our champion slain, how are we to make head against the opposing champion? For long ages, we may suppose, the latter, as in the *Iliad*, slaughtered the sheep who had lost their shepherd, but in the end the "residue" began to organize itself, and to oppose a united front to the enemy's champions—in which term we include all selected men, whether horsemen, charioteers or merely specially powerful axemen and swordsmen. But once the individual had lost his commanding position, the problem presented itself in a new form—how to ensure that every member of the group did his duty by the others—and the solution of this problem for the conditions of the ancient hand-to-hand struggle marks the historical beginning of infantry tactics.

Gallic warriors bound themselves together with chains. The Greeks organized the city state, which gave each small army

[1] See *Report on the Sanitary Condition of the Labouring Classes*, "Supplementary Report on Interment in Towns," by Edwin Chadwick (*Parl. Papers*, 1843, xii. 395); and *The Social Condition and Education of the People*, by Joseph Kay (1850).

solidarity and the sense of duty to an ideal, and the phalanx, in which the file-leaders were in a sense champions yet were made so chiefly by the unity of the mass. But the Romans went farther. Besides developing solidarity and a sense of duty, they improved on this conception of the battle to such a degree that as a nation they may be called the best tacticians who ever existed. Giving up the attempt to make all men fight equally well, they dislocated the mass of combatants into three bodies, of which the first, formed of the youngest and most impressionable men, was engaged at the outset, the rest, more experienced men, being kept out of the turmoil. This is the very opposite of the "champion" system. Those who would have fled after the fall of the champions are engaged and "fought out" before the champions enter the area of the contest, while the champions, who possess in themselves the greatest power of resisting and mastering the instinct of self-preservation, are kept back for the moment when ordinary men would lose heart.

The phalanx and the legion.

It might be said with perfect justice that without infantry there would never have been discipline, for cavalry began and continued as a crowd of champions. Discipline, which created and maintained the intrinsic superiority of the Roman legion, depended first on the ideal of patriotism. This was ingrained into every man from his earliest years and expressed in a system of rewards and punishments which took effect from the same ideal, in that rewards were in the main honorary in character (mural crowns, &c.), while no physical punishment was too severe for the man who betrayed, by default or selfishness, the cause of Rome. Secondly, though every man knew his duty, not every man was equal to doing it, and in recognition of this fact the Romans evolved the system of three-line tactics in which the strong parts of the machine neutralized the weak. The first of these principles, being psychological in character, rose, flourished and decayed with the *moral* of the nation. The second, deduced from the first, varied with it, but as it was objectively expressed in a system of tactics, which had to be modified to suit each case, it varied also in proportion as the combat took more or less abnormal forms. So closely knit were the parts of the system that not only did the decadence of patriotism sap the legionary organization, but also the unsuitability of that organization to new conditions of warfare reacted unfavourably, even disastrously, on the *moral* of the nation. Between them, the Roman infantry fell from its proud place, and whereas in the Republic it was familiarly called the "strength" (*robur*), by the 4th century A.D. it had become merely the background for a variety of other arms and corps. Luxury produced "egoists," to whom the rewards meant nothing and the punishments were torture for the sake of torture. When therefore the Roman *imperium* extended far enough to bring in silks from China and ivory from the forests of central Africa, the citizen-army ceased to exist, and the mere necessity for garrisoning distant savage lands threw the burden of service upon the professional soldier.

The natural consequence of this last was the uniform training of every man. There were no longer any primary differences between one cohort and another, and though the value of the three-line system in itself ensured its continuance, any cohort, however constituted, might find itself serving in any one of the three lines, *i.e.* the *moral* of the last line was no better than that of the first. The best guarantee of success became *uniform* regimental excellence, and whereas Camillus or Scipio found useful employment in battle for every citizen, Caesar complained that a legion which had been sent him was too raw, though it had been embodied for nine years. The conditions which were so admirably met by the old system never reappeared; for before armies resumed a "citizen" character the invention of firearms had subjected all ranks and lines alike to the same ordeal of facing unseen death, and the old soldiers were better employed in standing shoulder to shoulder with the young. In brief, the old Roman organization was based on patriotism and experience, and when patriotism gave place to "egoism," and the experience of the citizen who spent every other summer in the field of war gave place to the formal training of the paid recruit, it died, unregretted either by the citizen or by the military chieftain. The latter knew how to make the army his devoted servant, while the former disliked military service and failed to prepare himself for the day when the military chief and the mercenary overrode his rights and set up a tyranny, and ultimately the inner provinces of the empire came to be called *inermes*—unarmed, defenceless—in contrast to the borderland where the all-powerful professional legions lay in garrison.

The Roman Imperial Army.

In these same frontier provinces the tactical disintegration of the legion slowly accomplished itself. Originally designed for the exigencies of the normal pitched battle on firm open fields, and even after its professionalization retaining its character as a large battle unit, it was soon fragmented through the exigencies of border warfare into numerous detachments of greater or less size, and when the military frontier of the empire was established, the legion became an almost sedentary corps, finding the garrisons for the blockhouses on its own section of the line of defence. Further, the old heavy arms and armour which had given it the advantage in wars of conquest—in which the barbarians, gathering to defend their homes, offered a target for the blow of an army—were a great disadvantage when it became necessary to police the conquered territory, to pounce upon swiftly moving bodies of raiders before they could do any great harm. Thus gradually cavalry became more numerous, and light infantry of all sorts more useful, than the old-fashioned linesman. To these corps went the best recruits and the smartest officers, the opportunities for good service and the rewards for it. The legion became once more the "residue." Thus when the "champion" reappeared on the battlefield the solidarity that neutralized his power had ceased to exist.

The battle of Adrianople, the "last fight of the legion," illustrates this. The frontal battle was engaged in the ordinary way, and the cohorts of the first line of the imperial army were fighting man to man with the front ranks of the Gothic infantry (which had indeed a solidarity of its own, unlike the barbarians of the early empire, and was further guaranteed against moral over-pressure by a wagon laager), when suddenly the armoured heavy cavalry of the Goths burst upon their flank and rear. There were no longer *Principes* and *Triarii* of the old Republican calibre, but only average troops, in the second and third lines, and they were broken at once. The first line felt the battle in rear as well as in front and gave way. Thereafter the victors, horse and foot, slaughtered unresisting herds of men, not desperate soldiers, and on this day the infantry arm, as an arm, ceased to exist.

Of course, not every soldier became a horseman, and still fewer could provide themselves with armour. Regular infantry, too, was still maintained for siege, mountain and forest warfare. But the *robur*, the kernel of the line of battle, was gone, and though a few of the peoples that fought their way into the area of civilization in the dark ages brought with them the natural and primitive method of fighting on foot, it was practically always a combination of mighty champions and "residue," even though the latter bound themselves together by locked shields, as the Gauls had bound themselves long before with chains, to prevent "skulking," These infantry nations, without any infantry system comparable to that of the Greeks and Romans, succumbed in turn to the crowd of mounted warriors—not like the Greeks and Romans for want of good military qualities, but for want of an organization which would have distributed their fighting powers to the best advantage. One has only to study the battle of Hastings to realize how completely the infantry masses of the English slipped from the control of their leaders directly the front ranks became seriously engaged. For many generations after Hastings there was no attempt to use infantry as the kernel of armies, still less to organize it as such beforehand. Indeed, except in the Crusades, where men of high and of low degree alike fought for their common faith, and in sieges, where cavalry was powerless and the services of archers and labourers were at a premium, it became quite unusual for infantry to appear on the field at all.

The Dark Ages.

The tactics of feudal infantry at its best were conspicuously illustrated in the battle of Bouvines, where besides the barons, knights and sergeants, the Brabançon mercenaries (heavy foot) and the French communal militia opposed one another.

Bouvines.

On the French right wing, the opportune arrival of a well-closed mass of cavalry and infantry in the flank of a loose crowd of men-at-arms which had already been thoroughly engaged, decided the fight. In the centre, the respective infantries were in first line, the nobles and knights, with their sovereigns, in second, yet it was a mixed mass of both that, after a period of confused fighting, focussed the battle in the persons of the emperor and the king of France, and if the personal encounters of the two bodies of knights gave the crowded German infantry a momentary chance to strike down the king, the latter was soon rescued by a half-dozen of heavy cavalrymen. On the left wing, the count of Boulogne made a living castle of his Brabançon pikes, whence with his men-at-arms he sallied forth from time to time and played the champion. Lastly, the Constable Montmorency brought over what was still manageable of the corps that had defeated the cavalry on the right (nearly all mounted men) and gave the final push to the allied centre and right in succession. Then the imperial army fled and was slaughtered without offering much resistance. Of infantry in this battle there was enough and to spare, but its only opportunities for decisive action were those afforded by the exhaustion of the armoured men or by the latter becoming absorbed in their own single combats to the exclusion of their proper work in the line of battle. As usual the infantry suffered nine-tenths of the casualties. For all their numbers and apparent tactical distribution on this field, they were "residue," destitute of special organization, training or utility; and the only suggestion of "combined tactics" is the expedient adopted by the count of Boulogne, rings of spearmen to serve as pavilions served in the tournament—to secure a decorous setting for a display of knightly prowess.

In those days in truth the infantry was no more the army than to-day the shareholders of a limited company are the board of directors. They were deeply, sometimes vitally, interested in the result, but they contributed little or nothing to bringing it about, except when the opposing cavalries were in a state of moral equilibrium, and in these cases anything suffices—the appearance of camp followers on a "Gillies Hill," as at Bannockburn or the sound of half-a-dozen trumpets—to turn the scale. Once it turned, the infantry of the beaten side was cut down unresistingly, while the more valuable prisoners were admitted to ransom. Thereafter, feudal tactics were based principally on the ideas of personal glory—won in single combat, champion against champion, and of personal profit—won by the knight in holding a wealthy and well-armed baron to ransom and by the foot-soldier in plundering while his masters were fighting. In the French army, the term *bidaux*, applied in the days of Bouvines to all the infantry other than archers and arblasters, came by a quite natural process to mean the laggards, malingerers and skulkers of the army.

Revival of infantry.

But even this infantry contained within itself two half-smothered sparks of regeneration, the idea of *archery* and the idea of *communal militia*. Archery, in whatever form practised, was the one special form of military activity with which the heavy *gendarme* (whether he fought on horseback or dismounted) had no concern. Here therefore infantry had a special function, and in so far ceased to be "residue." The communal militia was an early and inadequate expression of the town-spirit that was soon to produce the solid burgher-militia of Flanders and Germany and after that the trained bands of the English cities and towns. It therefore represented the principles of solidarity, of combination, of duty to one's comrade and to the common cause—principles which had disappeared from feudal warfare.[1] It was under the influence of these two ideas or forces that infantry as an arm began once again, though slowly and painfully, to differentiate itself from the mass of *bidaux* until in the end the latter practically contained only the worthless elements.

Courtrai.

The first true infantry battle since Hastings was fought at Courtrai in 1302, between the burghers of Bruges and a feudal army under Count Robert of Artois. The citizens, arrayed in heavy masses, and still armed with miscellaneous weapons, were careful to place themselves on ground difficult of access—dikes, pools and marshes—and to fasten themselves together, like the Gauls of old. Their van was driven back by the French communal infantry and professional crossbowmen, whereupon Robert of Artois, true feudal leader as he was, ordered his infantry to clear the way for the cavalry and without even giving them time to do so pushed through their ranks with a formless mass of gendarmerie. This, in attempting to close with the enemy, plunged into the canals and swamped lands, and was soon immovably fastened in the mud. The citizens swarmed all round it and with spear, cleaver and flail destroyed it. Robert himself with a party of his gendarmerie strove to break through the solid wall of spears, but in vain. He was killed and his army perished with him, for the citizens did not regard war as a game and ransom as the loser's forfeit. As for the communal infantry which had won the first success, it had long since disappeared from the field, for when count Robert ordered his heavy cavalry forward, they had thought themselves attacked in rear by a rush of hostile cavalry—as indeed they were, for the gendarmerie rode them down—and melted away.

Crécy (*q.v.*) was fought forty-four years after Courtrai. Here the knights had open ground to fight on, and many boasted that they would revenge themselves. But they encountered not merely infantry, but infantry tactics, and were for the second, and not the last, time destroyed. The English army included a large feudal element, but the spirit of indiscipline had been crushed by a series of iron-handed kings, and for more than a century the nobles, in so far as they had been bad subjects, had been good Englishmen. The English yeomen had reached a level of self-discipline and self-respect which few even of the great continental cities had attained. They had, lastly, made the powerful long-bow (see ARCHERY) their own, and Edward I. had *combined* the shock of the heavy cavalry with the slow searching preparatory rain of arrows (see FALKIRK). That is, infantry tactics and cavalry tactics were co-ordinated by a *general*, and the special point of this for the present purpose is that instead of being, as in France, the unstable base of the so-called "feudal pyramid," infantry has become an *arm*, capable of offence and defence and having its own special organization, function in the line of battle and tactical method. This last, indeed, like every other tactical method, rested ultimately on the *moral* of the men who had to put it into execution. Archer tactics did not serve against the disciplined rush of Joan of Arc's gendarmerie, for the solidarity of the archer companies that tried to stop it had long been undermined.

The English archer.

Yet we cannot overrate the importance of the archer in this period of military history. In the city militias solidarity had been obtained through the close personal relationship of the trade gilds and by the elimination of the champion. Therefore, as every offensive in war rests upon boldness, these militias were essentially defensive, for they could only hope to ward off the feudal champion, not to outfight him (Battle of Legnano, 1176. See Oman, p. 442). England, however, had evolved a weapon which no armour could resist, and a race of men as fully trained to use it as the gendarme was to use the lance.[2] This weapon gave them the power of killing without being killed, which the citizens' spears and maces and voulges did not. But like all missiles, arrows were a poor stand-by in the last resort if determined cavalry crossed the "beaten zone" and closed in, and besides pavises and pointed stakes the English archers were given the support of the knights, nobles and sergeants—the armoured champions—whose steady lances guaranteed their safety. Here was the real forward stride in infantry tactics. Archery had existed from time immemorial, and a mere technical improvement in its weapon could hardly account for its suddenly becoming the queen of the battlefield. The defensive power of the "dark impenetrable wood" of spears had been demonstrated again and again, but when the cavalry had few or no preliminary difficulties to face, the chances of the infantry mass resisting long-continued pressure was small. It was the combination of the two elements that made possible a Crécy and a Poitiers, and this combination was the result of the English social system which produced the

[1] At Bouvines, it is recorded with special emphasis that Guillaume des Barres, when in the act of felling the emperor, heard the call to rescue King Philip Augustus and, forfeiting his rich prize, made his way back to help his own sovereign.

[2] Crossbows indeed were powerful, and also handled by professional soldiers (*e.g.* the Genoese at Crécy), but they were slow in action, six times as slow as the long bow, and the impatient gendarmerie generally became tired of the delay and crowded out or rode over the crossbowmen.

camaraderie of knight and yeoman, champion and plain soldier. Fortified by the knight's unshakeable steadiness, the yeoman handled his bow and arrows with cool certainty and rapidity, and shot down every rush of the opposing champions. This was *camaraderie de combat* indeed, and in such conditions the offensive was possible and even easy. The English conquered whole countries while the Flemish and German spearmen and vougiers merely held their own. For them, decisive victories were only possible when the enemy played into their hands, but for the English the guarantee of such victories was the specific character of their army itself and the tactical methods resulting from and expressing that character.

But the war of conquest embodied in these decisive victories dwindled in its later stages to a war of raids. The feudal lord, like the feudal vassal, returned home and gave place to the professional man-at-arms and the professional captain. Ransom became again the chief object, and except where a great leader, such as Bertrand Du Guesclin, compelled the mercenaries to follow him to death or victory, a battle usually became a mêlée of irregular duels between men-at-arms, with all the selfishness and little of the chivalry of the purely feudal encounter. The war went on and on, the gendarmes thickened their armour, and the archers found more difficulty in penetrating it. Moreover, in raids for devastation and booty, the slow-moving infantryman was often a source of danger to his comrades. In this *guerrilla* the archer, though he kept his place, soon ceased to be the mainstay of battle. It had become customary since Crécy (where the English knights and sergeants were dismounted to protect the archers) for all mounted men to send away their horses before engaging. Here and there cavalry masses were used by such energetic leaders as the Black Prince and Du Guesclin, and more often a few men remained mounted for work requiring exceptional speed and courage,[1] but as a general rule the man-at-arms was practically a mounted infantryman, and when he dismounted he stood still. Thus two masses of dismounted lances, mixed with archers, would meet and engage, but the archers, the offensive element, were now far too few in proportion to the lances, the purely defensive element, and battles became indecisive skirmishes instead of overwhelming victories.

The Hundred Years' War.

Cavalry therefore became, in a very loose sense of the word, infantry. But we are tracing the history not of all troops that stood on their feet to fight, but of infantry and the special tactics of infantry, and the period before and after 1370, when the moral foundations of the new English tactics had disappeared, and the personality of Du Guesclin gave even the bandits of the "free companies" an intrinsic, if slight, superiority over the invaders, is a period of deadlock. Solidarity, such as it was, had gone over to the side of the heavy cavalry. But the latter had deliberately forfeited their power of forcing the decision by fighting on foot, and the English archer, the cadre of the English tactical system, though diminished in numbers, prestige and importance, held to existence and survived the deadlock. Infantry of that type indeed could never return to the "residue" state, and it only needed a fresh moral impetus, a Henry V., to set the old machinery to work again for a third great triumph. But again, after Agincourt, the long war lapsed into the hands of the soldiers of fortune, the basis of Edward's and Henry's tactics crumbled, and, led by a greater than Du Guesclin, the knights and the nobles of France, and the mercenary captains and men-at-arms as well, *rode down* the stationary masses of the English, lances and bowmen alike.

The net result of the Hundred Years' War therefore was to re-establish the two arms, cavalry and infantry, side by side, the one acting by shock, and the other by fire. The lesson of Crécy was "prepare your charge before delivering it," and for that purpose great bodies of infantry armed with bows, arblasts and handguns were brought into existence in France. When the French king in 1448 put into force the "lessons of the war" and organized a permanent army, it consisted in the main of heavy cavalry (knights and squires in the "ordonnance" companies, soldiers of fortune in the paid companies) and archers and arblasters (*francs-archers* recruited nationally, arblasters as a rule mercenaries, though largely recruited in Gascony). To these *armes de jet* were added, in ever-increasing numbers, hand firearms. Thus the "fire" principle of attack was established, and the defensive principle of "mass" relegated to the background. In such circumstances cavalry was of course the decisive arm, and the reputation of the French gendarmerie was such as to justify this bold elimination of the means of passive defence.[2]

Burgher militias.

The foot-soldier of Germany and the Low Countries had followed a very different line of development. Here the rich commercial cities scarcely concerned themselves with the quarrels or revolts of neighbouring nobles, but they resolutely defended their own rights against feudal interference, and enforced them by an organized militia, opposing the strict solidarity of their own institutions to the prowess of the champion who threatened them. The struggle was between "you shall" on the part of the baron and "we will not" on the part of the citizens, the offensive *versus* the defensive in the simplest and plainest form. The latter was a policy of unbreakable squares, and wherever possible, strong positions as well. Sometimes the citizens, sometimes the nobles gained the day, but the general result was that steady infantry in proper formation could not be ridden down, and as yeomen-archers of the English type to "prepare" the charge were not obtainable from amongst the serf populations of the countryside, the problem of the attack was, for Central Europe, insoluble.

The Wagenburg.

The unbreakable square took two forms, the *wagenburg* with artillery, and the infantry mass with pikes. The first was no more, in the beginning, than an expedient for the safe and rapid crossing of wider stretches of open country than would have been possible for dismounted men, whom the cavalry headed off as soon as they ventured far enough from the shelter of walls. The men rode not on horses but on carriages, and the carriages moved over the plains in laager formation, the infantrymen standing ready with halbert and voulge or short stabbing spear, and the gunners crouching around the long barrelled two-pounders and the "ribaudequins"—the early machine guns—which were mounted on the wagons. These *wagenburgen* combined in themselves the due proportions of mobility and passive defence, and in the skilled hands of Ziska they were capable of the boldest offensive. But such a tactical system depended first of all on drill, for the armoured cavalry would have crowded through the least gap in the wagon line, and the necessary degree of drill in those days could only be attained by an army which had both a permanent existence and some bond of solidarity more powerful than the incentive to plunder—that is, in practice, it was only attained in full by the Hussite insurgents. The cavalry, too, learned its lesson, and pitted mobile three-pounders against the foot-soldiers' one- and two-pounders, and the *wagenburg* became no more than a helpless target. Thus when, not many years after the end of the Hussite wars, the Wars of the Roses eliminated the English model and the English tactics from the military world of Europe, the French system of fire tactics—masses of archers, arblasters and handgun-men, with some spearmen and halberdiers to stiffen them—was left face to face with that of the Swiss and Landsknechts, the system of the "long pike."

The Swiss.

A series of victories ranging from Morgarten (1315) to Nancy (1477) had made the Swiss the most renowned infantry in Europe. Originally their struggles with would-be oppressors had taken the form, often seen elsewhere, of arraying solid masses of men, united in purpose and fidelity to one another rather than by any material or tactical cohesion. Like the men of Bruges at Courtrai, the Swiss had the advantage of broken ground, and the still greater advantage of being opposed by reckless feudal cavalry. Their armament at this stage was not peculiar—voulges, gisarmes, halberts and spears—though they were specially adept in the use of the two-handed sword. But as time went on the long pike (said to have originated in Savoy or the Milanese about 1330)

[1] As for instance when thirty men-at-arms "cut out" the Captal de Buch from the midst of his army at Cocherel.

[2] This tendency of the French military temperament reappears at almost every stage in the history of armies.

became more and more popular until at last on the verge of their brief ascendancy (about 1475–1515) the Swiss armed as much as one quarter of their troops with it. The use of firearms made little or no progress amongst them, and the Swiss mercenaries of 1480, like their forerunners of Morgarten and Sempach, fought with the *arme blanche* alone. But in a very few years after the Swiss nation had become soldiers of fortune *en masse*, the more open lands of Swabia entered into serious and bitter competition with them. From these lands came the Landsknechts, whose order was as strong as, and far less unwieldy than, that of the Swiss, whose armament included a far greater proportion of firearms, and who established a regimental system that left a permanent mark on army organization. The Landsknecht was the prototype of the infantryman of the 16th and 17th centuries, but his right to indicate the line of evolution had to be wrung from many rivals.

The long pike.

The year 1480 indeed was a turning-point in military history. Within the three years preceding it the battles of Nancy and Guinegate had destroyed both the old feudalism of Charles the Bold and the new cavalry tactics of the French gendarmerie. The former was an anachronism, while the latter, when the great wars came to an end and there was no longer either a national impulse or a national leader, had lapsed into the old vices of ransom and plunder. With these, on the same fields, the *franc-archer* system of infantry tactics perished ignominiously. It rested, as we know, on the principle that the fire of the infantry was to be combined with and completed by the shock of the gendarmerie, and when the latter were found wanting as at Guinegate, the masses of archers and arblasters, which were only feebly supported by a few handfuls of pikemen and halberdiers, were swept away by the charge of some heavy battalions of Swabian and Flemish pikes. Guinegate was the *début* of the Landsknecht infantry as Nancy was that of the Swiss, and the lesson could not be misread. Louis XI. indeed hanged some of his *franc-archers* and dismissed the rest, and in their place raised " bands " of regular infantry, one of which bore for the first time the historic name of *Picardie*. But these " bands " were not self-contained. Armed for the most part with *armes de jel* they centred on the 6000 Swiss pikemen whom Louis XI., in 1480, took into his service, and for nearly fifty years thereafter the French foot armies are always composed of two elements, the huge battalions of Swiss or Landsknechts,[1] armed exclusively with the long pike (except for an ever-decreasing proportion of halberts, and a few arquebuses), and for their support and assistance, French and mercenary " bands."

The Italian wars of 1494–1544, in which the principles of fire and shock were readjusted to meet the conditions created by firearms, were the nursery of modern infantry. The combinations of Swiss, Landsknechts, Spanish " tercios " and French " bands " that figured on the battlefields of the early 16th century were infinitely various. But it is not difficult to find a thread that runs through the whole.

The Italian Wars, 1494-1525.

The essence of the Swiss system was solidity. They arrayed themselves in huge oblongs of 5000 men and more, at the corners of which, like the tower bastions of a 16th-century fortress, stood small groups of arquebusiers. The Landsknechts and the Romagnols of Italy, imitated and rivalled them, though as a rule developing more front and less depth. At this stage solidity was everything and fire-power nothing. At Fornuovo (1495) the mass of arquebusiers and arblasters in the French army did little or nothing; it was the Swiss who were *l'espérance de l'ost*. At Agnadello or Vailá in 1509 the ground and the " encounter-battle " character of the engagement gave special chances of effective employment to the arquebusiers on either side. Along the front the Venetian marksmen, secure behind a bank, picked off the leaders of the enemy as they came near. On the outer flank of the battle the bands of Gascon arquebusiers, which would otherwise have been relegated to an unimportant place in the general line of battle, lapped round the enemy's flank in broken ground and produced great and almost decisive effect. But this was only an afterthought of the king of France and Bayard. In the rest of the battle the huge masses of Swiss pikes were thrown upon the enemy much as the old feudal cavalry had been, regardless of ditches, orchards and vineyards.

Then for a moment the problem was solved, or partially solved, by the artillery. From Germany the material, though not—at least to the same extent—the principle, of the *wagenburg* penetrated, in the first years of the 16th century, to Italy and thence to France. Thus by degrees a very numerous and exceedingly handy light artillery—" carts with gonnes," as they were called in England—came into play on the Italian battlefields, and took over from the dying *franc-archer* system the work of preparing the assault by fire. For mere skirmishing the Swiss and Landsknechts had arquebusiers enough, without needing to call on the masses of Gascons, &c., and *pari passu* with the development of this artillery, the " bands," other than Swiss and Landsknechts, began to improve themselves into pikemen and halberdiers. At Ravenna (1512) the bands of Gascony and Picardy, as well as the French *aventuriers* (the " bands of Piedmont," afterwards the second senior regiment of the French line) fought in the line of battle shoulder to shoulder with the Landsknechts. On this day the fire action of the new artillery was extraordinarily murderous, ploughing lanes in the immobile masses of infantry. At Marignan the French gendarmerie and artillery, closely and skilfully combined, practically destroyed the huge masses of the Swiss, and so completely had " infantry " and " fire " become separate ideas that on the third day of this tremendous battle we find even the " bands of Piedmont " cutting their way into the Swiss masses.

The Spanish infantry and the arquebus.

But from this point the lead fell into the hands of the Spaniards. These were originally swift and handy light infantry, capable—like the Scottish Highlanders at Prestonpans and Falkirk long afterwards—of sliding under the forest of pikes and breaking into the close-locked ranks with buckler and stabbing sword. For troops of this sort the arquebus was an ideal weapon, and the problem of self-contained infantry was solved by Gonsalvo de Cordoba, Pescara and the great Spanish captains of the day by intercalating small closed bodies of arquebusiers with rather larger, but not inordinately large, bodies of pikes. These arquebusiers formed separate, fully organized sections of the infantry regiment. In close defence they fought on the front and flanks of the pikes, but more usually they were pushed well to the front independently, their speed and excellent fire discipline enabling them to do what was wholly beyond the power of the older type of firing infantry—to take advantage of ground, to run out and reopen fire during a momentary pause in the battle of lance and pike, and to run back to the shelter of their own closed masses when threatened by an oncoming charge. When this system of tactics was consecrated by the glorious success of Pavia (1525), the " cart with gonnes " vanished and the system of fighting everywhere and always " at push of pike " fell into the background.

16th Century tactics.

The lessons of Pavia can be read in Francis I.'s instructions to his newly formed Provincial (militia) Legions in 1534 and in the battle of Cerisoles ten years later. The " legion " was ordered to be composed of six " bands "—battalions we should call them now, but in those days the term " battalion " was consecrated to a gigantic square of the Swiss type—each of 800 pikes (including a few halberts) and 200 arquebusiers. The pikes, 4800 strong, of each legion were grouped in one large battalion, and covered on the front and flanks by the 1200 arquebuses, the latter working in small and handy squads. These " legions " did not of course count as good troops, but their organization and equipment, designed deliberately in peace time, and not affected by the coming and going of soldiers of fortune, represent therefore the theoretically perfect type for the 16th century. Cerisoles represents the system in practice, with veteran regular troops. On the side of the French most of the arquebuses were grouped on the right wing, in a long irregular line of companies or strong squads, supported at a moderate distance by companies or small battalions of " corselets " (pikes of the French bands of Picardy and Piedmont); the rest of the line of battle was composed of Landsknechts, &c., similarly arrayed, except that the arquebusiers were on the flanks and immediate front of the " corselets " and behind

[1] The term *landsknecht*, it appears, was not confined to the right bank of the Rhine. The French " lansquenets " came largely from Alsace, according to General Hardy de Perini. In the Italian wars Francis I. had in his service a famous corps called the " black bands " which was recruited in the lower Rhine countries.

the arquebuses and corselets of the right wing came a Swiss monster of the old type. On the imperial side of the Landsknechts, Spanish and Italian infantry were drawn up in seven or eight battalions, each with its due proportion of pikes and "shot." The course of the battle demonstrated both the active tactical power of the new form of fire-action and the solidity of the pike nucleus, the former in the attack and defence of hills, woods and localities, the latter in an episode in which a Spanish battalion, after being ridden through from corner to corner by the French gendarmes, continued on its way almost unchecked and quite unbroken. This combination of arquebusiers supported by corselets in first line and corselets with a few arquebusiers in second, reappeared at Renty (1554), and St Quentin (1557), and was in fact the typical disposition of infantry from about 1530 to 1600.

By 1550, then, infantry had entirely ceased to be an auxiliary arm. It contained within itself, and (what is more important) within its regimental units, the power of fighting effectively and decisively both at close quarters and at a distance—the principal characteristic of the arm to-day. It had, further, developed a permanent regimental existence, both in Spain and in France, and in the former country it had progressed so far from the "residue" state that young nobles preferred to trail a pike in the ranks of the foot to service in the gendarmerie or light horse. The service battalions were kept up to war strength by the establishment of depots and the preliminary training there of recruits. In France, apart from Picardie and the other old regiments, every temporary regiment, on disbandment, threw off a depot company of the best soldiers, on which nucleus the regiment was reconstituted for the next campaign. Moreover, the permanent establishment was augmented from time to time by the colonel-general of the foot "giving his white flag" to temporary regiments.

The French infantry in 1570.

The organization of the French infantry in 1570 presents some points of interest. The former broad classification of *au delà* and *en deça des monts* or "Picardie" and "Piedmont," representing the home and Italian armies, had disappeared, and instead the whole of the infantry, under one colonel-general, was divided into the regiments of Picardie, Piedmont and French Guards, each of which had its own colonel and its own colours. Besides these, three newer corps were *entretenus par le Roy*—"Champagne," practically belonging to the Guise[1] family, and two others formed out of the once enormous regiment of Marshal de Cossé-Brissac. At the end of a campaign all temporary regiments were disbanded, but in imitation of the Spanish depot system, each, on disbandment, threw off a depot company of picked men who formed the nucleus for the next year's augmentation. The regiment consisted of 10-16 "ensigns" or companies, each of about 150 pikemen and 50 arquebusiers. Each company had a proprietary captain, the owners of the first two companies being the colonel-general and the colonel (*mestre de camp*). The senior captain was called the sergeant-major, and performed the duties of a second in command and an adjutant or brigade-major. Unlike the regimental commander, the sergeant-major was always mounted, and it is recorded that one officer newly appointed to the post incurred the ridicule of the army by dismounting to speak to the king! "Some veteran officers," wrote a contemporary, "are inclined to think that the regimental commander should be mounted as well as the sergeant-major." The regiment was as a rule formed for parade and battle either in line 10 deep or in "battalion" (*i.e.* mass), Swiss fashion. The captain occupied the front, the ensigns with the company colours the centre, and the lieutenants the rear place in the file. The sergeants, armed with the halbert, marched on each side of the battalion or company. Though the musket was gradually being introduced, and had powerful advocates in Marshal Strozzi and the duke of Guise, the bulk of the "shot" still carried the arquebus, the calibre of which had been, thanks to Strozzi's efforts, standardized (see CALIVER) so that all the arms took the same sizes of ball. The pikeman had half-armour and a 14-ft. pike, the arquebusier beside the fire-arm a sword which he was trained to use in the manner of the former Spanish light infantry. The arquebusiers were arrayed in 3 ranks in front of the pikes or in 10 deep files on either flank.

The wars in which this system was evolved were wars for prestige and aggrandizement. They were waged, therefore, by mercenary soldiers, whose main object was to live, and who were officered either by men of their own stamp, or by nobles eager to win military glory. But the Wars of Religion raised questions of life and death for the Frenchmen of either faith, and such public opinion as there was influenced the method of operations so far that a decision and not a prolongation of the struggle began to be the desired end of operations. Hence in those wars the relatively immobile "battalion" of pikes diminishes in importance and the arquebusiers and musketeers grow more and more efficient. Armies, too, became smaller, and marched more rapidly. Encounter-battles became more frequent than "pitched" battles, and in these the musketeer was at a great advantage. Thus by 1600 the proportions between pikes and musketeers in the French army had come to be 6 pikes to 4 muskets or arquebuses, and the *bataillon de combat* or brigade was normally no more than 1200 strong. In the Netherlands, however, the war of consciences was fought out between the best regular army in the world and burgher militias. Even the French *fantassins* were second in importance to the Spanish *soldados*. The latter continued to hold the pre-eminent position they had gained at Pavia.[2] They improved the arquebus into the musket, a heavier and much more powerful weapon (fired from a rest) which could disable a horse at 500 paces.

Alva.

At this moment the professional soldier was at the high-water mark of his supremacy. The musket was too complicated to be rapidly and efficiently used by any but a highly trained man; the pike, probably because it had now to protect two or three ranks of "shot" in front of the leading rank of pikemen, as well as the pikemen themselves, had grown longer (up to 18 ft.); and drill and manœuvre had become more important than ever, for in the meantime cavalry had mostly abandoned the massive armour and the long lance in favour of half-armour and the pistol, and their new tactics made them both swifter to charge groups of musketeers and more deadly to the solid masses of pikemen. This superiority of the regular over the irregular was most conspicuously shown in Alva's war against the Netherlands patriots. Desperately as the latter fought, Spanish captains did not hesitate to attack patriot armies ten times their own strength. If once or twice this contempt led them to disaster, as at Heiligerlee in 1568 (though here, after all, Louis of Nassau's army was chiefly composed of trained mercenaries), the normal battle was of the Jemmingen type—seven *soldados* dead and seven thousand rebels.

As regards battles in the open field, such results as these naturally confirmed the "Spanish system" of tactics. The Dutch themselves, when they evolved reliable field armies, copied it with few modifications, and by degrees it was spread over Europe by the professional soldiers on both sides. There was plenty of discussion and readjustment of details. For example, the French, with their smaller battalions and more rapid movements, were inclined to disparage both the cuirass and the pike, and only unwillingly hampered themselves with the long heavy Spanish musket, which had to be fired from a rest. In 1600, nearly fifty years after the introduction of the musket, this most progressive army still deliberately preferred the old light arquebus, and only armed a few selected men with the larger weapons. On the other hand, the Spaniards, though supreme in the open, had for the most part to deal with desperate men behind fortifications. Fighting, therefore, chiefly at close quarters with a fierce enemy, and not disposing either of the space or of the opportunity for "manœuvre-battles," they sacrificed all their former lightness and speed, and clung to armour, the long pike and the heavy $2\frac{1}{2}$ oz. bullet. But the principles first put into practice by Gonsalvo de Cordoba, the combination, in the proportions required in each case, of *fire* and *shock* elements in every body of organized infantry however small, were maintained in full vigour, and by now the superiority of the infantry arm in method, discipline and technique, which had long before made the Spanish nobles proud to trail a pike in the ranks, began to impress itself on other nations. The relative value of horse and foot became a subject for expert

[1] This practice of "maintenance" on a large scale continued to exist in France long afterwards. As late as the battle of Lens (1648) we find figuring in the king of France's army three "regiments of the House of Condé."

[2] Even as late as 1645 a battalion of infantry in England was called a "tercio" or "tertia" (see ARMY; *Spanish army*).

discussion instead of an axiom of class pride. The question of cavalry *versus* infantry, hotly disputed in all ages, is a matter affecting general tactics, and does not come within the scope of the present article (see further CAVALRY). Expert opinion indeed was still on the side of the horsemen. It was on their cavalry, with its speed, its swords and its pistols that the armies of the 16th century relied in the main to produce the decision in battle. Sir Francis Vane, speaking of the battle of Nieupoort in 1600, says, "Whereas most commonly in battles the success of the foot dependeth on that of the horse, here it was clean contrary, for so long as the foot held good the horse could not be beaten out of the field." The "success" of the foot in Vane's eyes is clearly resistance to disintegration rather than ability to strike a decisive blow.

Infantry in 1600.

It must be remembered, however, that Vane is speaking of the Low Countries, and that in France at any rate the solidity which saved the day at Nieupoort was less appreciated than the *élan* which had won so many smart engagements in the Wars of Religion. Moreover, it was the *offensive*, the decision-compelling faculty of the foot that steadily developed during the 17th century. To this, little by little, the powers of passive resistance to which Vane did homage, valuable as they were, were sacrificed, until at last the long pike disappeared altogether and the firearm, provided with a bayonet, was the uniform weapon of the foot-soldier. This stage of infantry history covers almost exactly a century. As far as France was concerned, it was a natural evolution. But the acceptance of the principle by the rest of the military world, imposed by the genius of Gustavus Adolphus, was rather revolution than evolution.

Gustavus Adolphus.

In the army which Louis XIII. led against his revolted barons of Anjou in 1620, the old regiments (*les vieux*—Picardie, Piedmont, &c.) seem to have marched in an open chequer-wise formation of companies which is interesting not only as a deliberate imitation of the Roman legion (all soldiers of that time, in the prevailing confusion of tactical ideas, sought guidance in the works of Xenophon, Aelian and Vegetius), but as showing that flexibility and handiness was not the monopoly of the Swedish system that was soon to captivate military Europe. The formations themselves are indeed found in the Spanish and Dutch armies, but the equipment of the men, and the general character of the operations in which they were engaged, probably failed to show off the advantages of this articulation, for the generals of the Thirty Years' War, trained in this school, formed their infantry into large battalions (generally a single line of masses). Experience certainly gave the troops that used these unwieldy formations a relatively high manœuvring capacity, for Tilly's army at Breitenfeld (1631) "changed front half-left" in the course of the battle itself. But the manœuvring power of the Swedes was higher still. Each party represented one side of the classical revival, the Swedes the Roman three-line manipular tactics, the Imperialists and Leaguers those of the Greek line of phalanxes. The former, depending as it did on high *moral* in the individual foot-soldier, was hardly suitable to such a congeries of mercenaries as those that Wallenstein commanded, and later in the Thirty Years' War, when the old native Swedish and Scottish brigades had been annihilated, the Swedish infantry was little if at all better than the rest.

But its tactical system, sanctified by victory, was eagerly caught up by military Europe. The musket, though it had finally driven out the arquebus, had been lightened by Gustavus Adolphus so far that it could be fired without a rest. Rapidity in loading had so far improved that a company could safely be formed six deep instead of ten, as in the Spanish and Dutch systems. Its fire power was further augmented by the addition of two very light field-guns to each battalion; these could inflict loss at twice the effective range of the shortened musket. Above all, Gustavus introduced into the military systems of Europe a new discipline based on the idea of exact performance of duty, which made itself felt in every part of the service, and was a welcome substitute for the former easy-going methods of regimental existence.[1] The adoption of Swedish methods indeed was facilitated by the disrepute into which the older systems had fallen. Men were beginning to see that armies raised by contract for a few months' work possessed inherent vices that made it impossible to rely upon them in small things. Courage the mercenary certainly possessed, but his individual sense of honour, code of soldierly morals, and sometimes devotion to a particular leader did not compensate for the absence of a strong motive for victory and for his general refractoriness in matters of detail, such as march-discipline and punctuality, which had become essential since the great Swedish king had reintroduced order, method and definiteness of purpose into the conduct of military operations. In the old-fashioned masses, moreover, individual weaknesses, both moral and physical, counted for little or were suppressed in the general soldierly feeling of the whole body. But the six-deep line used by Gustavus demanded more devotion and exact obedience in the individual and a more uniform method of drill and handling arms. So shallow an order was not strong enough, under any other conditions, to resist the shock of cavalry or even of pikemen. Indeed, had not the cavalry (who, after Gustavus's death, were uninspired mercenaries like the rest) ceased to charge home in the fashion that Gustavus exacted of them, it is possible that the new-fashioned line would not have stood the test, and that infantry would have reverted to the early 16th-century type.

The Great Rebellion.

The problem of combining the maximum of fire power with the maximum of control over the individual firer was not fully solved until 1740, but the necessity of attempting the problem was realised from the first. In the Swedish army, before it was corrupted by the atmosphere of the Thirty Years' War, duty to God and to country were the springs of the punctual discipline, in small things and in great, which made it the most formidable army, unit for unit, in the world. In the English Civil War (in which the adherents of the "Swedish system" from the first ousted those of the "Dutch") the difficulty was more acute, for although the mainsprings of action were similar, the technical side of the soldier's business—the regimental organization, drill and handling of arms—had all to be improvised. Now in the beginning the Royalist cavalry was recruited from "gentlemen that have honour and courage and resolution"; later, Cromwell raised a cavalry force that was even more thoroughly imbued with the spirit of duty, "men who made some conscience of what they did," and throughout the Civil War, consequently, the mounted arm was the queen of the battlefield.

The Parliamentary foot too "made some conscience of what it did," more especially in the first years of the war. But its best elements—the drilled townsmen—were rather of a defensive than of an offensive character, and towards the close of the struggle, when the foot on both sides came to be formed of professional soldiers, the defensive element decreased, as it had decreased in France and elsewhere. The war was like Gustavus's German campaign, one of rapid and far-ranging marches, and the armoured pikeman had either to shorten his pike and to cast off his armour or to be left at home with the heavy artillery (see Firth's *Cromwell's Army*, ch. iv.). Fights "at push of pike" were rare enough to be specially mentioned in reports of battles. Sir James Turner says that in 1657, when he was commissioned with others to raise regiments for the king of Denmark, "those of the Privy Council would not suffer one word to be mentioned of a pike in our Commissions." It was the same with armour. In 1658 Lockhart, the commander of the English contingent in France, specially asked for a supply of cuirasses and headpieces for his pikemen in order to impress his allies. In 1671 Sir James Turner says, "When we see battalions of pikes, we see them everywhere naked unless it be in the Netherlands." But a small proportion of pikes was still held to be necessary by experienced soldiers, for as yet the socket bayonet had not been invented, and there was still cavalry in Europe that could be trusted to ride home.

[1] In France it is recorded that the *Gardes françaises*, when warned for duty at the Louvre, used to stroll thither in twos and threes.

While such cavalry existed, the development of fire power was everywhere hindered by the necessity of self-defence. On the other hand the hitherto accepted defensive means militated against efficiency in many ways, and about 1670, when Louis XIV. and Louvois were fashioning the new standing army that was for fifty years the model for Europe, the problem was how to improve the drill and efficiency of the musketeers so far that the pikes could be reduced to a minimum. In 1680 the firelock was issued instead of the matchlock to all grenadiers and to the four best shots in each French Company. The bayonet—in its primitive form merely a dagger that was fixed into the muzzle of the musket—was also introduced, and the pike was shortened. The proportion of pikes to muskets in Henry IV.'s day, 2 to 1 or 3 to 2, and in Gustavus's 2 to 3, had now fallen to 1 to 3.

Disuse of the pike.

The day of great causes that could inspire the average man with the resolution to conquer or die was, however, past, and the "shallow order" (*l'ordre mince*), with all its demands on the individual's sense of duty, had become an integral part of the military system. How then was the sense of duty to be created? Louis and Louvois and their contemporaries sought to create it by taking raw recruits in batches, giving them a consistent training, quartering them in barracks and uniforming them. Henceforward the soldier was not a unit, self-taught and free to enter the service of any master. He had no existence as a soldier apart from his regiment, and within it he was taught that the regiment was everything and the individual nothing. Thus by degrees the idea of implicit obedience to orders and of *esprit de corps* was absorbed. But the self-respecting Englishman or the quick ardent Frenchman was not the best raw material for quasi-automatic regiments, and it was not until an infinitely more rigorous system of discipline was applied to an unimaginative army that the full possibilities of this enforced sense of duty were realized.

Methods of fire before 1740.

The method of delivering fire originally used by the Spaniards, in which each man in succession fired and fell back to the rear of the file to reload, required for its continued and exact performance a degree of coolness and individual smartness which was probably rarely attained in practice. This was not of serious moment when the "shot" were simple auxiliaries, but when under Gustavus the offensive idea came to the front, and the bullets of the infantry were expected to do something more than merely annoy the hostile pikemen, a more effective method had to be devised. First, the handiness of the musket was so far improved that one man could reload while five, instead of as formerly ten, fired. Then, as the enhanced rate of fire made the file-firing still more disorderly than before, two ranks and three were set to fire "volews" or "salvees" together, and before 1640 it had become the general custom for the musketeers to fire one or two volleys and then, along with the pikemen, to "fall on." It was of course no mean task to charge even a disordered mass of pikes with a short sword or a clubbed musket, and usually after a few minutes the combatants would drift apart and the musketeers on either side would keep up an irregular fire until the officers urged the whole forward for a second attempt.

The bayonet.

With the general disuse of the lance, the disappearance of the personal motives that formerly made the cavalryman charge home, the adoption of the flintlock musket and the invention of the socket bayonet (the fixing of which did not prevent fire being delivered), all reason for retaining the pike vanished, and from about 1700 to the present day, therefore, the invariable armament of infantry has been the musket (or rifle) and bayonet. The manner of employing the weapons, however, changed but slowly. In the French army in 1688, for instance (15 years before the abolition of the pike), the old file-fire was still officially recognized, though rarely employed, the more usual method being for the musketeers in groups of 12 to 30 men to advance to the front and deliver their volleys in turn, these groups corresponding in size to one of the musketeer wings (*manches*) of a company or double company. But the fire and shock action of infantry were still distinct, the idea of "push of pike" remained, the bayonet (as at Marsaglia) taking the place of the pike, and musketry methods were still and throughout the War of the Spanish Succession somewhat half-hearted and tentative. Two generals so entirely different in genius and temperament as Saxe and Catinat could agree on this point, that attacking infantry ought to close with the enemy, bayonets fixed, without firing a shot. Catinat's orders to his army in 1690, indeed, seem rather to indicate that he expected his troops to endure the enemy's first fire without replying in order that their own volley, when it was at last delivered at a few paces distance, should be as murderous as possible, while Saxe, who was a dreamer as well as a practical commander of troops, advocated the pure bayonet charge. But the fact that is common to both is the relative ineffectiveness of musketry before the Prussian era, whether this musketry was delivered by groups of men running forward and returning in line or even by companies in a long line of battle.

This ineffectiveness was due chiefly to the fact that *fire* and *movement* were separate matters. The enemy's volley, that Catinat and others ordered their troops to endure without flinching, was sometimes (as at Fontenoy) absolutely crushing. But as a rule it inflicted an amount of loss that was not sufficient to put the advancing troops out of action, and experienced officers were aware that to halt to reply gave the enemy time to reload, and that once the fight became an interchange of partial and occasional volleys or a general *tiraillerie*, there was an end to the attack.

Linear tactics.

Meanwhile, the tactics of armies had been steadily crystallizing into the so-called "linear" form, which, as far as concerns the infantry, is simply two long lines of battalions (three, four or five deep) and gave the utmost possible development to fire-power. The object of the "line" was to break or beat down the opposing line in the shortest possible time, whether by fire action or shock action, but fire action was only decisive at so short a range that the principal volley could be followed immediately by a charge over a few score paces at most and the crossing of bayonets. Fire was, however, effective at ranges outside charging distance, especially from the battalion guns, and however the decision was achieved in the end, it was necessary to cross the zone between about 300 yds. and 50 yds. range as quickly as possible. It was therefore the business of the regimental officer to force his men across this zone before fire was opened. If, as Catinat recommended, decisive range was reached with every musket loaded and the troops well in hand, their fire when finally it was delivered might well be decisive. But in practice this rarely happened, and though here and there such expedients as a skirmishing line were employed to assist the advance by disturbing the enemy's fire the most that was hoped by the average colonel or captain was that in the advance fire should be opened as late as possible and that the officers should strive to keep in their hands the power of breaking off the fire-fight and pushing the troops forward again. Theorists were already proposing column formations for shock action, and initiating the long controversy between *l'ordre mince* and *l'ordre profonde*, but this was for the time being pure speculation. The linear system rested on the principle that the maximum weight of controlled fire at short range was decisive, and the practical problem of infantry tactics was how to obtain this. The question of *fire versus shock* had been answered in favour of the former, and henceforward for many years the question of *fire versus movement* held the first place. The purpose was settled, and it remained to discover the means.

This means was Prussian fire-discipline, which was elaborated by Leopold of Dessau and Frederick William I., and practically applied by Frederick the Great. It consisted first in the combination, instead of the alternation, of fire and movement, and secondly in the thorough efficiency of the fire in itself. But both these demanded a more stringent and technically more perfect drill than had ever before been imagined, or, for that matter, has ever since been attained. A hundred years before the steady drill of the Spanish veterans at Rocroi, who at the word of command opened their ranks to let the cannon fire from the rear and again closed them, impressed every soldier in Europe. But such drill as this was child's play compared with the Old Dessauer's.

Prussian fire discipline, 1740.

On approaching the enemy the marching columns of the Prussians, which were generally open columns of companies 4 deep, wheeled in succession to the right or left (almost always to the right) and thus passed along the front of the enemy at a distance of 800-1200 yds. until the rear company had wheeled. Then the whole together (or in the case of a deployment to the left, in succession) wheeled into line facing the enemy. These movements, if intervals and distances were preserved with proper precision, brought the infantry into two long well-closed lines, and parade-ground precision was actually attained, thanks to remorseless drilling and to the reintroduction of the march in step to music. Of course such movements were best executed on a firm plain, and as far as possible the attack and defence of woods and villages was left to light infantry and grenadiers. But even in marshes and scrub, the line managed to manœuvre with some approach to the precision of the barrack square.[1] Now, this precision allowed Frederick to take risks that no former commander would have dared to take. At Hohenfriedberg the infantry columns crossed a marshy stream almost within cannon shot of the enemy; at Kolin (though there this insolence was punished) the army filed past the Imperialist skirmishers within less than musket shot, and the climax of this daring was the "oblique order" attack of Leuthen. With this was bound up a fire discipline that was more extraordinary than any perfection of manœuvre. Before Hohenfriedberg the king gave orders that "pelotonfeuer" was to be opened at 200 paces from the enemy and continued up to 30 paces, when the line was to fall on with the bayonet. The possibility of this combination of fire and movement was the work of Leopold, who gave the Prussian infantry iron ramrods, and by sheer drill made the soldier a machine capable of delivering (with the flintlock muzzle-loading muskets, be it observed) five volleys a minute. This *pelotonfeuer* or company volleys replaced the old fire by ranks practised in other armies. Fire began from the flanks of the battalion, which consisted of eight companies (for firing, 3 deep). When the right company commander gave "fire," the commander of No. 2 gave "ready," followed in turn by other companies up to the centre. The same process having been gone through on the left flank, by the time the two centre companies had fired the two flank companies were ready to recommence, and thus a continuous series of rolling volleys was delivered, at one or two seconds' interval only between companies. In attack this fire was combined with movement, each company in turn advancing a few paces after "making ready." In square, old-fashioned methods of fire were employed. Square was an indecisive and defensive formation, rarely used, and in the advance of the deployed line, the offensive and decision-seeking formation *par excellence*, the special Prussian fire-discipline gave Frederick an advantage of five shots to two against all opponents. The bayonet-attack, if the rolling volleys had done their work, was merely "presenting the cheque for payment" as a modern German writer puts it. The cheque had been drawn, the decision given, in the fire-fight.

Leuthen.

For some years this method of infantry training gave the Prussians a decisive superiority in whatever order they fought. But their enemies improved and also grew in numbers, while the Prussian army's resources were strictly limited. Thus in the Seven Years' War, after the two costly battles of Prague and Kolin (1757) especially, it became necessary to manœuvre with the object of bringing the Prussian infantry into contact with an equal or if possible smaller portion of the enemy's line. If this could be achieved, victory was as certain as ever, but the difficulties of bringing about a successful manœuvre were such that the classical "oblique order" attack was only once completely executed. This was at Leuthen, December 5th, 1757, perhaps the greatest day in the history of the Prussian army. Here, in a rolling plain country occasionally broken by marshes and villages, the "oblique order" was executed at high speed and with clockwork precision. Frederick's object was to destroy the left of the Austrian army (which far outnumbered his own) before the rest of their deployed line of battle could change front to intervene. His method was to place his own line, by a concealed flank march, opposite the point where he desired to strike, and then to advance, not in two long lines but in échelon of battalions from the right (see Leuthen). The échelon was not so deep but that each battalion was properly supported by the following one on its left (100 paces distance), and each, as it came within 200 yds. of the Austrian battalion facing it, opened its "rolling volleys" while continuing to advance; thus long before the left and most backward battalions were committed to the fight, the right battalions were crumbling the Austrian infantry units one by one from left to right. It was the same, without parade manœuvres, when at last the Austrians managed to organize a line of defence about Leuthen village. Unable to make an elaborate change of front with the whole centre and right wing for want of time, they could do no more than crowd troops about Leuthen, on a short fighting front, and this crumbled in turn before the Prussian volleys.

One lesson of Leuthen that contemporary soldiers took to heart was that even a two-to-one superiority in numbers could not remedy want of manœuvring capacity. It might be hoped that with training and drill an Austrian battalion could be made equal to a Prussian one in the front-to-front fight, and in fact, as losses told more and more heavily on Frederick's army as years went on, the specific superiority of his infantry disappeared. From 1758 therefore, to the end of the war, there were no more Rossbachs and Leuthens. Superiority in efficiency through previous training having exhausted its influence, superiority in force through manœuvre began to be the general's ideal, and as it was a more familiar notion to the average Prussian general, trained to manœuvre, than to his opponent, whose idea of "manœuvre" was to sidle carefully from one *position* to another, Prussian generalship maintained its superiority, in spite of many reverses, to the end. The last campaigns were indeed a war of positions, because Frederick had no longer the men available for forcing the Austrians out of them, and on many occasions he was so weak that the most passive defensive and the most elaborate entrenchments barely sufficed to save him. But whenever opportunity offered itself, the king sought a decisive success by bringing the whole of his infantry against part of the enemy's—the principle of Leuthen put in practice over a wider area and with more elastic manœuvre methods. The long échelon of battalions directed against a part of the hostile line developed quite naturally into an irregular échelon of brigade columns directed against a part of the enemy's position. But the history of the "cordon system" which followed this development belongs rather to the subject of tactics in general than to that of infantry fighting methods. Within the unit the tactical method scarcely varied. In a battle each battalion or brigade fought as a unit in line, using company volleys and seeking the decision by fire.

Controversies and developments, 1760-1790.

In this, and in even the most minute details of drill and uniform, military Europe slavishly copied Prussia for twenty years after the Seven Years' War. The services of ex-Prussian officers were at a premium just as those of Gustavus's officers had been 150 years before. Military missions from all countries went to Potsdam or to the "Reviews" to study Prussian methods, with as simple a faith in their adequacy as that shown to-day by small states and half-civilized kingdoms who send military representatives to serve in the great European armies. And withal, the period 1763–1792 is full of tactical and strategical controversies. The principal of these, as regards infantry, was that between "fire" and "shock" revived about 1710 by Folard, and about 1780 the American War of Independence complicated it by introducing a fresh controversy between *skirmishing* and *close order*. As to the first, in Folard's day as in Frederick's, fire action at close range was the deciding factor in battle, but in Frederick's later campaigns, wherein he no longer disposed of the old Prussian infantry and its swift mechanical fire-discipline, there sprang up a tendency to trust to the bayonet for the decision. If the (so-called) Prussian infantry of 1762 could be in any way brought to close with the enemy, it had a fair chance of victory owing to its leaders' previous dispositions, and then the advocates of "shock," who had temporarily been silenced by Mollwitz and Hohenfriedberg, again took courage. The ordinary line was primarily a formation for fire, and only secondarily or by the accident of circumstances for shock, and, chiefly perhaps under Saxe's influence, the French army had for many years been accustomed to differentiate between "linear" formations for fire and "columnar" for attack—thus reverting to 16th-century practice. While, therefore, the theoreticians pleaded for battalion columns and the bayonet or for line and the bullet, the practical soldier used both. Many forms of combined line and column were tried, but in France, where the question was most assiduously studied, no agreement had been arrived at when the advent of the skirmisher further complicated the issues.

In the early Silesian wars, when armies fought in open country in linear order, the outpost service scarcely concerned the line troops sufficiently to cause them to get under arms at the sound of firing on the sentry line. It was performed by irregular light troops, recruited from wild characters of all nations, who were also charged with the preliminary skirmishing necessary to clear up the situation before

[1] About this time there was introduced, for resisting cavalry, the well-known hollow battalion square, which, replacing the former masses of pikes, represented up to the most modern times the defensive, as the line or column represented the offensive formation of infantry.

the deployment of the battle-army, but once the line opened fire their work was done and they cleared away to the flanks (generally in search of plunder). Later, however, as the preliminary manœuvring before the battle grew in importance and the ground taken into the manœuvring zone was more varied and extended than formerly, light infantry was more and more in demand—in a "cordon" defensive for patrolling the intervals between the various detachments of line troops, in an attack for clearing the way for the deployment of each column. Yet in all this there was no suggestion that light troops or skirmishers were capable of bringing about the decision in an armed conflict. When Frederick gained a durable peace in 1763 he dismissed his "free battalions" without mercy, and by 1764 not more than one Prussian soldier in eleven was an "irregular," either of horse or foot.[1]

Light infantry.

But in the American War of Independence the line was pitted against light infantry in difficult country, and the British and French officers who served in it returned to Europe full of enthusiasm for the latter. Nevertheless, their light infantry was, unlike Frederick's, *selected line infantry*. The light infantry duties—skirmishing, reconnaissance, outposts—were grafted on to a thorough close-order training. At first these duties fell to the grenadiers and light companies of each battalion, but during the struggle in the colonies, the light companies of a brigade were so frequently massed in one battalion that in the end whole regiments were converted into light infantry. This combination of "line" steadiness and "skirmisher" freedom was the keynote of Sir John Moore's training system fifteen years later, and Moore's regiments, above all the 52nd, 43rd (now combined as the Oxfordshire Light Infantry) and 95th Rifles (Rifle Brigade), were the backbone of the British Army throughout the Peninsular War. At Waterloo the 52nd, changing front in line at the double, flung itself on the head and flank of the Old Guard infantry, and with the "rolling volleys" inherited from the Seven Years' War, shattered it in a few minutes. Such an exploit would have been absolutely inconceivable in the case of one of the old "free battalions." But the light infantry had not merely been levelled up to the line, it had surpassed it, and in 1815 there were no troops in Europe, whether trained to fight in line or column or skirmishers, who could rival the three regiments named, the "Light Division" of Peninsular annals. For meantime the infantry organization and tactics of the old régime, elsewhere than in England, had been disintegrated by the flames of the French Revolution, and from their ashes a new system had arisen, which forms the real starting-point of the infantry tactics of to-day.

The French Revolution.

The controversialists of Louis XVI.'s time, foremost of whom were Guibert, Joly de Maizeroy and Menil Durand (see Max Jähns, *Gesch. d. Kriegswissenschaften*, vol. iii.), were agreed that shock action should be the work of troops formed in column, but as to the results to be expected from shock action, the extent to which it should be facilitated by a previous fire preparation, and the formations in which fire should be delivered (line, line with skirmishers or "swarms") discussion was so warm that it sometimes led to wrangles in ladies' drawing-rooms and meetings in the duelling field. The drill-book for the French infantry issued shortly before the Revolution was a common-sense compromise, which in the main adhered to the Frederician system as modified by Guibert, but gave an important place in infantry tactics to the battalion "columns of attack," that had hitherto appeared only spasmodically on the battlefields of the French army and never elsewhere. This, however, and the quick march (100 paces to the minute instead of the Frederician 75) were the only prescriptions in the drill-book that survived the test of a "national" war, to which within a few years it was subjected (see French Revolutionary Wars). The rest, like the "linear system" of organization and manœuvre to which it belonged (see Army, §§ 30-33; Conscription, &c.) was ignored, and circumstances and the practical troop-leaders evolved by circumstances fashioned the combination of *close-order columns and loose-order skirmishers* which constituted essentially the new tactics of the Revolutionary and Napoleonic infantry.

The process of evolution cannot be stated in exact terms, more especially as the officers, as they grew in wisdom through experience, learned to apply each form in accordance with ground and circumstances, and to reject, when unsuitable, not only the forms of the drill-book, but the forms proposed by themselves to replace those of the drill-book. But certain tendencies are easily discernible. The first tendency was towards the dissolution of all tactical links. The earlier battles were fought partly in line for fire action, partly in columns for the bayonet attack. Now the linear tactics depended on exact preservation of dressing, intervals and distances, and what required in the case of the Prussians years of steady drill at 76 paces to the minute was hardly attainable with the newly levied ardent Frenchmen marching at 100 to 120. Once, therefore, the line moved, it broke up into an irregular swarm of excited firers, and experience soon proved that only the troops kept out of the turmoil, whether in line or in column, were susceptible of manœuvre and united action. Thus from about 1795 onwards the forms of the old régime, with half the troops in front in line of battle (practically in dense hordes of firers) and the other half in rear in line or line of columns, give way to new ones in which the skirmishers are fewer and the closed troops more numerous, and the decision rests no longer with the fire of the leading units (which of course could not compare in effectiveness with the rolling volleys of the drilled line) but with the bayonets of the second and third lines—the latter being sometimes in line but more often, owing to the want of preliminary drill, in columns. The skirmishers tended again to become pure light infantry, whose rôle was to prepare, not to give, the decision, and who fought in a thin line, taking every advantage of cover and marksmanship. In the Consulate and early Empire, indeed, we commonly find, in the closed troops destined for the attack, mixed line and column formations combining in themselves shock and controlled close-order fire—absolutely regardless of the skirmishers in front.

Tactical evolution in France 1792-1807.

In sum, then, from 1792 to 1795 the fighting methods of the French infantry, of which so much has been written and said, are, as they have aptly been called, "horde-tactics." From 1796 onwards to the first campaigns of the Empire, on the other hand, there is an ever-growing tendency to combine skirmishers, properly so called, with controlled and well-closed bodies in rear, the first to prepare the attack to the best of their ability by individual courage and skill at arms, the second to deliver it at the right moment (thanks to their retention of manœuvre formations), and with all possible energy (thanks to the cohesion, moral and material, which carried forward even the laggards). Even when in the long wars of the Empire the quality of the troops progressively deteriorated, infantry tactics within the regiment or brigade underwent no radical alteration. The actual formations were most varied, but they always contained two of the three elements, column, line and skirmishers. Column (generally two lines of battalions in columns of double-companies) was for shock or attack, line for fire-effect, and skirmishers to screen the advance, to scout the ground and to disturb the enemy's aim. Of these, except on the defensive (which was rare in a Napoleonic battle), the "column" of attack was by far the most important. The line formations for fire, with which it was often combined, rarely accounted for more than one-quarter of the brigade or division, while the skirmishers were still less numerous. Withal, these formations in themselves were merely fresh shapes for old ideas. The armament of Napoleon's troops was almost identical with that of Frederick's or Saxe's. Line, column and combinations of the two were as old as Fontenoy and were, moreover, destined to live for many years after Napoleon had fallen. "Horde-tactics" did not survive the earlier Revolutionary campaigns. Wherein then lies the change which makes 1792 rather than 1740 the starting-point of modern tactics?

Napoleon's infantry and artillery tactics, 1807-1815.

The answer, in so far as so comprehensive a question can be answered from a purely infantry standpoint, is that whereas Frederick, disposing of a small and highly finished instrument, used its manœuvre power and regimental efficiency to destroy one part of his enemy so swiftly that the other had no time to intervene, Napoleon, who had numbers rather than training on his side, only delivered his decisive blow after he had "fixed" all bodies of the enemy which would interfere with his preparations—*i.e.* had set up a physical barrier against the threatened intervention. This new idea manifested itself in various forms.

[1] The Prussian Grenadier battalions in the Silesian and Seven Years' Wars were more and more confined strictly to line-of-battle duties as the irregular light infantry developed in numbers.

In strategy (*q.v.*) and combined tactics it is generally for convenience called "economy of force." In the domain of artillery (see ARTILLERY) it marked a distinction, that has revived in the last twenty years, between slow disintegrating fire and sudden and overpowering "fire-preparation." As regards infantry the effect of it was revolutionary. Regiments and brigades were launched to the attack to compel the enemy to defend himself, and fought until completely dissolved to force him to use up his reserves. "On s'engage partout et puis l'on voit" is Napoleon's own description of his *holding attack*, which in no way resembled the "feints" of previous generations. The self-sacrifice of the men thus engaged enabled their commander to "see," and to mass his reserves opposite a selected point, while little by little the enemy was hypnotized by the fighting. Lastly, when "the battle was ripe" a hundred and more guns galloped into close range and practically annihilated a part of the defender's line. They were followed up by masses of reserve infantry, often more solidly formed at the outset than the old Swiss masses of the 16th century.[1] If the moment was rightly chosen these masses, dissolved though they soon were into dense formless crowds, penetrated the gap made by the guns (with their arms at the slope) and were quickly followed by cavalry divisions to complete the enemy's defeat. Here, too, it is to be observed there is no true shock. The infantry masses merely "present the cheque for payment," and apart from surprises, ambushes and fights in woods and villages there are few recorded cases of bayonets being crossed in these wars. Napoleon himself said "Le feu est tout, le reste peu de chose," and though a mere plan of his dispositions suggests that he was the disciple of Folard and Menil Durand, in reality he simply applied "fire-power" in the new and grander form which his own genius imagined.

The problem, then, was not what it had been one hundred and fifty years before. The business of the attack was not to break down the passive resistance of the defence, but to destroy or to evade its fire-power. No attack with the bayonet could succeed if this remained effective and unbroken, and no resistance (in the open field at least) availed when it had been mastered or evaded. In Napoleon's army, the circumstance that the infantry was (after 1807) incapable of carrying out its own fire-preparation forced the task into the hands of the field artillery. In other armies the 18th-century system had been discredited by repeated disasters, and the infantry, as it became "nationalized," was passing slowly through the successive phases of irregular lines, "swarms," skirmishers and line-and-column formations that the French Revolutionary armies had traversed before them—none of them methods that in themselves had given decisive results.

In all Europe the only infantry that represented the Frederician tradition and prepared its own charge by its own fire was the British. Eye-witnesses who served in the ranks of the French have described the sensation of powerlessness that they felt as their attacking column approached the line and watched it load and come to the present. The column stopped short, a few men cheered, others opened a ragged individual fire, and then came the volleys and the counter-attack that swept away the column. Sometimes this counter-stroke was made, as in the famous case of Busaco, from an apparently unoccupied ridge, for the British line, under Moore's guidance, had shaken off the Prussian stiffness, fought 2 deep instead of 3 and was able to take advantage of cover. The "blankness of the battlefield" noted by so many observers to-day in the South African and Manchurian Wars was fully as characteristic of Wellington's battles from Vimeiro to Waterloo, in spite of close order and red uniforms. But these battles were of the offensive-defensive type in the main, and for various reasons this type could not be accepted as normal by the rest of Europe. Nonchalance was not characteristic of the eager national levies of 1813 and 1814, and the Wellington method of infantry tactics, though it had brought about the failure of Napoleon's last effort, was still generally regarded as an illustration of the already recognized fact that on the defensive the fire-power of the line, unless partly or wholly evaded by rapidity in the advance and manœuvring power or mastered and extinguished by the fire-power of the attack, made the front of the defence impregnable. There was indeed nothing in the English tactics at Waterloo that, standing out from the incidents of the battle, offered a new principle of winning battles.

The British Peninsular Infantry.

Nor indeed did Europe at large desire a fresh era of warfare. Only the French, and a few unofficial students of war elsewhere, realized the significance of the rejuvenated "line." For every one else, the later Napoleonic battle was the model, and as the great wars had ended before the "national" spirit had been exhausted or misused in wars of aggrandizement, infantry tactics retained, in Germany, Austria and Russia, the characteristic Napoleonic formations, lines of battalion or regimental columns, sometimes combined with linear formations for fire, and always covered by skirmishers. That these columns must in action dissolve sooner or later into dense irregular swarms was of course foreseen, but Napoleon had accustomed the world to long and costly fire-fighting as the preliminary to the attack of the massed reserves, and for the short remainder of the period of smooth-bore muskets, troops were always launched to the attack in columns covered by a thin line of picked shots as skirmishers. The moral power of the offensive "will to conquer" and the rapidity of the attack itself were relied upon to evade and disconcert the fire-power of the defence. If the attack failed to do so, the ranges at which infantry fire was really destructive were so small that it was easy for the columns to deploy or disperse and open a fire-fight to prepare the way for the next line of columns. And after a careful study of the battle of the Alma, in which the British line won its last great victory in the open field, Moltke himself only proposed such modifications in the accepted tactical system as would admit of the troops being deployed for *defence* instead of meeting attack, as the Russians met it, in solid and almost stationary columns. Fire in the attack, in fact, had come to be considered as chiefly the work of artillery, and as artillery, being an expensive arm, had been reduced during the period of military stagnation following Waterloo, and was no longer capable of Napoleonic feats, the attack was generally a bayonet attack pure and simple. Waterloo and the Alma were credited, not to fire-power, but to English solidity, and as Ardant du Picq observes, "All the peoples of Europe say 'no one can resist our bayonet attack if it is made resolutely'—and *all are right*. . . . Bayonet fixed or in the scabbard, it is all the same." Since the disappearance of the "dark impenetrable wood" of spears, the question has always turned on the word "resolute." If the defence cannot by any means succeed in mastering the resolution of the assailant, it is doomed. But the means (moral and material) at the disposal of the defence for the purpose of mastering this resolution were, within a few years of the Crimean War, revolutionized by the general adoption of the rifle, the introduction of the breech-loader and the revival of the "nation in arms."

Infantry methods, 1815-1870.

Thirty years before the Crimea the flint-lock had given way to the percussion lock (see GUN), which was more certain in its action and could be used in all weathers. But fitting a copper cap on the nipple was not so simple a matter for nervous fingers as priming with a pinch of powder, and the usual rate of fire had fallen from the five rounds a minute of Frederick's day to two or three at the most. "Fire-power" therefore was at a low level until the general introduction[2] of the rifled barrel, which while further diminishing the rate of fire, at any rate greatly increased the range at which volleys were thoroughly effective. Artillery (see ARTILLERY, § 13), the fire-weapon of the

[1] Even when the hostile artillery was still capable of fire these masses were used, for in no other formation could the heterogeneous and ill-trained infantry of Napoleon's vassal states (which constituted half of his army) be brought up at all.

[2] Rifles had, of course, been used by corps of light troops (both infantry and mounted) for many years. The British Rifle Brigade was formed in 1800, but even in the Seven Years' War there were rifle-corps or companies in the armies of Prussia and Austria. These older rifles could not compare in rapidity or volume of fire with the ordinary firelock.

attack, made no corresponding progress, and even as early as the Alma and Inkerman (where the British troops used the Minie rifle) the dense columns had suffered heavily without being able to retaliate by " crossing bayonets." Fire power, therefore, though still the special prerogative of the defence, began to reassert its influence, and for a brief period the defensive was regarded as the best form of tactics. But the low rate of fire was still a serious objection. Many incidents in the American Civil War showed this, notably Fredericksburg, where the key of the Confederate position was held—against a simple frontal attack unsupported by effective artillery fire—by three brigades in line one behind the other, *i.e.* by a *six-deep* firing line. No less force could guarantee the " inviolability of the front," and even when, in this unnatural and uneconomical fashion, the rate of fire was augmented as well as the effective range, a properly massed and well-led attack in column (or in a rapid succession of deployed lines) generally reached the defender's position, though often in such disorder that a resolute counterstroke drove it back again. The American fought over more difficult country and with less previous drill-training than the armies of the Old World. The fire-power of the defence, therefore, that even in America did not always prevail over the resolution of the attack, entirely failed in the Italian war of 1859 to stop the swiftly moving, well-drilled columns of the French professional army, in which the national *élan* had not as yet been suppressed, as it was a few years later, by the doctrine that " the new arms found their greatest scope in the defence." The Austrians, who had pinned their faith to this doctrine, deserted their false gods, forbade any mention of the defensive in their drill-books, and brought back into honour the bayonet tactics of the old wars.

The need of artillery support for the attack was indeed felt (though the gunners had not as yet evolved any substitute for the case-shot preparation of Napoleon's time), but men remembered that artillery was used by the great captain, not so much to enable good troops to close with the enemy, as to win battles with masses of troops of an inferior stamp, and contemporary experience seemed to show that (if losses were accepted as inevitable) good and resolute troops could overpower the defence, even in face of the rifle and without the aid of case shot. But a revolution was at hand.

The breech-loading rifle.

In 1861 Moltke, discussing the war in Italy, wrote, " General Niel attributes his victory (at Solferino) to the bayonet. But that does not imply that the attack was often followed by a hand-to-hand fight. In principle, when one makes a bayonet charge, it is because one supposes that the enemy will not await it. . . . *To approach the enemy closely, pouring an efficacious fire into him*—as Frederick the Great's infantry did—*is also a method of the offensive.*" This method was applicable at that time for the Prussians alone, for they alone possessed a breech-loading firearm. The needle-gun was a rudimentary weapon in many respects, but it allowed of maintaining more than twice the rate of fire that the muzzle-loader could give, and, moreover, it permitted the full use of cover, because the firer could lie down to fire without having to rise between every round to load. Further, he could load while actually running forward, whereas with the old arms loading not only required complete exposure but also checked movement. The advantages of the Prussian weapon were further enhanced, in the war against Austria, by the revulsion of feeling in the Imperial army in favour of the pure bayonet charge in masses that had followed upon Magenta and Solferino.

With the stiffly drilled professional soldier of England, Austria and Russia the handiness of the new weapon could hardly have been exploited, for (in Russia at any rate) even skirmishers had to march in step. The Prussians were drilled nominally in accordance with regulations dating from 1812, and therefore suitable, if not to the new weapon, at least to the " swarm " fighting of an enthusiastic national army, but upon these regulations a mass of peace-time amendments had been superposed, and in theory their drill was as stiff as that of the Russians. But, as in France in 1793–1796, the composition of their army—a true " nation in arms "—and the character of the officers evolved by the universal service system saved them from their regulations. The offensive spirit was inculcated as thoroughly as elsewhere, and in a much more practical form. Dietrich von Bülow's predictions of the future battle of " skirmishers " (meaning thereby a dense but irregular firing line) had captivated the younger school of officers, while King William and the veterans of Napoleon's wars were careful to maintain small columns (sometimes company [1] columns of 240 rifles, but quite as often half-battalion and battalion columns) as a solid background to the firing line. Thus in 1866 (see SEVEN WEEKS' WAR), as Moltke had foreseen, the attacking infantry fought its way to close quarters by means of its own fire, and the bayonet charge again became, in his own words, " not the first, but the last, phase of the combat," immediately succeeding a last burst of rapid fire at short range and carried out by the company and battalion reserves in close order. Against the Austrians, whose tactics alternated between unprepared bayonet rushes by whole brigades and a passive slow-firing defensive, victory was easily achieved.

Infantry in the war of 1870.

But immediately after Königgrätz the French army was served out with a breech-loading rifle greatly superior in every respect to the needle-gun, and after four years' tension France pitted breech-loader against breech-loader. In the first battles (see WÖRTH, and METZ: *Battles*) the decision-seeking spirit of the " armed nation," the inferior range of the needle-gun as compared with that of the chassepot, and the recollections of easy triumphs in 1864 and 1866, all combined to drive the German infantry forward to within easy range before they began to make use of their weapons. Their powerful artillery would have sufficed of itself to enable them to do this (see SEDAN), had they but waited for its fire to take effect. But they did not, and they suffered accordingly, for, owing to the ineffectiveness of their rifle between 1000 and 400 yds. range, they had to advance, as the Austrians and Russians had done in previous wars, without firing a shot. In these circumstances their formations, whether line or column, broke up, and the whole attacking force dissolved into long irregular swarms. These swarms were practically composed only of the brave men, while the rest huddled together in woods and valleys. When, therefore, at last the firing line came within 400 or 500 yds. of the French, it was both severely tried and numerically weak, but the fact that it was composed of the best men only enabled it to open and to maintain an effective fire. Even then the French, highly disciplined professional soldiers that they were, repeatedly swept them back by counter-strokes, but these counterstrokes were subjected to the fire of the German guns and were never more than locally and momentarily effective. More and more German infantry was pushed forward to support the firing line, and, like its predecessors, each reinforcement, losing most of its unwilling men as it advanced over the shot-swept ground, consisted on arrival of really determined men, and closing on the firing line pushed it forward, sometimes 20 yds., sometimes 100, until at last rapid fire at the closest ranges dislodged the stubborn defenders. Bayonets (as usual) were never actually used, save in sudden encounters in woods and villages. The decisive factors were, first the superiority of the Prussian guns, secondly, heavy and effective fire delivered at short range, and above all the high *moral* of a proportion of resolute soldiers who, after being subjected for hours to the most demoralizing influences, had still courage left for the final dash. These three factors, in spite of changes in armament, rule the infantry attack of to-day.

INFANTRY TACTICS SINCE 1870

The net result of the Franco-German War on infantry tactics, as far as it can be summed up in a single phrase, was to transfer the fire-fight to the line of skirmishers. Henceforward the old and correct sense of the word " skirmishers " is lost. They have

[1] The Prussian company was about 250 strong (see below under " Organization "). This strength was adopted after 1870 by practically all nations which adopted universal service. The battalion had 4 companies.

nothing to do with a "skirmish," but are the actual organ of battle, and their old duties of feeling the way for the battle-formations have been taken over by "scouts." The last-named were not, however, fully recognized in Great Britain[1] till long after the war—not in fact until the war in South Africa had shown that the "skirmisher" or firing line was too powerful an engine to be employed in mere "feeling." In most European armies "combat patrols," which work more freely, are preferred to scouts, but the idea is the same.

Lessons of 1870.

The fire-fight on the line of skirmishers, now styled the *firing line*, is the centre of gravity of the modern battle. In 1870, owing to the peculiar circumstances of unequal armament, the "fire-fight" was insufficiently developed and uneconomically used, and after the war tacticians turned their attention to the evolution of better methods than those of Wörth and Gravelotte, Europe in general following the lead of Prussia. Controversy, in the early stages, took the form of a contest between "drill" and "individualism," irrespective of formations and technical details, for until about 1890 the material efficiency of the gun and the rifle remained very much what it had been in 1870, and the only new factor bearing on infantry tactics was the general adoption of a "national army" system similar to Prussia's and of rifles equal, and in some ways superior, to the chassepot. All European armies, therefore, had to consider equality in artillery power, equality in the ballistics of rifles, and equal intensity of fighting spirit as the normal conditions of the next battle of nations. Here, in fact, was an equilibrium, and in such conditions how was the attacking infantry to force its way forward, whether by fire or movement or by both? France sought the answer in the domain of artillery. Under the guidance of General Langlois, she re-created the Napoleonic hurricane of case-shot (represented in modern conditions by time shrapnel), while from the doctrine formed by Generals Maillard and Bonnal there came a system of infantry tactics derived fundamentally from the tactics of the Napoleonic era. This, however, came later; for the moment (viz. from 1871 to about 1890) the lead in infantry training was admittedly in the hands of the Prussians.

German officers who had fought through the war had seen the operations, generally speaking, either from the staff officer's or from the regimental officer's point of view. To the former and to many of the latter the most indelible impression of the battlefield was what they called *Massen-Drückebergertum* or "wholesale skulking." The rest, who had perhaps in most cases led the brave remnant of their companies in the final assaults, believed that battles were won by the individual soldier and his rifle. The difference between the two may be said to lie in this, that the first sought a remedy, the second a method. The remedy was *drill*, the method *extended order*.

The extreme statement of the case in favour of drill pure and simple is to be found in the famous anonymous pamphlet *A Summer Night's Dream*, in which a return to the "old Prussian fire-discipline" of Frederick's day was offered as the solution of the problem, how to give "fire" its maximum efficacity. Volleys and absolutely mechanical obedience to word of command represent, of course, the most complete application of fire-power that can be conceived. But the proposals of the extreme close-order school were nevertheless merely pious aspirations, not so much because of the introduction of the breechloader as because the short-service "national" army can never be "drilled" in the Frederician sense. The proposals of the other school were, however, even more impracticable, in that they rested on the hypothesis that all men were brave, and that, consequently, all that was necessary was to teach the recruit how to shoot and to work with other individuals in the squad or company. Disorder of the firing line was accepted, not as an unavoidable evil, but as a condition in which individuality had full play, and as dense swarm formations were quite as vulnerable as an ordinary line, it was an easy step from a thick line of "individuals" to a thin one. The step was, in fact, made in the middle of the war of 1870, though it was hardly noticed that extension only became practicable in proportion as the quality of the enemy decreased and the Germans became acclimatized to fire.

Between these extremes, a moderate school, with the emperor William (who had more experience of the human being in battle than any of his officers) at its head, spent a few years in groping for close-order formations which admitted of control without vulnerability, then laid down the principle and studied the method of developing the greatest fire-power of which short-service infantry was supposed capable, ultimately combined the "drill" and teaching ideas in the German infantry regulations of 1888, which at last abolished those of 1812 with their multitudinous amendments.

Conditions of the modern battle.

The necessity for "teaching" arose partly out of the new conditions of service and the relative rarity of wars. The soldier could no longer learn the ordinary rules of safety in action and comfort in bivouac by experience, and had to be taught. But it was still more the new conditions of fighting that demanded careful individual training. Of old, the professional soldier (other than the man belonging to light troops or the ground scout) was, roughly speaking, either so far out of immediate danger as to preserve his reasoning faculties, or so deep in battle that he became the unconscious agent of his inborn or acquired instincts. But the increased range of modern arms prolonged the time of danger, and although (judged by casualty returns) the losses to-day are far less than those which any regiment of Frederick's day was expected to face without flinching, and actual fighting is apparently spasmodic, the period in which the individual soldier is subjected to the fear of bullets is greatly increased. Zorndorf, the most severe of Frederick's battles, lasted seven hours, Vionville twelve and Wörth eleven. The battle of the future in Europe, without being as prolonged as Liao-Yang, Shaho and Mukden, will still be undecided twenty-four hours after the advanced guards have taken contact. Now, for a great part of this time, the "old Prussian fire-discipline," which above all aims at a rapid decision, will be not only unnecessary, but actually hurtful to the progress of the battle as a whole. As in Napoleon's day (for reasons presently to be mentioned) the battle must resolve itself into a preparative and a decisive phase.[2] In the last no commander could desire a better instrument (if such were attainable with the armies of to-day) than Frederick's forged steel machine, in which every company was a human mitrailleuse. But the preparatory combat not only will be long, but also must be graduated in intensity at different times and places in accordance with the commander's will, and the Frederician battalion only attained its mechanical perfection by the absolute and permanent submergence of the individual qualities of each soldier, with the result that, although it furnished the maximum effort in the minimum time, it was useless once it fell apart into ragged groups. The individual spirit of earnestness and intelligence in the use of ground by small fractions, which in Napoleon's day made the *combat d'usure* possible, was necessarily unknown in Frederick's. On the other hand, graduation implies control on the part of the leaders, and this the method of irregular swarms of individual fighters imagined by the German progressives merely abdicates. At most such swarms—however close or extended—can only be tolerated as an evil that no human power can avert when the battle has reached a certain stage of intensity. Even the latest German *Infantry Training* (1906) is explicit on this point. "It must never be forgotten that the obligation of abandoning close order is an evil which can often be avoided when" &c. &c. (par. 342). The consequences of this evil, further, are actually less serious in proportion as the troops are well drilled—not to

[1] The 1902 edition of *Infantry Training* indeed treated the new scouts as a thin advanced firing line, but in 1907, at which date important modifications began to be made in the "doctrine" of the British Army, the scouts were expressly restricted to the old-fashioned "skirmishing" duties.

[2] This is no new thing, but belongs, irrespective of armament, to the "War of masses." The king of Prussia's fighting instructions of the 10th of August 1813 lay down the principle as clearly as any modern work.

an unnecessary and unattainable ideal of mechanical perfection, but to a state of instinctive self-control in danger. Drill, therefore, carried to such a point that it has eliminated the bad habits of the recruit without detriment to his good habits, is still the true basis of all military training, whether training be required for the swift controlled movements of bodies of infantry in close order, for the cool and steady fire of scattered groups of skirmishers, or for the final act of the resolute will embodied in the "decisive attack." Unfortunately for the solution of infantry problems "drill" and "close order" are often confused, owing chiefly to the fact that in the 1870 battles the dissolution of close order formations practically meant the end of control as control was then understood. Both the material and objective, and the inward and spiritual significances of "drill" are, however, independent of "close order." In fact, in modern history, when a resolute general has made a true decisive attack with half-drilled troops, he has generally arrayed them in the closest possible formations.

Drill. Drill is the military form of education by repetition and association (see G. le Bon, *Psychologie de l'éducation*). Materially it consists in exercises frequently repeated by bodies of soldiers with a view to ensuring the harmonious action of each individual in the work to be performed by the mass—in a word, rehearsals. Physical "drill" is based on physiology and gymnastics, and aims at the development of the physique and the individual will power.[1] But the psychological or moral is incomparably the most important side of drill. It is the method or art of discipline. Neither self-control nor devotion in the face of imminent danger can as a rule come from individual reasoning. A commander-in-chief keeps himself free from the contact with the turmoil of battle so long as he has to calculate, to study reports or to manœuvre, and commanders of lower grades, in proportion as their duty brings them into the midst of danger, are subjected to greater or less disturbing influences. The man in the fighting line where the danger is greatest is altogether the slave of the unconscious. Overtaxed infantry, whether defeated or successful, have been observed to present an appearance of absolute insanity. It is true that in the special case of great war experience reason resumes part of its dominion in proportion as the fight becomes the soldier's habitual *milieu*. Thus towards the end of a long war men become skilful and cunning individual fighters; sometimes, too, feelings of respect for the enemy arise and lead to interchange of courtesies at the outposts, and it has also been noticed that in the last stage of a long war men are less inclined to sacrifice themselves. All this is "reason" as against inborn or inbred "instinct." But in the modern world, which is normally at peace, some method must be found of ensuring that the peace-trained soldier will carry out his duties when his reason is submerged. Now we know that the constant repetition of a certain act, whether on a given impulse or of the individual's own volition, will eventually make the performance of that act a reflex action. For this reason peace-drilled troops have often defeated a war-trained enemy, even when the motives for fighting were equally powerful on each side. The mechanical performance of movements, and loading and firing at the enemy, under the most disturbing conditions can be ensured by bringing the required self-control from the domain of reason into that of instinct. "*L'éducation*," says le Bon, "*est l'art de faire passer le conscient dans l'inconscient.*" Lastly, the instincts of the recruit being those special to his race or nation, which are the more powerful because they are operative through many generations, it is the drill sergeant's business to bring about, by disuse, atrophy of the instincts which militate against soldierly efficiency, and to develop, by constant repetition and special preparation, other useful instincts which the Englishman or Frenchman or German does not as such possess. In short, as regards infantry training, there is no real distinction between drill and education, save in so far as the latter term covers instruction in small details of field service which demand alertness, shrewdness and technical knowledge (as distinct from technical training). As understood by the controversialists of the last generation, drill was the antithesis of education. To-day, however, the principle of education having prevailed against the old-fashioned notion of drill, it has been discovered that after all drill is merely an intensive form of education. This discovery (or rather definition and justification of an existing empirical rule) is attributable chiefly to a certain school of French officers, who seized more rapidly than civilians the significance of modern psycho-physiology. In their eyes, a military body possesses in a more marked degree than another, the primary requisite of the "psychological crowd," studied by Gustave le Bon, viz. the orientation of the wills of each and all members of the crowd in a determined direction. Such a crowd generates a collective will that dominates the wills of the individuals composing it. It coheres and acts on the common property of all the instincts and habits in which each shares. Further it tends to extremes of baseness and heroism—this being particularly marked in the military crowd—and lastly it reacts to a stimulus. The last is the keynote of the whole subject of infantry training as also, to a lesser degree, of that of the other arms. The officer can be regarded practically as a hypnotist playing upon the unconscious activities of his subject. In the lower grades, it is immaterial whether reason, caprice or a fresh set of instincts stimulated by an outside authority, set in motion the "suggestion." The true leader, whatever the provenance of his "suggestion," makes it effective by dominating the "psychological crowd" that he leads. On the other hand, if he fails to do so, he is himself dominated by the uncontrolled will of the crowd, and although leaderless mobs have at times shown extreme heroism, it is far more usual to find them reverting to the primitive instinct of brutality or panic fear. A mob, therefore, or a raw regiment, requires greater powers of suggestion in its leader, whereas a thorough course of drill tunes the "crowd" to respond to the stimulus that average officers can apply.

So far from diminishing, drill has increased in importance under modern conditions of recruiting. It has merely changed in form, and instead of being repressive it has become educative. The force of modern short-service troops, *as troops*, is far sooner spent than that of the old-fashioned automatic regiments, while the reserve force of its component parts, remaining after the dissolution, is far higher than of old. But this uncontrolled force is liable to panic as well as amenable to an impulse of self-sacrifice. In so far, then, it is necessary to adopt the catchword of the Bülow school and to "organize disorder," and the only known method of doing so is drill. "Individualism" pure and simple had certainly a brief reign during and after the South African War, especially in Great Britain, and both France and Germany coquetted with "Boer tactics," until the Russo-Japanese war brought military Europe back to the old principles.

The South African War. But the South African War came precisely at the point of time when the controversies of 1870 had crystallized into a form of tactics that was not suitable to the conditions of that war, while about the same time the relations of infantry and artillery underwent a profound change. As regards the South African War, the clear atmosphere, the trained sight of the Boers, and the alternation of level plain and high concave kopjes which constituted the usual battlefield, made the front to front infantry attacks not merely difficult but almost impossible. For years, indeed ever since the Peninsular War, the tendency of the British army to deploy early had afforded a handle to European critics of its tactical methods. It was a tendency that survived with the rest of the "linear" tradition. But in South Africa, owing to the special advantages of the defenders, which denied to the assailant all reliable indications of the enemy's strength and positions, this early deployment had to take a non-committal form—viz. many successive lines of skirmishers. The application of this form was, indeed, made easy by the openness of the ground, but like all "schematic" formations, open or close, it could not be maintained under fire, with the special disadvantage that the extensions were so wide as to make any manœuvring after the fight had cleared up a situation a practical impossibility. Hence some *preconceived idea* of an objective was an essential preliminary, and as the Boer mounted infantry hardly ever stood to defend any particular position to the last (as they could always renew the fight at some other point in their vast territory), the preconceived idea was always, after the early battles, an envelopment in which the troops told off to the frontal holding attack were required, not to force their advance to its logical conclusion, but to keep the fight alive until the flank attack made itself felt. The principal tendency of British infantry tactics after the Boer War was therefore quite naturally, under European as well as colonial conditions, to deploy at the outset in great depth, *i.e.* in many lines of skirmishers, each line, when within about 1400 yds. of the enemy's position, extending to intervals of 10 to 20 paces between individuals. The reserves were strong and their importance was well marked in the 1902 training manual, but their functions were rather to extend or feed the firing line, to serve as a rallying point in case of defeat and to take up the pursuit (par. 220, *Infantry Training*, 1902), than to form the engine of

[1] In the British Service, men whose nerves betray them on the shooting range are ordered more gymnastics (*Musketry Regulations*, 1910).

a decisive attack framed by the commander-in-chief after "engaging everywhere and then seeing" as Napoleon did. The 1905 regulations adhered to this theory of the attack in the main, only modifying a number of tactical prescriptions which had not proved satisfactory after their transplantation from South Africa to Europe, but after the Russo-Japanese War a series of important amendments was issued which gave greater force and still greater elasticity to the attack procedure, and in 1909 the tactical "doctrine" of the British army was definitively formulated in *Field Service Regulations*, paragraph 102, of which after enumerating the advantages and disadvantages of the "preconceived idea" system, laid it down, as the normal procedure of the British Army, that the general should "obtain the decision by *manœuvre on the battlefield* with a large general reserve maintained in his own hand" and "*strike with his reserve at the right place and time.*"

Formulation of the British "Doctrine."

The rehabilitation of the Napoleonic attack idea thus frankly accepted in Great Britain had taken place in France several years before the South African War, and neither this war nor that in Manchuria effectively shook the faith of the French army in the principle, while on the other hand Germany remains faithful to the "preconceived idea," both in strategy and tactics.[1] This essential difference in the two rival "doctrines" is intimately connected with the revival of the Napoleonic artillery attack, in the form of concentrated time shrapnel.

The Napoleonic artillery preparation, it will be remembered, was a fire of overwhelming intensity delivered against the selected point of the enemy's position, at the moment of the massed and decisive assault of the reserves. In Napoleon's time the artillery went in to within 300 or 400 yds. range for this act, *i.e.* in front of the infantry, whereas now the guns fire over the heads of the infantry and concentrate shells instead of guns on the vital point. The principle is, however, the same. A model infantry attack in the Napoleonic manner was that of Okasaki's brigade on the Terayama hill at the battle of Shaho, described by Sir Ian Hamilton in his *Staff Officer's Scrap-Book*. The Japanese, methodical and cautious as they were, only sanctioned a pure open force assault as a last resort. Then the brigadier Okasaki, a peculiarly resolute leader, arrayed his brigade in a "schematic" attack formation of four lines, the first two in single rank, the third in line and the fourth in company columns. Covered by a powerful converging shrapnel fire, the brigade covered the first 900 yds. of open plain without firing a shot. Then, however, it disappeared from sight amongst the houses of a village, and the spectators watched the thousands of flashes fringing the further edge that indicated a fire-fight at decisive range (the Terayama was about 600 yds. beyond the houses). Forty minutes passed, and the army commander Kuroki said, "He cannot go forward. We are in check to-day all along the line." But at that moment Okasaki's men, no longer in a "schematic" formation but in many irregularly disposed groups—some of a dozen men and some of seventy, some widely extended and some practically in close order—rushed forward at full speed over 600 yds. of open ground, and stormed the Terayama with the bayonet.

Such an attack as that at the battle of Shaho is rare, but so it has always been with masterpieces of the art of war. We have only to multiply the front of attack by two and the forces engaged by five—and to find the resolute general to lead them—to obtain the ideal decisive attack of a future European war. Instead of the bare open plain over which the advance to decisive range was made, a European general would in most cases dispose of an area of spinneys, farm-houses and undulating fields. The schematic approach-march would be replaced in France and England by a forward movement of bodies in close order, handy enough to utilize the smallest covered ways. Then the fire of both infantry and artillery would be augmented to its maximum intensity, overpowering that of the defence, and the whole of the troops opposite the point to be stormed would be thrown forward for the bayonet charge. The formation for this scarcely matters. What is important is speed and the will to conquer, and for this purpose small bodies (sections, half-companies or companies), not in the close order of the drill book but grouped closely about the leader who inspires and controls them, are as potent an instrument as a Fredericián line or a Napoleonic column.

The decisive attack.

Controversy, in fact, does not turn altogether on the method of the assault, or even on the method of obtaining the fire-superiority of guns and rifles that justifies it. Although one nation may rely on its guns more than on the rifles, or vice versa, all are agreed that at decisive range the firing line should contain as many men as can use their rifles effectually. Perhaps the most disputed point is the form of the "approach-march," viz. the dispositions and movements of the attacking infantry between about 1400 and about 600 yds. from the position of the enemy.

The condition of the assailant's infantry when it reaches decisive ranges is largely governed by the efforts it has expended and the losses it has suffered in its progress. Sometimes even after a firing line of some strength has been established at decisive range, it may prove too difficult or too costly for the supports (sent up from the rear to replace casualties and to augment fire-power) to make their way to the front. Often, again, it may be within the commander's intentions that his troops at some particular point in the line should not be committed to decisive action before a given time—perhaps not at all. It is obvious then that no "normal" attack procedure which can be laid down in a drill book (though from time to time the attempt has been made, as in the French regulations of 1875) can meet all cases. But here again, though all armies formally and explicitly condemn the normal attack, each has its own well-marked tendencies.

The approach-march.

The German regulations of 1906 define the offensive as "transporting fire towards the enemy, if necessary to his immediate proximity"; the bayonet attack "confirms" the victory. Every attack *begins* with deployment into extended order, and the leading line advances as close to the enemy as possible before opening fire. In ground offering cover, the firing line has practically its maximum density at the outset. In open ground, however, half-sections, groups and individuals, widely spaced out, advance stealthily one after the other till all are *in position*. It is on this position, called the "first fire position" and usually about 1000 yds. from the enemy, that the full force of the attack is deployed, and from this position, as simultaneously as possible, it opens the fight for fire-superiority. Then, each unit covering the advance of its neighbours, the whole line fights its way by open force to within charging distance. If at any point a decision is not desired, it is deliberately made impossible by employing there such small forces as possess no offensive power. Where the attack is intended to be pushed home, the infantry units employed act as far as possible simultaneously, resolutely and in great force (see the German *Infantry Regulations*, 1906, §§ 324 et seq.).

Current views on the infantry attack.

While in Germany movement "transports the fire," in France fire is regarded as the way to make movement possible. It is considered (see Grandmaison, *Dressage de l'infanterie*) that a premature and excessive deployment enervates the attack, that the ground (*i.e.* covered ways of approach for small columns, not for troops showing a fire front) should be used as long as possible to march "en troupe" and that a firing line should only be formed when it is impossible to progress without acting upon the enemy's means of resistance. Thereafter each unit, in such order as its chief can keep, should fight its way forward, and help others to do so—like Okasaki's brigade in the last stage of its attack—utilizing bursts of fire or patches of wood or depressions in the ground, as each is profitable or available to assist the advance. "From the moment when a fighting unit is 'uncoupled,' its action must be ruled by two conditions, and by those only: the one material, an object to be reached; the other moral, the will to reach the object."

[1] In 1870 the "preconceived idea" was practically confined to strategy, and the tactical improvisations of the Germans themselves deranged the execution of the plan quite as often as the act of the enemy. Of late years, therefore, the "preconceived idea" has been imposed on tactics also in that country. Special care and study is given to the once despised "early deployments" in cases where a fight is part of the "idea," and to the difficult problem of breaking off the action, when it takes a form that is incompatible with the development of the main scheme.

The British *Field Service Regulations* of 1909 are in spirit more closely allied to the French than to the German. "The climax of the infantry attack is the assault, which is made possible by superiority of fire" is the principle (emphasized in the book itself by the use of conspicuous type), and a "gradual *building up of the firing line within close range* of the position," coupled with the closest artillery support, and the final blow of the reserves delivered "unexpectedly and in the greatest possible strength" are indicated as the means.[1]

Defence. The *defence*, as it used to be understood, needs no description. To-day in all armies the defence is looked upon not as a means of winning a battle, but as a means of temporizing and avoiding the decision until the commander of the defending party is enabled, by the general military situation or by the course and results of the defensive battle itself, to take the offensive. In the British *Field Service Regulations* it is laid down that when an army acts on the defensive no less than half of it should if possible be earmarked, suitably posted and placed under a single commander, for the purpose of delivering a decisive counter-attack. The object of the purely defensive portion, too, is not merely to hold the enemy's firing line in check, but to drive it back so that the enemy may be forced to use up his local reserve resources to keep the fight alive. A firing line covered and steadied by entrenchments, and restless local reserves ever on the look-out for opportunities of partial counterstrokes, are the instruments of this policy.

Entrenchments. A word must be added on the use of entrenchments by infantry, a subject the technical aspect of which is fully dealt with and illustrated in FORTIFICATION AND SIEGECRAFT: *Field Defences.* Entrenchments of greater or less strength by themselves have always been used by infantry on the defensive, especially in the wars of position of the 17th and 18th centuries. In the Napoleonic and modern "wars of movement," they are regarded, not as a passive defence—they have long ceased to present a physical barrier to assault—but as fire positions so prepared as to be defensible by relatively few men. Their purpose is, by economizing force elsewhere, to give the maximum strength to the troops told off for the counter-offensive. In the later stages of the American Civil War, and also in the Russo-Japanese War of 1904–1905—each in its way an example of a "war of positions"—the assailant has also made use of the methods of fortification to secure every successive step of progress in the attack. The usefulness and limitations of this procedure are defined in generally similar terms in the most recent training manuals of nearly every European army. Section 136, § 7 of the British *Infantry Training* (1905, amended 1907) says: "During the process of establishing a superiority of fire, successive fire positions will be occupied by the firing line. As a rule those affording natural cover will be chosen, but if none exist and the intensity of the hostile fire preclude any immediate further advance, it may be expedient for the firing line to create some. This hastily constructed protection will enable the attack to cope with the defender's fire and thus prepare the way for a farther advance. The construction of cover during an attack, however, will entail delay and a temporary loss of fire effect *and should therefore be resorted to only when absolutely necessary*. . . . As soon as possible the advance should be resumed, &c." The German regulations are as follows (*Infantry Training*, 1906, § 313): "In the offensive the entrenching tool may be used where it is desired, for the moment, to content one's self with maintaining the ground gained. . . . The entrenching tool is only to be used with the greatest circumspection, because of the great difficulty of getting an extended line to go forward under fire when it has expended much effort in digging cover for itself. The construction of trenches must never paralyze the desire for the irresistible advance, *and above all must not kill the spirit of the offensive.*"

ORGANIZATION AND EQUIPMENT

The organization of infantry varies rather more than that of other arms in different countries. Taking the British system first, the battalion (and not as elsewhere the regiment of two, three or more battalions) is the administrative and manœuvre unit. It is about 1000 strong, and is commanded by a lieutenant-colonel, who has a major and an adjutant (captain or lieutenant) to assist him, and an officer of lieutenant's or captain's rank (almost invariably promoted from the ranks), styled the quartermaster, to deal with supplies, clothing, &c. There are eight companies of a nominal strength of about 120 each. These are commanded by captains (or by junior majors), and each captain has or should have two lieutenants or second lieutenants to assist him. Machine guns are in Great Britain distributed to the battalions and not massed in permanent batteries. In addition there are various regimental details, such as orderly-room staff, cooks, cyclists, signallers, band and ambulance men. The company is divided into four sections of thirty men each and commanded by sergeants. A half-company of two sections is under the control of a subaltern officer. A minor subdivision of the section into two "squads" is made unless the numbers are insufficient to warrant it. In administrative duties the captain's principal assistant is the colour-sergeant or pay-sergeant, who is not assigned to a section command. The lieutenant-colonel, the senior major and the adjutant are mounted. The commanding officer is assisted by a battalion staff, at the head of which is the adjutant. The sergeant-major holds a "warrant" from the secretary of state for war, as does the bandmaster. Other members of the battalion staff are non-commissioned officers, appointed by the commanding officer. The most important of these is the quartermaster-sergeant, who is the assistant of the quartermaster. The two colours ("king's" and "regimental") are in Great Britain carried by subalterns and escorted by colour-sergeants (see COLOURS).

The "tactical" unit of infantry is now the *company*, which varies very greatly in strength in the different armies. Elsewhere the company of 250 rifles is almost universal, but in Great Britain the company has about 110 men in the ranks, forming four sections. These sections, each of about 28 rifles, are the normal "fire-units," that is to say, the unit which delivers its fire at the orders of and with the elevation and direction given by its commander. This, it will be observed, gives little actual executive work for the junior officers. But a more serious objection than this (which is modified in practice by arrangement and circumstances) is the fact that a small unit is more affected by detachments than a large one. In the home battalions of the Regular Army such detachments are very large, what with finding drafts for the foreign service battalions and for instructional courses, while in the Territorial Force, where it is so rarely possible to assemble all the men at once, the company as organized is often too small to drill as such. On the other hand, the full war-strength company is an admirable unit for control and manœuvre in the field, owing to its rapidity of movement, handiness in using accidents of ground and cover, and susceptibility to the word of command of one man. But as soon as its strength falls below about 80 the advantages cease to counterbalance the defects. The sections become too small as fire-units to effect really useful results, and the battalion commander has to co-ordinate and to direct 8 comparatively ineffective units instead of 4 powerful ones. The British regular army, therefore, has since the South African War, adopted the *double company* as the unit of training. This gives at all times a substantial unit for fire and manœuvre training, but the disadvantage of having a good many officers only half employed is accentuated. As to the tactical value of the large or double company, opinions differ. Some hold that as the small company is a survival from the days when the battalion was the tactical unit and the company was the unit of volley-fire, it is unsuited to the modern exigencies that have broken up the old rigid line into several independent and co-operating fractions. Others reply that the strong continental company of 250 rifles came into existence in Prussia in the years after Waterloo, not from tactical reasons, but because the state was too poor to maintain a large establishment of officers, and that in 1870, at any rate, there were many instances of its tactical unwieldiness. The point that is common to both organizations is the fact that there is theoretically one subaltern to every 50 or 60 rifles, and this reveals an essential difference between the British and the Continental systems, irrespective of the sizes or groupings of companies. The French or German subaltern effectively commands his 50 men as a unit, whereas the British subaltern supervises two groups of 25 to 30 men under responsible non-commissioned officers. That is to say, a British sergeant may find himself in such a position that he has to be as expert in controlling and obtaining good results from collective fire as a German lieutenant. For reasons mentioned in ARMY, § 40, non-commissioned officers, of the type called by Kipling the "backbone of the army," are almost unobtainable with the universal service system, and the lowest unit that possesses any independence is the lowest unit commanded by an officer. But apart from the rank of the fire-unit commander, it is questionable whether the section, as understood in England, is not too small a fire-unit, for European warfare at any rate. The regulations of the various European armies, framed for these conditions, practically agree that the fire-unit should be commanded by an officer and should be large enough to ensure good results from collective fire. The number of rifles meeting this second condition is 50 to 80 and their organization a "section" (corresponding to the British half-company) under a subaltern officer. The British army has, of course, to be organized and trained for an infinitely wider range of activity, and no one would suggest the abolition of the small section as a fire-unit. But in a great European battle it would be almost certainly better to group the two sections into a real unit for fire effect. (For questions of infantry fire tactics see RIFLE: § *Musketry*.)

On the continent of Europe the "regiment," which is a unit, acting in peace and war as such, consists normally of three battalions, and

[1] In February 1910 a new *Infantry Training* was said to be in preparation. The *I.T.* of 1905 is in some degree incompatible with the later and ruling doctrine of the *F.S. Regulations*, and in the winter of 1909 the Army Council issued a memorandum drawing attention to the different conceptions of the decisive attack as embodied in the latter and as revealed in manœuvre procedure.

each battalion of four companies or 1000 rifles. The company of 250 rifles is commanded by a captain, who is mounted. In France the company has four sections, commanded in war by the three subalterns and the "adjudant" (company sergeant-major); the sections are further grouped in pairs to constitute *pelotons* (platoons) or half-companies under the senior of the two section leaders. In peace there are two subalterns only, and the *peloton* is the normal junior officer's command. The battalion is commanded by a major (*commandant* or strictly *chef de bataillon*), the regiment (three or four battalions) by a colonel with a lieutenant-colonel as second. An organization of 3-battalion regiments and 3-company battalions was proposed in 1910.

In Germany, where what we have called the continental company originated, the regiment is of three battalions under majors, and the battalion of four companies commanded by captains. The company is divided into three *Züge* (sections), each under a subaltern, who has as his second a sergeant-major, a "vice-sergeant-major" or a "sword-knot ensign" (aspirant officer). In war there is one additional officer for company. The *Zug* at war-strength has therefore about 80 rifles in the ranks, as compared with the French "section" of 50, and the British section of 30.

The system prevailing in the United States since the reorganization of 1901 is somewhat remarkable. The regiment, which is a tactical as well as an administrative unit, consists of three battalions. Each battalion has four companies of (at war-strength) 3 officers and 150 rifles each. The regiment in war therefore consists of about 1800 rifles in three small and handy battalions of 600 each. The circumstances in which this army serves, and in particular the maintenance of small frontier posts, have always imposed upon subalterns the responsibilities of small independent commands, and it is fair to assume that the 75 rifles at a subaltern's disposal are regarded as a tactical unit.

In sum, then, the infantry battalion is in almost every country about 1000 rifles strong in four companies. In the United States it is 600 strong in four companies, and in Great Britain it is 1000 strong in eight. The captain's command is usually 200 to 250 men, in the United States 150, and in Great Britain 120. The lieutenant or second lieutenant commands in Germany 80 rifles, in France 50, in the United States 75, as a unit of fire and manœuvre. In Great Britain he commands, with relatively restricted powers, 60.

A short account of the infantry equipments—knapsack or valise, belt, haversack, &c.—in use in various countries will be found in UNIFORMS, NAVAL AND MILITARY. The armament of infantry is, in all countries, the magazine rifle (see RIFLE) and bayonet (*q.v.*), for officers and for certain under-officers sword (*q.v.*) and pistol (*q.v.*). Ammunition (*q.v.*) in the British service is carried (*a*) by the individual soldier, (*b*) by the reserves (mules and carts) in regimental charge, some of which in action are assembled from the battalions of a brigade to form a brigade reserve, and (*c*) by the ammunition columns.

BIBLIOGRAPHY.—The following works are selected to show (1) the historical development of the arm, and (2) the different "doctrines" of to-day as to its training and functions:—Ardant du Picq, *Études sur le combat*; C. W. C. Oman, *The Art of War: Middle Ages*; Biottot, *Les Grands Inspirés—Jeanne d'Arc*; Hardy de Périni, *Batailles françaises*; C. H. Firth, *Cromwell's Army*; German official history of Frederick the Great's wars, especially *Erster Schlesische Krieg*, vol. i.; Susane, *Histoire de l'infanterie française*; French General Staff, *La Tactique au XVIII^{me} siècle—l'infanterie* and *La Tactique et la discipline dans les armées de la Révolution—Général Schauenbourg*; J. W. Fortescue, *History of the British Army*; Moorsom, *History of the 52nd Regiment*; de Grandmaison, *Dressage de l'infanterie* (Paris, 1908); works of W. v. Scherff; F. N. Maude, *Evolution of Infantry Tactics and Attack and Defence*; [Meckel] *Ein Sommernachtstraum* (Eng. trans. in *United Service Magazine*, 1890); J. Meckel. *Taktik*; Malachowski, *Scharfe- und Revuetaktik*; H. Langlois, *Enseignements de deux guerres*; F. Hoenig, *Tactics of the Future* and *Twenty-four Hours of Moltke's Strategy* (Eng. trans.); works of A. von Boguslowski; *British Officers' Reports on the Russo-Japanese War*; H. W. L. Hime, *Stray Military Papers*; Grange, "Les Réalités du champ de bataille—Woerth" (*Rev. d'infanterie*, 1908-1909); V. Lindenau, "The Boer War and Infantry Attack" (*Journal R. United Service Institution*, 1902-1903); Janin, "Aperçus sur la tactique—Mandchourie" (*Rev. d'infanterie*, 1909); Soloviev, "Infantry Combat in the Russo-Jap. War" (Eng. trans. *Journal R.U.S.I.*, 1908); British Official *Field Service Regulations*, part i. (1909), and *Infantry Training* (1905); German drill regulations of 1906 (Fr. trans.); French drill regulations of 1904; Japanese regulations 1907 (Eng. trans.). The most important journals devoted to the infantry arm are the French official *Revue d'infanterie* (Paris and Limoges), and the *Journal of the United States Infantry Association* (Washington, D. C.). (C. F. A.)

INFANT SCHOOLS. The provision in modern times of systematized training for children below the age when elementary education normally begins may be dated from the village school at Waldbach founded by Jean Frédéric Oberlin in 1774. Robert Owen started an infant school at New Lanark in 1800, and great interest in the question was taken in Great Britain during the early years of the 19th century, leading to the foundation in 1836 of the Home and Colonial School Society for the training of teachers in infant schools; this in turn reacted upon other countries, especially Germany. Further impetus and a new direction were given to the movement by Friedrich W. A. Froebel, and the methods of training adopted for children between the ages of three and six have in most countries been influenced by, if not based on, that system of directed activities which was the foundation of the type of "play-school" called by him the *Kinder Garten*, or "children's garden." The growing tendency in England to lay stress on the mental training of very young children, and to use the "infant school" as preparatory to the elementary school, has led to a considerable reaction; medical officers of health have pointed out the dangers of infection to which children up to the age of five are specially liable when congregated together—also the physical effects of badly ventilated class-rooms, and there is a consensus of opinion that formal mental teaching is directly injurious before the age of six or even seven years. At the same time the increase in the industrial employment of married women, with the consequent difficulty of proper care of young children by the mother in the home, has somewhat shifted the ground from a purely educational to a social and physical aspect. While it is agreed that the ideal place for a young child is the home under the supervision of its mother, the present industrial conditions often compel a mother to go out to work, and leave her children either shut up alone, or free to play about the streets, or in the care of a neighbour or professional "minder." In each case the children must suffer. The provision by a public authority of opportunities for suitable training for such children seems therefore a necessity. The moral advantages gained by freeing the child from the streets, by the superintendence of a trained teacher over the games, by the early inculcation of habits of discipline and obedience; the physical advantages of cleanliness and tidiness, and the opportunity of disclosing incipient diseases and weaknesses, outweigh the disadvantages which the opponents of infant training adduce. It remains to give a brief account of what is done in Great Britain, the United States of America, and certain other countries. A valuable report was issued for the English Board of Education by a Consultative Committee upon the school attendance of children below the age of five (vol. 22 of the *Special Reports*, 1909), which also gives some account of the provision of day nurseries or *crèches* for babies.

United Kingdom.—Up to 1905 it was the general English practice since the Education Act of 1870 for educational authorities to provide facilities for the teaching of children between three and five years old whose parents desired it. In 1905, of an estimated 1,467,709 children between those ages, 583,268 were thus provided for in England and Wales. In 1905 the objections, medical and educational, already stated, coupled with the increasing financial strain on the local educational authorities, led to the insertion in the code of that year of Article 53, as follows: "Where the local education authority have so determined in the case of any school maintained by them, children who are under five years may be refused admission to that school." In consequence in 1907 the numbers were found to have fallen to 459,034 out of an estimated 1,480,550 children, from 39·74% in 1905 to 31%. In the older type of infant school stress was laid on the mental preparation of children for the elementary teaching which was to come later. This forcing on of young children was encouraged by the system under which the government grant was allotted; children in the infant division earned an annual grant of 17s. per head, on promotion to the upper school this would be increased to 22s. In 1909 the system was altered; a rate of 21s. 4d. was fixed as the grant for all children above five, and the grant for those below the age was reduced to 13s. 4d. Different methods of training the teachers in these schools as well as the children themselves have been now generally adopted. These methods are largely based on the Froebelian plan, and greater attention is being paid to physical development. In one respect England is perhaps behind the more progressive of other European countries, viz. in providing facilities for washing and attending to the personal needs of the younger children. There is no *femme de service* as in Belgium on the staff of English schools. While in Ireland the children below the age of five attend the elementary schools in much the same proportion as in England and Wales, in Scotland it has never been the general custom for such children to attend school.

United States of America.—In no country has the kindergarten system taken such firm root, and the provision made for children below the compulsory age is based upon it. In 1873 there were 42 kindergartens with 1252 pupils; in 1898 the numbers had risen to 2884 with 143,720 pupils; more than half these were private schools, managed by charitable institutions or by individuals for profit. In 1904–1905 there were 3176 public kindergartens with 205,118 pupils.

Austria Hungary.—Provision in Austria is made for children under six by two types of institution, the Day Nursery (*Kinderbewahranstalten*) and the Kindergarten. In 1872 as the result of a State Commission the Kindergarten was established in the state system of education. Its aim is to "confirm and complete the home education of children under school age, so that through regulated exercise of body and mind they may be prepared for institution in the primary school." No regular teaching in ordinary school subjects is allowed; games, singing and handwork, and training of speech and observation by objects, tales and gardening are the means adopted. The training for teachers in these schools is regulated by law. No children are to be received in a kindergarten till the beginning of the fourth and must leave at the end of the sixth year. In 1902–1903 there were 77,002 children in kindergartens and 74,110 in the day nurseries. In Hungary a law was passed in 1891 providing for the education and care of children between three and six, either by *asyle* or nurseries open all the year round in communes which contribute from £830 to £1250 in state taxation, or during the summer in those whose contribution is less. Communes above the higher sum must provide kindergartens. In 1904 there were over 233,000 children in such institutions.

Belgium.—For children between three and six education and training are provided by *Écoles gardiennes* or *Jardins d'enfants.* They are free but not compulsory, are provided and managed by the communes, receive a state grant, and are under government inspection. Schools provided by private individuals or institutions must conform to the conditions of the communal schools. There is a large amount of voluntary assistance especially in the provision of clothes and food for the poorer children. The state first recognized these schools in 1833. In 1881 there were 708 schools with accommodation for over 56,000 children; in 1907 there were 2837 and 264,845 children, approximately one-half of the total number of children in the country between the ages of three and six. In 1890 the minister of Public Instruction issued a code of rules on which is based the organization of the *Écoles gardiennes* throughout Belgium, but some of the communes have regulations of their own. A special examination for teachers in the *Écoles gardiennes* was started in 1898. All candidates must pass this examination before a *certificat de capacité* is granted. The training includes a course in Froebelian methods. While Froebel's system underlies the training in these schools, the teaching is directed very much towards the practical education of the child, special stress being laid on manual dexterity. Reading, writing and arithmetic are also allowed in the classes for the older children. A marked feature of the Belgian schools is the close attention paid to health and personal cleanliness. In all schools there is a *femme de service*, not a teacher, but an attendant, whose duty it is to see to the tidiness and cleanliness of the children, and to their physical requirements.

France.—The first regular infant school was established in Paris at the beginning of the 19th century and styled a *Salle d'essai.* In 1828 a model school, called a *Salle d'asile*, was started, followed shortly by similar institutions all over France. State recognition and inspection were granted, and by 1836 there were over 800 in Paris and the provinces. In 1848 they became establishments of public instruction, and the name *École maternelle* which they have since borne was given them. Every commune with 2000 inhabitants must have one of these schools or a *Classe enfantine.* Admission is free, but not compulsory, for children between two and six. Food and clothes are provided in exceptional cases. Formal mental instruction is still given to a large extent, and the older children are taught reading, writing and arithmetic. Though the staffs of the school include *femmes de service*, not so much attention is paid to cleanliness as in Belgium, nor is so much stress laid on hygiene. In 1906–1907 there were 4111 public and private *Écoles maternelles* in France, with over 650,000 pupils. The closing of the clerical schools has led to some diminution in the numbers.

Germany.—There are two classes of institution in Germany for children between the ages of 2½ or 3 and 6. These are the *Kleinkinderbewahranstalten* and *Kindergarten.* The first are primarily social in purpose, and afford a place for the children of mothers who have to leave their homes for work. These institutions, principally conducted by religious or charitable societies, remain open all day and meals are provided. Many of them have a kindergarten attached, and others provide some training on Froebelian principles. The kindergartens proper are also principally in private hands, though most municipalities grant financial assistance. They are conducted on advanced Froebelian methods, and formal teaching in reading, writing and arithmetic is excluded. In Cologne, Düsseldorf, Frankfort and Munich there are municipal schools. The state gives no recognition to these institutions and they form no part of the public system of education.

Switzerland.—In the German speaking cantons the smaller towns and villages provide for the younger children by *Bewahranstalten*, generally under private management with public financial help. The larger towns provide kindergartens where the training is free but not compulsory for children from four to six. These are generally conducted on Froebel's system and there is no formal instruction. In the French speaking cantons the *Écoles enfantines* are recognized as the first stage of elementary education. They are free and not compulsory for children from three to six years of age. (C. We.)

INFINITE (from Lat. *in*, not, *finis*, end or limit; cf. *findere*, to cleave), a term applied in common usage to anything of vast size. Strictly, however, the epithet implies the absence of all limitation. As such it is used specially in (1) theology and metaphysics, (2) mathematics.

1. Tracing the history of the world to the earliest date for which there is any kind of evidence, we are faced with the problem that for everything there is a prior something: the mind is unable to conceive an absolute beginning (" ex nihilo nihil "). Mundane distances become trivial when compared with the distance from the earth of the sun and still more of other heavenly bodies: hence we infer infinite space. Similarly by continual subdivision we reach the idea of the infinitely small. For these inferences there is indeed no actual physical evidence: infinity is a mental concept. As such the term has played an important part in the philosophical and theological speculation. In early Greek philosophy the attempt to arrive at a physical explanation of existence led the Ionian thinkers to postulate various primal elements (*e.g.* water, fire, air) or simply the infinite τὸ ἄπειρον (see Ionian School). Both Plato and Aristotle devoted much thought to the discussion as to which is most truly real, the finite objects of sense, or the universal idea of each thing laid up in the mind of God; what is the nature of that unity which lies behind the multiplicity and difference of perceived objects? The same problem, variously expressed, has engaged the attention of philosophers throughout the ages. In Christian theology God is conceived as infinite in power, knowledge and goodness, uncreated and immortal: in some Oriental systems the end of man is absorption into the infinite, his perfection the breaking down of his human limitations. The metaphysical and theological conception is open to the agnostic objection that the finite mind of man is by hypothesis unable to cognize or apprehend not only an infinite object, but even the very conception of infinity itself; from this standpoint the infinite is regarded as merely a postulate, as it were an unknown quantity (cf. $\sqrt{-1}$ in mathematics). The same difficulty may be expressed in another way if we regard the infinite as unconditioned (cf. Sir William Hamilton's " philosophy of the unconditioned," and Herbert Spencer's doctrine of the infinite " unknowable "); if it is argued that knowledge of a thing arises only from the recognition of its differences from other things (*i.e.* from its limitations), it follows that knowledge of the infinite is impossible, for the infinite is by hypothesis unrelated.

With this conception of *the* infinite as absolutely unconditioned should be compared what may be described roughly as lesser infinities which can be philosophically conceived and mathematically demonstrated. Thus a point, which is by definition infinitely small, is as compared with a line a unit: the line is infinite, made up of an infinite number of points, any pair of which have an infinite number of points between them. The line itself, again, in relation to the plane is a unit, while the plane is infinite, *i.e.* made up of an infinite number of lines; hence the plane is described as doubly infinite in relation to the point, and a solid as trebly infinite. This is Spinoza's theory of the "infinitely infinite," the limiting notion of infinity being of a numerical, quantitative series, each term of which is a qualitative determination itself quantitatively little, *e.g.* a line which is quantitatively unlimited (*i.e.* in length) is qualitatively limited when regarded as an infinitely small unit of a plane. A similar relation exists in thought between the various grades of species and genera; the highest genus is the "infinitely infinite," each subordinated genus being infinite in relation to the particulars which it denotes, and finite when regarded as a unit in a higher genus.

2. In mathematics, the term "infinite" denotes the result of increasing a variable without limit; similarly, the term "infinitesimal," meaning indefinitely small, denotes the result of diminishing the value of a variable without limit, with the reservation that it never becomes actually *zero*. The application of these conceptions distinguishes ancient from modern mathematics. Analytical investigations revealed the existence of series or sequences which had no limit to the number of terms, as for example the fraction $1/(1-x)$ which on division gives the series. $1+x+x^2+\ldots$; the discussion of these so-called infinite sequences is given in the articles SERIES and FUNCTION. The doctrine of geometrical continuity (*q.v.*) and the application of algebra to geometry, developed in the 16th and 17th centuries mainly by Kepler and Descartes, led to the discovery of many properties which gave to the notion of infinity, as a localized space conception, a predominant importance. A line became continuous, returning into itself by way of infinity; two parallel lines intersect in a point at infinity; all circles pass through two fixed points at infinity (the circular points); two spheres intersect in a fixed circle at infinity; an asymptote became a tangent at infinity; the foci of a conic became the intersections of the tangents from the circular points at infinity; the centre of a conic the pole of the line at infinity, &c. In analytical geometry the line at infinity plays an important part in trilinear co-ordinates. These subjects are treated in GEOMETRY. A notion related to that of infinitesimals is presented in the Greek "method of exhaustion"; the more perfect conception, however, only dates from the 17th century, when it led to the infinitesimal calculus. A curve came to be treated as a sequence of infinitesimal straight lines; a tangent as the extension of an infinitesimal chord; a surface or area as a sequence of infinitesimally narrow strips, and a solid as a collection of infinitesimally small cubes (see INFINITESIMAL CALCULUS).

INFINITESIMAL CALCULUS. 1. The infinitesimal calculus is the body of rules and processes by means of which continuously varying magnitudes are dealt with in mathematical analysis. The name "infinitesimal" has been applied to the calculus because most of the leading results were first obtained by means of arguments about "infinitely small" quantities; the "infinitely small" or "infinitesimal" quantities were vaguely conceived as being neither zero nor finite but in some intermediate, nascent or evanescent, state. There was no necessity for this confused conception, and it came to be understood that it can be dispensed with; but the calculus was not developed by its first founders in accordance with logical principles from precisely defined notions, and it gained adherents rather through the impressiveness and variety of the results that could be obtained by using it than through the cogency of the arguments by which it was established. A similar statement might be made in regard to other theories included in mathematical analysis, such, for instance, as the theory of infinite series. Many, perhaps all, of the mathematical and physical theories which have survived have had a similar history—a history which may be divided roughly into two periods: a period of construction, in which results are obtained from partially formed notions, and a period of criticism, in which the fundamental notions become progressively more and more precise, and are shown to be adequate bases for the constructions previously built upon them. These periods usually overlap. Critics of new theories are never lacking. On the other hand, as E. W. Hobson has well said, "pertinent criticism of fundamentals almost invariably gives rise to new construction." In the history of the infinitesimal calculus the 17th and 18th centuries were mainly a period of construction, the 19th century mainly a period of criticism.

I. *Nature of the Calculus.*

Geometrical representation of Variable Quantities.

2. The guise in which variable quantities presented themselves to the mathematicians of the 17th century was that of the lengths of variable lines. This method of representing variable quantities dates from the 14th century, when it was employed by Nicole Oresme, who studied and afterwards taught at the Collège de Navarre in Paris from 1348 to 1361. He represented one of two variable quantities, *e.g.* the time that has elapsed since some epoch, by a length, called the "longitude," measured along a particular line; and he represented the other of the two quantities, *e.g.* the temperature at the instant, by a length, called the "latitude," measured at right angles to this line. He recognized that the variation of the temperature with the time was represented by the line, straight or curved, which joined the ends of all the lines of "latitude." Oresme's longitude and latitude were what we should now call the abscissa and ordinate. The same method was used later by many writers, among whom Johannes Kepler and Galileo Galilei may be mentioned. In Galileo's investigation of the motion of falling bodies (1638) the abscissa OA represents the time during which a body has been falling, and the ordinate AB represents the velocity acquired during that time (see fig. 1). The velocity being proportional to the time, the "curve" obtained is a straight line OB, and Galileo showed that the distance through which the body has fallen is represented by the area of the triangle OAB.

FIG. 1.

The problems of Maxima and Minima, Tangents, and Quadratures.

The most prominent problems in regard to a curve were the problem of finding the points at which the ordinate is a maximum or a minimum, the problem of drawing a tangent to the curve at an assigned point, and the problem of determining the area of the curve. The relation of the problem of maxima and minima to the problem of tangents was understood in the sense that maxima or minima arise when a certain equation has equal roots, and, when this is the case, the curves by which the problem is to be solved touch each other. The reduction of problems of maxima and minima to problems of contact was known to Pappus. The problem of finding the area of a curve was usually presented in a particular form in which it is called the "problem of quadratures." It was sought to determine the area contained between the curve, the axis of abscissae and two ordinates, of which one was regarded as fixed and the other as variable. Galileo's investigation may serve as an example. In that example the fixed ordinate vanishes. From this investigation it may be seen that before the invention of the infinitesimal calculus the introduction of a curve into discussions of the course of any phenomenon, and the problem of quadratures for that curve, were not exclusively of geometrical import; the purpose for which the area of a curve was sought was often to find something which is not an area—for instance, a length, or a volume or a centre of gravity.

Greek methods.

3. The Greek geometers made little progress with the problem of tangents, but they devised methods for investigating the problem of quadratures. One of these methods was afterwards called the "method of exhaustions," and the principle on which it is based was laid down in the lemma prefixed to the 12th book of Euclid's *Elements* as follows: "If from the greater of two magnitudes there be taken more than its half, and from the remainder more than its half, and so on, there will at length remain a magnitude less than the smaller of the proposed magnitudes." The method adopted by Archimedes was more general. It may be described as the enclosure of the magnitude to be evaluated between two others which can be brought by a definite process to differ from each other by less than any assigned magnitude. A simple example of its

application is the 6th proposition of Archimedes' treatise *On the Sphere and Cylinder*, in which it is proved that the area contained between a regular polygon inscribed in a circle and a similar polygon circumscribed to the same circle can be made less than any assigned area by increasing the number of sides of the polygon. The methods of Euclid and Archimedes were specimens of rigorous limiting processes (see FUNCTION). The new problems presented by the analytical geometry and natural philosophy of the 17th century led to new limiting processes.

Differentiation.

4. In the *problem of tangents* the new process may be described as follows. Let P, P′ be two points of a curve (see fig. 2). Let x, y be the coordinates of P, and $x+\Delta x$, $y+\Delta y$ those of P′. The symbol Δx means "the difference of two x's" and there is a like meaning for the symbol Δy. The fraction $\Delta y/\Delta x$ is the trigonometrical tangent of the angle which the secant PP′ makes with the axis of x. Now let Δx be continually diminished towards zero, so that P′ continually approaches P. If the curve has a tangent at P the secant P P′ approaches a limiting position (see § 33 below). When this is the case the fraction $\Delta y/\Delta x$ tends to a limit, and this limit is the trigonometrical tangent of the angle which the tangent at P to the curve makes with the axis of x. The limit is denoted by

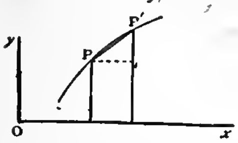

FIG. 2.

$$\frac{dy}{dx}.$$

If the equation of the curve is of the form $y=f(x)$ where f is a functional symbol (see FUNCTION), then

$$\frac{\Delta y}{\Delta x}=\frac{f(x+\Delta x)-f(x)}{\Delta x},$$

and

$$\frac{dy}{dx}=\lim._{\Delta x=0}\frac{f(x+\Delta x)-f(x)}{\Delta x}.$$

The limit expressed by the right-hand member of this defining equation is often written

$$f'(x),$$

and is called the "derived function" of $f(x)$, sometimes the "derivative" or "derivate" of $f(x)$. When the function $f(x)$ is a rational integral function, the division by Δx can be performed, and the limit is found by substituting zero for Δx in the quotient. For example, if $f(x)=x^2$, we have

$$\frac{f(x+\Delta x)-f(x)}{\Delta x}=\frac{(x+\Delta x)^2-x^2}{\Delta x}=\frac{2x\Delta x+(\Delta x)^2}{\Delta x}=2x+\Delta x,$$

and

$$f'(x)=2x.$$

The process of forming the derived function of a given function is called *differentiation*. The fraction $\Delta y/\Delta x$ is called the "quotient of differences," and its limit dy/dx is called the "differential coefficient of y with respect to x." The rules for forming differential coefficients constitute the *differential calculus*.

The problem of tangents is solved at one stroke by the formation of the differential coefficient; and the problem of maxima and minima is solved, apart from the discrimination of maxima from minima and some further refinements, by equating the differential coefficient to zero (see MAXIMA AND MINIMA).

Integration.

5. The *problem of quadratures* leads to a type of limiting process which may be described as follows: Let $y=f(x)$ be the equation of a curve, and let AC and BD be the ordinates of the points C and D (see fig. 3). Let a, b be the abscissae of these points. Let the segment AB be divided into a number of segments by means of intermediate points such as M, and let MN be one such segment. Let PM and QN be those ordinates of the curve which have M and N as their feet. On MN as base describe two rectangles, of which the heights are the greatest and least values of y which correspond to points on the arc PQ of the curve. In fig. 3 these are the rectangles RM, SN. Let the sum of the areas of such rectangles as RM be formed, and likewise the sum of the areas of such rectangles as SN. When the number of the points such as M is increased without limit, and the lengths of all the segments such as MN are diminished without limit, these two sums of areas tend to limits. When they tend to the same limit the curvilinear figure ACDB has an area, and the limit is the measure of this area (see § 33 below). The limit in question is the same whatever law may be adopted for inserting the points such as M between A and B, and for diminishing the lengths of the segments such as MN. Further, if P′ is any point on the arc PQ, and P′M′ is the ordinate of P′, we may construct a rectangle of which the height is P′M′ and the base is MN, and the limit of the sum of the areas of all such rectangles is the area of the figure as before. If x is the abscissa of P, $x+\Delta x$ that of Q, x' that of P′, the limit in question might be written

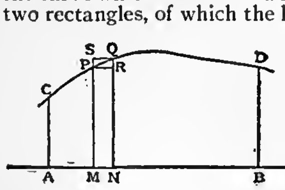

FIG. 3.

$$\lim.\sum_a^b f(x')\Delta x,$$

where the letters a, b written below and above the sign of summation Σ indicate the extreme values of x. This limit is called "the definite integral of $f(x)$ between the limits a and b," and the notation for it is

$$\int_a^b f(x)dx.$$

The germs of this method of formulating the problem of quadratures are found in the writings of Archimedes. The method leads to a definition of a definite integral, but the direct application of it to the evaluation of integrals is in general difficult. Any process for evaluating a definite integral is a process of integration, and the rules for evaluating integrals constitute the *integral calculus*.

Theorem of Inversion.

6. The chief of these rules is obtained by regarding the extreme ordinate BD as variable. Let ξ now denote the abscissa of B. The area A of the figure ACDB is represented by the integral $\int_a^\xi f(x)dx$, and it is a function of ξ. Let BD be displaced to B′D′ so that ξ becomes $\xi+\Delta\xi$ (see fig. 4). The area of the figure ACD′B′ is represented by the integral $\int_a^{\xi+\Delta\xi}f(x)dx$, and the increment ΔA of the area is given by the formula

$$\Delta A=\int_\xi^{\xi+\Delta\xi}f(x)dx,$$

which represents the area BDD′B′. This area is intermediate between those of two rectangles, having as a common base the segment BB′, and as heights the greatest and least ordinates of points on the arc DD′ of the curve. Let these heights be H and h. Then ΔA is intermediate between H$\Delta\xi$ and $h\Delta\xi$, and the quotient of differences $\Delta A/\Delta\xi$ is intermediate between H and h. If the function $f(x)$ is continuous at B (see FUNCTION), then, as $\Delta\xi$ is diminished without limit, H and h tend to BD, or $f(\xi)$, as a limit, and we have

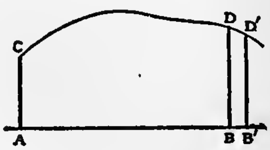

FIG. 4.

$$\frac{dA}{d\xi}=f(\xi).$$

The introduction of the process of differentiation, together with the theorem here proved, placed the solution of the problem of quadratures on a new basis. It appears that we can always find the area A if we know a function F (x) which has $f(x)$ as its differential coefficient. If $f(x)$ is continuous between a and b, we can prove that

$$A=\int_a^b f(x)dx=F(b)-F(a).$$

When we recognize a function F(x) which has the property expressed by the equation

$$\frac{dF(x)}{dx}=f(x),$$

we are said to *integrate* the function $f(x)$, and F(x) is called the *indefinite integral* of $f(x)$ *with respect to* x, and is written

$$\int f(x)dx.$$

Differentials.

7. In the process of § 4 the increment Δy is not in general equal to the product of the increment Δx and the derived function $f'(x)$. In general we can write down an equation of the form

$$\Delta y=f'(x)\Delta x+R,$$

in which R is different from zero when Δx is different from zero; and then we have not only

$$\lim._{\Delta x=0}R=0,$$

but also

$$\lim._{\Delta x=0}\frac{R}{\Delta x}=0.$$

We may separate Δy into two parts: the part $f'(x)\Delta x$ and the part R. The part $f'(x)\Delta x$ alone is useful for forming the differential coefficient, and it is convenient to give it a name. It is called the *differential* of $f(x)$, and is written $df(x)$, or dy when y is written for $f(x)$. When this notation is adopted dx is written instead of Δx, and is called the "differential of x," so that we have

$$df(x)=f'(x)dx.$$

Thus the differential of an independent variable such as x is a finite difference; in other words it is any number we please. The differential of a dependent variable such as y, or of a function of the independent variable x, is the product of the differential of x and the differential coefficient or derived function. It is important to observe that the differential coefficient is not to be defined as the ratio of differentials, but the ratio of differentials is to be defined as the previously introduced differential coefficient. The differentials are either finite differences, or are so much of certain finite differences as are useful for forming differential coefficients.

Again let $F(x)$ be the indefinite integral of a continuous function $f(x)$, so that we have

$$\frac{dF(x)}{dx}=f(x),\ \int_a^b f(x)dx=F(b)-F(a).$$

When the points M of the process explained in § 5 are inserted between the points whose abscissae are a and b, we may take them to be $n-1$ in number, so that the segment AB is divided into n segments. Let $x_1, x_2, \ldots x_{n-1}$ be the abscissae of the points in order. The integral is the limit of the sum

$$f(a)\ (x_1-a)+f(x_1)\ (x_2-x_1)+\ldots+f(x_r)\ (x_{r+1}-x_r) + \ldots +f(x_{n-1})(b-x_{n-1}),$$

every term of which is a differential of the form $f(x)dx$. Further the integral is equal to the sum of differences

$$\{F(x_1)-F(a)\}+\{F(x_2)-F(x_1)\}+\ \ldots\ +\{F(x_{r+1})-F(x_r)\} + \ \ldots\ +\{F(b)-F(x_{n-1})\},$$

for this sum is $F(b)-F(a)$. Now the difference $F(x_{r+1})-F(x_r)$ is *not* equal to the differential $f(x_r)\ (x_{r+1}-x_r)$, but the sum of the differences is equal to the *limit* of the sum of these differentials. The differential may be regarded as so much of the difference as is required to form the integral. From this point of view a differential is called a *differential element of an integral*, and the integral is the limit of the sum of differential elements. In like manner the differential element ydx of the area of a curve (§ 5) is not the area of the portion contained between two ordinates, however near together, but is so much of this area as need be retained for the purpose of finding the area of the curve by the limiting process described.

8. The notation of the infinitesimal calculus is intimately bound up with the notions of differentials and sums of elements. The letter

Notation. "d" is the initial letter of the word *differentia* (difference) and the symbol "$\int$" is a conventionally written "S," the initial letter of the word *summa* (sum or whole). The notation was introduced by Leibnitz (see §§ 25-27, below).

9. The fundamental artifice of the calculus is the artifice of forming differentials without first forming differential coefficients. From an

Fundamental Artifice. equation containing x and y we can deduce a new equation, containing also Δx and Δy, by substituting $x+\Delta x$ for x and $y+\Delta y$ for y. If there is a differential coefficient of y with respect to x, then Δy can be expressed in the form $\phi.\Delta x+R$, where $\lim._{\Delta x=0}(R/\Delta x)=0$, as in § 7 above. The artifice consists in rejecting *ab initio* all terms of the equation which belong to R. We do not form R at all, but only $\phi.\Delta x$, or $\phi.\ dx$, which is the differential dy. In the same way, in all applications of the integral calculus to geometry or mechanics we form the *element* of an integral in the same way as the element of area $y.\,dx$ is formed. In fig. 3 of § 5 the element of area $y.\,dx$ is the area of the rectangle RM. The actual area of the curvilinear figure PQNM is greater than the area of this rectangle by the area of the curvilinear figure PQR; but the excess is less than the area of the rectangle PRQS, which is measured by the product of the numerical measures of MN and QR, and we have

$$\lim._{MN=0}\frac{MN.QR}{MN}=0.$$

Thus the artifice by which differential elements of integrals are formed is in principle the same as that by which differentials are formed without first forming differential coefficients.

10. This principle is usually expressed by introducing the notion of orders of small quantities. If x, y are two variable numbers which are

Orders of small quantities. connected together by any relation, and if when x tends to zero y also tends to zero, the fraction y/x may tend to a finite limit. In this case x and y are said to be "of the same order." When this is not the case we may have either

$$\lim._{x=0}\frac{x}{y}=0,$$

or

$$\lim._{x=0}\frac{y}{x}=0.$$

In the former case y is said to be "of a lower order" than x; in the latter case y is said to be "of a higher order" than x. In accordance with this notion we may say that the fundamental artifice of the infinitesimal calculus consists in the rejection of small quantities of an unnecessarily high order. This artifice is now merely an incident in the conduct of a limiting process, but in the 17th century, when limiting processes other than the Greek methods for quadratures were new, the introduction of the artifice was a great advance.

11. By the aid of this artifice, or directly by carrying out

Rules of Differentiation. the appropriate limiting processes, we may obtain the rules by which differential coefficients are formed. These rules may be classified as "formal rules" and "particular results." The formal rules may be stated as follows:—

(i.) The differential coefficient of a *constant* is zero.

(ii.) For a *sum* $u+v+\ \ldots\ +z$, where u, v,...are functions of x,

$$\frac{d(u+v+\ \ldots\ +z)}{dx}=\frac{du}{dx}+\frac{dv}{dx}+\ \ldots\ +\frac{dz}{dx}.$$

(iii.) For a *product* uv

$$\frac{d(uv)}{dx}=u\frac{dv}{dx}+v\frac{du}{dx}.$$

(iv.) For a *quotient* u/v

$$\frac{d(u/v)}{dx}=\left(v\frac{du}{dx}-u\frac{dv}{dx}\right)\Big/v^2.$$

(v.) For a *function of a function*, that is to say, for a function y expressed in terms of a variable z, which is itself expressed as a function of x,

$$\frac{dy}{dx}=\frac{dy}{dz}\cdot\frac{dz}{dx}.$$

In addition to these formal rules we have particular results as to the differentiation of simple functions. The most important results are written down in the following table:—

y	$\frac{dy}{dx}$
x^n	nx^{n-1} for all values of n
$\log_a x$	$x^{-1}\log_a e$
a^x	$a^x\log_e a$
$\sin x$	$\cos x$
$\cos x$	$-\sin x$
$\sin^{-1}x$	$(1-x^2)^{-\frac{1}{2}}$
$\tan^{-1}x$	$(1+x^2)^{-1}$

Each of the formal rules, and each of the particular results in the table, is a theorem of the differential calculus. All functions (or rather expressions) which can be made up from those in the table by a finite number of operations of addition, subtraction, multiplication or division can be differentiated by the formal rules. All such functions are called *explicit* functions. In addition to these we have *implicit* functions, or such as are determined by an equation containing two variables when the equation cannot be solved so as to exhibit the one variable expressed in terms of the other. We have also functions of several variables. Further, since the derived function of a given function is itself a function, we may seek to differentiate it, and thus there arise the second and higher differential coefficients. We postpone for the present the problems of differential calculus which arise from these considerations. Again, we may have explicit functions which are expressed as the results of limiting operations, or by the limits of the results obtained by performing an infinite number of algebraic operations upon the simple functions. For the problem of differentiating such functions reference may be made to FUNCTION.

12. The processes of the integral calculus consist largely in trans-

Indefinite Integrals. formations of the functions to be integrated into such forms that they can be recognized as differential coefficients of functions which have previously been differentiated. Corresponding to the results in the table of § 11 we have those in the following table:—

$f(x)$	$\int f(x)dx$
x^n	$\frac{x^{n+1}}{n+1}$ for all values of n except -1
$\frac{1}{x}$	$\log_e x$
e^{ax}	$a^{-1}e^{ax}$
$\cos x$	$\sin x$
$\sin x$	$-\cos x$
$(a^2-x^2)^{-\frac{1}{2}}$	$\sin^{-1}\frac{x}{a}$
$\frac{1}{a^2+x^2}$	$\frac{1}{a}\tan^{-1}\frac{x}{a}$

The formal rules of § 11 give us means for the transformation of integrals into recognizable forms. For example, the rule (ii.) for a sum leads to the result that the integral of a sum of a finite number of terms is the sum of the integrals of the several terms. The rule (iii.) for a product leads to the method of integration by parts. The rule (v.) for a function of a function leads to the method of substitution (see § 48 below).

II. *History.*

Kepler's methods of integration.

13. The new limiting processes which were introduced in the development of the higher analysis were in the first instance related to problems of the integral calculus. Johannes Kepler in his *Astronomia nova . . . de motibus stellae Martis* (1609) stated his laws of planetary motion, to the effect that the orbits of the planets are ellipses with the sun at a focus, and that the radii vectores drawn from the sun to the planets describe equal areas in equal times. From these statements it is to be concluded that Kepler could measure the areas of focal sectors of an ellipse. When he made out these laws there was no method of evaluating areas except the Greek methods. These methods would have sufficed for the purpose, but Kepler invented his own method. He regarded the area as measured by the "sum of the radii" drawn from the focus, and he verified his laws of planetary motion by actually measuring a large number of radii of the orbit, spaced according to a rule, and adding their lengths.

He had observed that the focal radius vector SP (fig. 5) is equal to the perpendicular SZ drawn from S to the tangent at p to the auxiliary circle, and he had further established the theorem which we should now express in the form—the differential element of the area ASp as Sp turns about S, is equal to the product of SZ and the differential $ad\phi$, where a is the radius of the auxiliary circle, and ϕ is the angle ACp, that is the eccentric angle of P on the ellipse. The area ASP bears to the area ASp the ratio of the minor to the major axis, a result known to Archimedes. Thus Kepler's radii are spaced according to the rule that the eccentric angles of their ends are equidifferent, and his "sum of radii" is proportional to the expression which we should now write

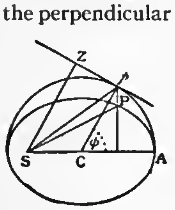

Fig. 5.

$$\int_0^\phi (a+ae\cos\phi)d\phi,$$

where e is the eccentricity. Kepler evaluated the sum as proportional to $\phi+e\sin\phi$.

Kepler soon afterwards occupied himself with the volumes of solids. The vintage of the year 1612 was extraordinarily abundant, and the question of the cubic content of wine casks was brought under his notice. This fact accounts for the title of his work, *Nova stereometria doliorum; accessit stereometriae Archimedeae supplementum* (1615). In this treatise he regarded solid bodies as being made up, as it were (*veluti*), of "infinitely" many "infinitely" small cones or "infinitely" thin disks, and he used the notion of summing the areas of the disks in the way he had previously used the notion of summing the focal radii of an ellipse.

Logarithms.

14. In connexion with the early history of the calculus it must not be forgotten that the method by which logarithms were invented (1614) was effectively a method of infinitesimals. Natural logarithms were not invented as the indices of a certain base, and the notation e for the base was first introduced by Euler more than a century after the invention. Logarithms were introduced as numbers which increase in arithmetic progression when other related numbers increase in geometric progression. The two sets of numbers were supposed to increase together, one at a uniform rate, the other at a variable rate, and the increments were regarded for purposes of calculation as very small and as accruing discontinuously.

Cavalieri's indivisibles.

15. Kepler's methods of integration, for such they must be called, were the origin of Bonaventura Cavalieri's theory of the summation of indivisibles. The notion of a continuum, such as the area within a closed curve, as being made up of indivisible parts, "atoms" of area, if the expression may be allowed, is traceable to the speculations of early Greek philosophers; and although the nature of continuity was better understood by Aristotle and many other ancient writers yet the unsound atomic conception was revived in the 13th century and has not yet been finally uprooted. It is possible to contend that Cavalieri did not himself hold the unsound doctrine, but his writing on this point is rather obscure. In his treatise *Geometria indivisibilibus continuorum nova quadam ratione promota* (1635) he regarded a plane figure as generated by a line moving so as to be always parallel to a fixed line, and a solid figure as generated by a plane moving so as to be always parallel to a fixed plane; and he compared the areas of two plane figures, or the volumes of two solids, by determining the ratios of the sums of all the indivisibles of which they are supposed to be made up, these indivisibles being segments of parallel lines equally spaced in the case of plane figures, and areas marked out upon parallel planes equally spaced in the case of solids. By this method Cavalieri was able to effect numerous integrations relating to the areas of portions of conic sections and the volumes generated by the revolution of these portions about various axes. At a later date, and partly in answer to an attack made upon him by Paul Guldin, Cavalieri published a treatise entitled *Exercitationes geometricae sex* (1647), in which he adapted his method to the determination of centres of gravity, in particular for solids of variable density.

Among the results which he obtained is that which we should now write

$$\int_0^x x^m dx = \frac{x^{m+1}}{m+1}, (m \text{ integral}).$$

He regarded the problem thus solved as that of determining the sum of the mth powers of all the lines drawn across a parallelogram parallel to one of its sides.

Successors of Cavalieri.

At this period scientific investigators communicated their results to one another through one or more intermediate persons. Such intermediaries were Pierre de Carcavy and Pater Marin Mersenne; and among the writers thus in communication were Bonaventura Cavalieri, Christiaan Huygens, Galileo Galilei, Giles Personnier de Roberval, Pierre de Fermat, Evangelista Torricelli, and a little later Blaise Pascal; but the letters of Carcavy or Mersenne would probably come into the hands of any man who was likely to be interested in the matters discussed. It often happened that, when some new method was invented, or some new result obtained, the method or result was quickly known to a wide circle, although it might not be printed until after the lapse of a long time. When Cavalieri was printing his two treatises there was much discussion of the problem of quadratures. Roberval (1634) regarded an area as made up of "infinitely" many "infinitely" narrow strips, each of which may be considered to be a rectangle, and he had similar ideas in regard to lengths and volumes. He knew how to approximate to the quantity which we express by $\int_0^1 x^m dx$ by the process of forming the sum

$$\frac{0^m+1^m+2^m+\ \dots\ (n-1)^m}{n^{m+1}},$$

and he claimed to be able to prove that this sum tends to $1/(m+1)$, as n increases for all positive integral values of m. The method of integrating x^m by forming this sum was found also by Fermat (1636), who stated expressly that he arrived at it by generalizing a method employed by Archimedes (for the cases $m=1$ and $m=2$) in his books on *Conoids and Spheroids* and on *Spirals* (see T. L. Heath, *The Works of Archimedes*, Cambridge, 1897). Fermat extended the result to the case where m is fractional (1644), and to the case where m is negative. This latter extension and the proofs were given in his memoir, *Proportionis geometricae in quadrandis parabolis et hyperbolis usus*, which appears to have received a final form before 1659, although not published until 1679. Fermat did not use fractional or negative indices, but he regarded his problems as the quadratures of parabolas and hyperbolas of various orders. His method was to divide the interval of integration into parts by means of intermediate points the abscissae of which are in geometric progression. In the process of § 5 above, the points M must be chosen according to this rule. This restrictive condition being understood, we may say that Fermat's formulation of the problem of quadratures is the same as our definition of a definite integral.

Fermat's method of Integration.

The result that the problem of quadratures could be solved for any curve whose equation could be expressed in the form

$$y=x^m (m \mp -1),$$

or in the form

$$y=a_1x^{m_1}+a_2x^{m_2}+\ \dots\ +a_nx^{m_n},$$

where none of the indices is equal to -1, was used by John Wallis in his *Arithmetica infinitorum* (1655) as well as by Fermat (1659). The case in which $m=-1$ was that of the ordinary rectangular hyperbola; and Gregory of St Vincent in his *Opus geometricum quadraturae circuli et sectionum coni* (1647) had proved by the method of exhaustions that the area contained between the curve, one asymptote, and two ordinates parallel to the other asymptote, increases in arithmetic progression as the distance between the ordinates (the one nearer to the centre being kept fixed) increases in geometric progression. Fermat described his method of integration as a logarithmic method, and thus it is clear that the relation between the quadrature of the hyperbola and logarithms was understood although it was not expressed analytically. It was not very long before the relation was used for the calculation of logarithms by Nicolaus Mercator in his *Logarithmotechnia* (1668). He began by writing the equation of the curve in the form $y=1/(1+x)$, expanded this expression in powers of x by the method of division, and integrated it term by term in accordance with the well-understood rule for finding the quadrature of a curve given by such an equation as that written at the foot of p. 325.

Various Integrations.

By the middle of the 17th century many mathematicians could perform integrations. Very many particular results had been obtained, and applications of them had been made to the quadrature of the circle and other conic sections, and to various problems concerning the lengths of curves, the areas they enclose, the volumes and superficial areas of solids, and centres of gravity. A systematic account of the methods then in use was given, along with much that was original on his part, by Blaise Pascal in his *Lettres de Amos Dettonville sur quelques-unes de ses inventions en géométrie* (1659).

Integration before the Integral Calculus.

16. The problem of maxima and minima and the problem of tangents had also by the same time been effectively solved. Oresme in the 14th century knew that at a point where the ordinate of a curve is a maximum or a minimum its variation from point to point of the curve is slowest; and Kepler in the *Stereometria doliorum* remarked that at the places where the ordinate passes from a smaller value to the greatest value and then again to a smaller value, its variation becomes insensible. Fermat in 1629 was in possession of a method which he then communicated to one Despagnet of Bordeaux, and which he referred to in a letter to Roberval of 1636. He communicated it to René Descartes early in 1638 on receiving a copy of Descartes's *Géométrie* (1637), and with it he sent to Descartes an account of his methods for solving the problem of tangents and for determining centres of gravity.

Fermat's methods of Differentiation.

Fermat's method for maxima and minima is essentially our method. Expressed in a more modern notation, what he did was to begin by connecting the ordinate y and the abscissa x of a point of a curve by an equation which holds at all points of the curve, then to subtract the value of y in terms of x from the value obtained by substituting $x+E$ for x, then to divide the difference by E, to put $E=0$ in the quotient, and to equate the quotient to zero. Thus he differentiated with respect to x and equated the differential coefficient to zero.

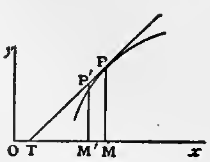

FIG. 6.

Fermat's method for solving the problem of tangents may be explained as follows:—Let (x, y) be the coordinates of a point P of a curve, (x', y'), those of a neighbouring point P′ on the tangent at P, and let $MM'=E$ (fig. 6).

From the similarity of the triangles P′TM′, PTM we have

$$y':A-E=y:A,$$

where A denotes the subtangent TM. The point P′ being near the curve, we may substitute in the equation of the curve $x-E$ for x and $(yA-yE)/A$ for y. The equation of the curve is approximately satisfied. If it is taken to be satisfied exactly, the result is an equation of the form $\phi(x, y, A, E)=0$, the left-hand member of which is divisible by E. Omitting the factor E, and putting $E=0$ in the remaining factor, we have an equation which gives A. In this problem of tangents also Fermat found the required result by a process equivalent to differentiation.

Fermat gave several examples of the application of his method; among them was one in which he showed that he could differentiate very complicated irrational functions. For such functions his method was to begin by obtaining a rational equation. In rationalizing equations Fermat, in other writings, used the device of introducing new variables, but he did not use this device to simplify the process of differentiation. Some of his results were published by Pierre Hérigone in his *Supplementum cursus mathematici* (1642). His communication to Descartes was not published in full until after his death (Fermat, *Opera varia*, 1679). Methods similar to Fermat's were devised by René de Sluse (1652) for tangents, and by Johannes Hudde (1658) for maxima and minima. Other methods for the solution of the problem of tangents were devised by Roberval and Torricelli, and published almost simultaneously in 1644. These methods were founded upon the composition of motions, the theory of which had been taught by Galileo (1638), and, less completely, by Roberval (1636). Roberval and Torricelli could construct the tangents of many curves, but they did not arrive at Fermat's artifice. This artifice is that which we have noted in §10 as the fundamental artifice of the infinitesimal calculus.

17. Among the comparatively few mathematicians who before 1665 could perform differentiations was Isaac Barrow. In his book entitled *Lectiones opticae et geometricae*, written apparently in 1663, 1664, and published in 1669, 1670, he gave a method of tangents like that of Roberval and Torricelli, compounding two velocities in the directions of the axes of x and y to obtain a resultant along the tangent to a curve. In an appendix to this book he gave another method which differs from Fermat's in the introduction of a differential equivalent to our dy as well as dx. Two neighbouring ordinates PM and QN of a curve (fig. 7) are regarded as containing an indefinitely small (*indefinite parvum*) arc, and PR is drawn parallel to the axis of x. The tangent PT at P is regarded as identical with the secant PQ, and the position of the tangent is determined by the similarity of the triangles PTM, PQR. The increments QR, PR of the ordinate and abscissa are denoted by a and e; and the ratio of a to e is determined by substituting $x+e$ for x and $y+a$ for y in the equation of the curve, rejecting all terms which are of order higher than the first in a and e, and omitting the terms which do not contain a or e. This process is equivalent to differentiation. Barrow appears to have invented it himself, but to have put it into his book at Newton's request. The triangle PQR is sometimes called "Barrow's differential triangle."

Barrow's Differential Triangle.

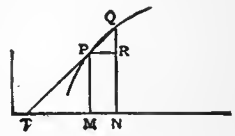

FIG. 7.

The reciprocal relation between differentiation and integration (§ 6) was first observed explicitly by Barrow in the book cited above. If the quadrature of a curve $y=f(x)$ is known, so that the area up to the ordinate x is given by $F(x)$, the curve $y=F(x)$ can be drawn, and Barrow showed that the subtangent of this curve is measured by the ratio of its ordinate to the ordinate of the original curve. The curve $y=F(x)$ is often called the "quadratrix" of the original curve; and the result has been called "Barrow's inversion-theorem." He did not use it as we do for the determination of quadratures, or indefinite integrals, but for the solution of problems of the kind which were then called "inverse problems of tangents." In these problems it was sought to determine a curve from some property of its tangent, *e.g.* the property that the subtangent is proportional to the square of the abscissa. Such problems are now classed under "differential equations." When Barrow wrote, quadratures were familiar and differentiation unfamiliar, just as hyperbolas were trusted while logarithms were strange. The functional notation was not invented till long afterwards (see FUNCTION), and the want of it is felt in reading all the mathematics of the 17th century.

Barrow's Inversion-theorem.

18. The great secret which afterwards came to be called the "infinitesimal calculus" was almost discovered by Fermat, and still more nearly by Barrow. Barrow went farther than Fermat in the theory of differentiation, though not in the practice, for he compared two increments; he went farther in the theory of integration, for he obtained the inversion-theorem. The great discovery seems to consist partly in the

recognition of the fact that differentiation, known to be a useful process, could always be performed, at least for the functions then known, and partly in the recognition of the fact that the inversion-theorem could be applied to problems of quadrature. By these steps the problem of tangents could be solved once for all, and the operation of integration, as we call it, could be rendered systematic. A further step was necessary in order that the discovery, once made, should become accessible to mathematicians in general; and this step was the introduction of a suitable notation. The definite abandonment of the old tentative methods of integration in favour of the method in which this operation is regarded as the inverse of differentiation was especially the work of Isaac Newton; the precise formulation of simple rules for the process of differentiation in each special case, and the introduction of the notation which has proved to be the best, were especially the work of Gottfried Wilhelm Leibnitz. This statement remains true although Newton invented a systematic notation, and practised differentiation by rules equivalent to those of Leibnitz, before Leibnitz had begun to work upon the subject, and Leibnitz effected integrations by the method of recognizing differential coefficients before he had had any opportunity of becoming acquainted with Newton's methods.

Nature of the discovery called the infinitesimal Calculus.

19. Newton was Barrow's pupil, and he knew to start with in 1664 all that Barrow knew, and that was practically all that was known about the subject at that time. His original thinking on the subject dates from the year of the great plague (1665–1666), and it issued in the invention of the "Calculus of Fluxions," the principles and methods of which were developed by him in three tracts entitled *De analysi per aequationes numero terminorum infinitas*, *Methodus fluxionum et serierum infinitarum*, and *De quadratura curvarum*. None of these was published until long after they were written. The *Analysis per aequationes* was composed in 1666, but not printed until 1711, when it was published by William Jones. The *Methodus fluxionum* was composed in 1671 but not printed till 1736, nine years after Newton's death, when an English translation was published by John Colson. In Horsley's edition of Newton's works it bears the title *Geometria analytica*. The *Quadratura* appears to have been composed in 1676, but was first printed in 1704 as an appendix to Newton's *Opticks*.

Newton's investigations.

20. The tract *De Analysi per aequationes* . . . was sent by Newton to Barrow, who sent it to John Collins with a request that it might be made known. One way of making it known would have been to print it in the *Philosophical Transactions* of the Royal Society, but this course was not adopted. Collins made a copy of the tract and sent it to Lord Brouncker, but neither of them brought it before the Royal Society. The tract contains a general proof of Barrow's inversion-theorem which is the same in principle as that in § 6 above. In this proof and elsewhere in the tract a notation is introduced for the momentary increment (*momentum*) of the abscissa or area of a curve; this "moment" is evidently meant to represent a moment of time, the abscissa representing time, and it is effectively the same as our differential element—the thing that Fermat had denoted by E, and Barrow by e, in the case of the abscissa. Newton denoted the moment of the abscissa by o, that of the area z by ov. He used the letter v for the ordinate y, thus suggesting that his curve is a velocity-time graph such as Galileo had used. Newton gave the formula for the area of a curve $v=x^m(m\mp-1)$ in the form $z=x^{m+1}/(m+1)$. In the proof he transformed this formula to the form $z^n=c^nx^p$, where n and p are positive integers, substituted $x+o$ for x and $z+ov$ for z, and expanded by the binomial theorem for a positive integral exponent, thus obtaining the relation

$$z^n+nz^{n-1}ov+\ldots=c^n(x^p+px^{p-1}o+\ldots),$$

from which he deduced the relation

$$nz^{n-1}v=c^npx^{p-1}$$

by omitting the equal terms z^n and c^nx^p and dividing the remaining terms by o, tacitly putting $o=0$ after division. This relation is the same as $v=x^m$. Newton pointed out that, conversely, from the relation $v=x^m$ the relation $z=x^{m+1}/(m+1)$ follows. He applied his formula to the quadrature of curves whose ordinates can be expressed as the sum of a finite number of terms of the form ax^m; and gave examples of its application to curves in which the ordinate is expressed by an infinite series, using for this purpose the binomial theorem for negative and fractional exponents, that is to say, the expansion of $(1+x)^n$ in an infinite series of powers of x. This theorem he had discovered; but he did not in this tract state it in a general form or give any proof of it. He pointed out, however, how it may be used for the solution of equations by means of infinite series. He observed also that all questions concerning lengths of curves, volumes enclosed by surfaces, and centres of gravity, can be formulated as problems of quadratures, and can thus be solved either in finite terms or by means of infinite series. In the *Quadratura* (1676) the method of integration which is founded upon the inversion-theorem was carried out systematically. Among other results there given is the quadrature of curves expressed by equations of the form $y=x^n(a+bx^m)^p$; this has passed into text-books under the title "integration of binomial differentials" (see § 49). Newton announced the result in letters to Collins and Oldenburg of 1676.

Newton's method of Series.

21. In the *Methodus fluxionum* (1671) Newton introduced his characteristic notation. He regarded variable quantities as generated by the motion of a point, or line, or plane, and called the generated quantity a "fluent" and its rate of generation a "fluxion." The fluxion of a fluent x is represented by $\dot{x}$, and its moment, or "infinitely" small increment accruing in an "infinitely" short time, is represented by $\dot{x}o$. The problems of the calculus are stated to be (i.) to find the velocity at any time when the distance traversed is given; (ii.) to find the distance traversed when the velocity is given. The first of these leads to differentiation. In any rational equation containing x and y the expressions $x+\dot{x}o$ and $y+\dot{y}o$ are to be substituted for x and y, the resulting equation is to be divided by o, and afterwards o is to be omitted. In the case of irrational functions, or rational functions which are not integral, new variables are introduced in such a way as to make the equations contain rational integral terms only. Thus Newton's rules of differentiation would be in our notation the rules (i.), (ii.), (v.) of § 11, together with the particular result which we write

Newton's method of Fluxions.

$$\frac{dx^m}{dx}=mx^{m-1},\ (m\ \text{integral}).$$

a result which Newton obtained by expanding $(x+\dot{x}o)^m$ by the binomial theorem. The second problem is the problem of integration, and Newton's method for solving it was the method of series founded upon the particular result which we write

$$\int x^m dx=\frac{x^{m+1}}{m+1}.$$

Newton added applications of his methods to maxima and minima, tangents and curvature. In a letter to Collins of date 1672 Newton stated that he had certain methods, and he described certain results which he had found by using them. These methods and results are those which are to be found in the *Methodus fluxionum*; but the letter makes no mention of fluxions and fluents or of the characteristic notation. The rule for tangents is said in the letter to be analogous to de Sluse's, but to be applicable to equations that contain irrational terms.

22. Newton gave the fluxional notation also in the tract *De Quadratura curvarum* (1676), and he there added to it notation for the higher differential coefficients and for indefinite integrals, as we call them. Just as $x, y, z, \ldots$ are fluents of which $\dot{x}, \dot{y}, \dot{z}, \ldots$ are the fluxions, so $\dot{x}, \dot{y}, \dot{z}, \ldots$ can be treated as fluents of which the fluxions may be denoted by $\ddot{x}, \ddot{y}, \ddot{z}, \ldots$ In like manner the fluxions of these may be denoted by $\dddot{x}, \dddot{y}, \dddot{z}, \ldots$ and so on. Again $x, y, z, \ldots$ may be regarded as fluxions of which the fluents may be denoted by $\acute{x}, \acute{y}, \acute{z}, \ldots$, and these again as fluxions of other quantities denoted by $\acute{\acute{x}}, \acute{\acute{y}}, \acute{\acute{z}}, \ldots$ and so on. No use was made of the notation $\acute{x}, \acute{\acute{x}}, \ldots$ in the course of the tract. The first publication of the fluxional notation was made by Wallis in the second edition of his *Algebra* (1693) in the form of extracts from communications made to him by Newton in 1692. In this account of the method the symbols $o, \dot{x}, \ddot{x}, \ldots$ occur, but not the symbols $\acute{x}, \acute{\acute{x}}, \ldots$ Wallis's treatise also contains Newton's formulation of the problems of the calculus in the words *Data aequatione fluentes quotcumque quantitates involvente fluxiones invenire et vice versa* ("an equation containing any number of fluent quantities being given, to find their fluxions and vice versa"). In the *Philosophiae naturalis principia mathematica* (1687), commonly called the "Principia," the words "fluxion" and "moment" occur in a lemma in the second book; but the notation which is characteristic of the calculus of fluxions is nowhere used.

Publication of the Fluxional Notation.

23. It is difficult to account for the fragmentary manner of publication of the Fluxional Calculus and for the long delays which took place. At the time (1671) when Newton composed the *Methodus fluxionum* he contemplated bringing out an edition of Gerhard Kinckhuysen's treatise on algebra and prefixing his tract to this treatise. In the same year his "Theory of Light and Colours" was published in the *Philosophical Transactions*, and the opposition which it excited led to the abandonment of

Retarded Publication of the method of Fluxions.

the project with regard to fluxions. In 1680 Collins sought the assistance of the Royal Society for the publication of the tract, and this was granted in 1682. Yet it remained unpublished. The reason is unknown; but it is known that about 1679, 1680, Newton took up again the studies in natural philosophy which he had intermitted for several years, and that in 1684 he wrote the tract *De motu* which was in some sense a first draft of the *Principia*, and it may be conjectured that the fluxions were held over until the *Principia* should be finished. There is also reason to think that Newton had become dissatisfied with the arguments about infinitesimals on which his calculus was based. In the preface to the *De quadratura curvarum* (1704), in which he describes this tract as something which he once wrote ("*olim scripsi*") he says that there is no necessity to introduce into the method of fluxions any argument about infinitely small quantities; and in the *Principia* (1687) he adopted instead of the method of fluxions a new method, that of "Prime and Ultimate Ratios." By the aid of this method it is possible, as Newton knew, and as was afterwards seen by others, to found the calculus of fluxions on an irreproachable method of limits. For the purpose of explaining his discoveries in dynamics and astronomy Newton used the method of limits only, without the notation of fluxions, and he presented all his results and demonstrations in a geometrical form. There is no doubt that he arrived at most of his theorems in the first instance by using the method of fluxions. Further evidence of Newton's dissatisfaction with arguments about infinitely small quantities is furnished by his tract *Methodus differentialis*, published in 1711 by William Jones, in which he laid the foundations of the "Calculus of Finite Differences."

Leibnitz's course of discovery.

24. Leibnitz, unlike Newton, was practically a self-taught mathematician. He seems to have been first attracted to mathematics as a means of symbolical expression, and on the occasion of his first visit to London, early in 1673, he learnt about the doctrine of infinite series which James Gregory, Nicolaus Mercator, Lord Brouncker and others, besides Newton, had used in their investigations. It appears that he did not on this occasion become acquainted with Collins, or see Newton's *Analysis per aequationes*, but he purchased Barrow's *Lectiones*. On returning to Paris he made the acquaintance of Huygens, who recommended him to read Descartes' *Géométrie*. He also read Pascal's *Lettres de Dettonville*, Gregory of St Vincent's *Opus geometricum*, Cavalieri's *Indivisibles* and the *Synopsis geometrica* of Honoré Fabri, a book which is practically a commentary on Cavalieri; it would never have had any importance but for the influence which it had on Leibnitz's thinking at this critical period. In August of this year (1673) he was at work upon the problem of tangents, and he appears to have made out the nature of the solution—the method involved in Barrow's differential triangle—for himself by the aid of a diagram drawn by Pascal in a demonstration of the formula for the area of a spherical surface. He saw that the problem of the relation between the differences of neighbouring ordinates and the ordinates themselves was the important problem, and then that the solution of this problem was to be effected by quadratures. Unlike Newton, who arrived at differentiation and tangents through integration and areas, Leibnitz proceeded from tangents to quadratures. When he turned his attention to quadratures and indivisibles, and realized the nature of the process of finding areas by summing "infinitesimal" rectangles, he proposed to replace the rectangles by triangles having a common vertex, and obtained by this method the result which we write

$$\tfrac{1}{4}\pi = 1 - \tfrac{1}{3} + \tfrac{1}{5} - \tfrac{1}{7} + \ldots$$

In 1674 he sent an account of his method, called "transmutation," along with this result to Huygens, and early in 1675 he sent it to Henry Oldenburg, secretary of the Royal Society, with inquiries as to Newton's discoveries in regard to quadratures. In October of 1675 he had begun to devise a symbolical notation for quadratures, starting from Cavalieri's indivisibles. At first he proposed to use the word *omnia* as an abbreviation for Cavalieri's "sum of all the lines," thus writing *omnia y* for that which we write "$\int y dx$," but within a day or two he wrote "$\int y$." He regarded the symbol "$\int$" as representing an operation which raises the dimensions of the subject of operation—a line becoming an area by the operation—and he devised his symbol "d" to represent the inverse operation, by which the dimensions are diminished. He observed that, whereas "$\int$" represents "sum," "d" represents "difference." His notation appears to have been practically settled before the end of 1675, for in November he wrote $\int y dy = \tfrac{1}{2}y^2$, just as we do now.

Correspondence of Newton and Leibnitz.

25. In July of 1676 Leibnitz received an answer to his inquiry in regard to Newton's methods in a letter written by Newton to Oldenburg. In this letter Newton gave a general statement of the binomial theorem and many results relating to series. He stated that by means of such series he could find areas and lengths of curves, centres of gravity and volumes and surfaces of solids, but, as this would take too long to describe, he would illustrate it by examples. He gave no proofs. Leibnitz replied in August, stating some results which he had obtained, and which, as it seemed, could not be obtained easily by the method of series, and he asked for further information. Newton replied in a long letter to Oldenburg of the 24th of October 1676. In this letter he gave a much fuller account of his binomial theorem and indicated a method of proof. Further he gave a number of results relating to quadratures; they were afterwards printed in the tract *De quadratura curvarum*. He gave many other results relating to the computation of natural logarithms and other calculations in which series could be used. He gave a general statement, similar to that in the letter to Collins, as to the kind of problems relating to tangents, maxima and minima, &c., which he could solve by his method, but he concealed his formulation of the calculus in an anagram of transposed letters. The solution of the anagram was given eleven years later in the *Principia* in the words we have quoted from Wallis's *Algebra*. In neither of the letters to Oldenburg does the characteristic notation of the fluxional calculus occur, and the words "fluxion" and "fluent" occur only in anagrams of transposed letters. The letter of October 1676 was not despatched until May 1677, and Leibnitz answered it in June of that year. In October 1676 Leibnitz was in London, where he made the acquaintance of Collins and read the *Analysis per aequationes*, and it seems to have been supposed afterwards that he then read Newton's letter of October 1676, but he left London before Oldenburg received this letter. In his answer of June 1677 Leibnitz gave Newton a candid account of his differential calculus, nearly in the form in which he afterwards published it, and explained how he used it for quadratures and inverse problems of tangents. Newton never replied.

Leibnitz's Differential Calculus.

26. In the *Acta eruditorum* of 1684 Leibnitz published a short memoir entitled *Nova methodus pro maximis et minimis, itemque tangentibus, quae nec fractas nec irrationales quantitates moratur, et singulare pro illis calculi genus.* In this memoir the differential dx of a variable x, considered as the abscissa of a point of a curve, is said to be an arbitrary quantity, and the differential dy of a related variable y, considered as the ordinate of the point, is defined as a quantity which has to dx the ratio of the ordinate to the subtangent, and rules are given for operating with differentials. These are the rules for forming the differential of a constant, a sum (or difference), a product, a quotient, a power (or root). They are equivalent to our rules (i.)-(iv.) of § 11 and the particular result

$$d(x^m) = mx^{m-1}dx.$$

The rule for a function of a function is not stated explicitly but is illustrated by examples in which new variables are introduced, in much the same way as in Newton's *Methodus fluxionum*. In connexion with the problem of maxima and minima, it is noted that the differential of y is positive or negative according as y increases or decreases when x increases, and the discrimination of maxima from minima depends upon the sign of ddy, the differential of dy. In connexion with the problem of tangents the differentials are said to be proportional to the momentary increments of the abscissa and ordinate. A tangent is defined as a line joining two "infinitely" near points of a curve, and the "infinitely" small distances (*e.g.*, the distance between the feet of the ordinates of such points) are said to be expressible by means of the differentials (*e.g.*, dx). The method is illustrated by a few examples, and one example is given of its application to "inverse problems of tangents." Barrow's inversion-theorem and its application to quadratures are not mentioned. No proofs are given, but it is stated that they can be obtained easily by any one versed in such matters. The new methods in regard to differentiation which were contained in this memoir were the use of the second differential for the discrimination of maxima and minima, and the introduction of new variables for the purpose of differentiating complicated expressions. A greater novelty was the use of a letter (d), not as a symbol for a number or magnitude, but as a symbol of operation. None of these novelties account for the far-reaching effect which this memoir has had upon the development of mathematical analysis. This effect was a consequence of the simplicity and directness with which the rules of differentiation were stated. Whatever indistinctness might be felt to attach to the symbols, the processes for solving problems of tangents and of maxima and minima were reduced once for all to a definite routine.

27. This memoir was followed in 1686 by a second, entitled *De Geometria recondita et analysi indivisibilium atque infinitorum*, in which Leibnitz described the method of using his new differential calculus for the problem of quadratures. This was the first publication of the notation $\int ydx$. The new method was called *calculus summatorius*. The brothers Jacob (James) and Johann (John) Bernoulli were able by 1690 to begin to make substantial contributions to the development of the new calculus, and Leibnitz adopted their word "integral" in 1695, they at the same time adopting his symbol "$\int$." In 1696 the marquis de l'Hospital published the first treatise on the differential calculus with the title *Analyse des infiniment petits pour l'intelligence des lignes courbes*. The few references to fluxions in Newton's *Principia* (1687) must have been quite unintelligible to the mathematicians of the time, and the publication of the fluxional notation and calculus by Wallis in 1693 was too late to be effective. Fluxions had been supplanted before they were introduced.

Development of the Calculus.

The differential calculus and the integral calculus were rapidly developed in the writings of Leibnitz and the Bernoullis. Leibnitz (1695) was the first to differentiate a logarithm and an exponential, and John Bernoulli was the first to recognize the property possessed by an exponential (a^x) of becoming infinitely great in comparison with any power (x^n) when x is increased indefinitely. Roger Cotes (1722) was the first to differentiate a trigonometrical function. A great development of infinitesimal methods took place through the founding in 1696–1697 of the "Calculus of Variations" by the brothers Bernoulli.

28. The famous dispute as to the priority of Newton and Leibnitz in the invention of the calculus began in 1699 through the publication by Nicolas Fatio de Duillier of a tract in which he stated that Newton was not only the first, but by many years the first inventor, and insinuated that Leibnitz had stolen it. Leibnitz in his reply (*Acta Eruditorum*, 1700) cited Newton's letters and the testimony which Newton had rendered to him in the *Principia* as proofs of his independent authorship of the method. Leibnitz was especially hurt at what he understood to be an endorsement of Duillier's attack by the Royal Society, but it was explained to him that the apparent approval was an accident. The dispute was ended for a time. On the publication of Newton's tract *De quadratura curvarum*, an anonymous review of it, written, as has since been proved, by Leibnitz, appeared in the *Acta Eruditorum*, 1705. The anonymous reviewer said: "Instead of the Leibnitzian differences Newton uses and always has used fluxions . . . just as Honoré Fabri in his *Synopsis Geometrica* substituted steps of movements for the method of Cavalieri." This passage, when it became known in England, was understood not merely as belittling Newton by comparing him with the obscure Fabri, but also as implying that he had stolen his calculus of fluxions from Leibnitz. Great indignation was aroused; and John Keill took occasion, in a memoir on central forces which was printed in the *Philosophical Transactions* for 1708, to affirm that Newton was without doubt the first inventor of the calculus, and that Leibnitz had merely changed the name and mode of notation. The memoir was published in 1710. Leibnitz wrote in 1711 to the secretary of the Royal Society (Hans Sloane) requiring Keill to retract his accusation. Leibnitz's letter was read at a meeting of the Royal Society, of which Newton was then president, and Newton made to the society a statement of the course of his invention of the fluxional calculus with the dates of particular discoveries. Keill was requested by the society "to draw up an account of the matter under dispute and set it in a just light." In his report Keill referred to Newton's letters of 1676, and said that Newton had there given so many indications of his method that it could have been understood by a person of ordinary intelligence. Leibnitz wrote to Sloane asking the society to stop these unjust attacks of Keill, asserting that in the review in the *Acta Eruditorum* no one had been injured but each had received his due, submitting the matter to the equity of the Royal Society, and stating that he was persuaded that Newton himself would do him justice. A committee was appointed by the society to examine the documents and furnish a report. Their report, presented in April 1712, concluded as follows:

Dispute concerning Priority.

> "The *differential method* is one and the same with the *method of fluxions*, excepting the name and mode of notation; Mr Leibnitz calling those quantities *differences* which Mr Newton calls *moments* or *fluxions*, and marking them with the letter *d*, a mark not used by Mr Newton. And therefore we take the proper question to be, not who invented this or that method, but who was the first inventor of the method; and we believe that those who have reputed Mr Leibnitz the first inventor, knew little or nothing of his correspondence with Mr Collins and Mr Oldenburg long before; nor of Mr Newton's having that method above fifteen years before Mr. Leibnitz began to publish it in the *Acta Eruditorum* of Leipzig. For which reasons we reckon Mr Newton the first inventor, and are of opinion that Mr Keill, in asserting the same, has been no ways injurious to Mr Leibnitz."

The report with the letters and other documents was printed (1712) under the title *Commercium Epistolicum D. Johannis Collins et aliorum de analysi promota, jussu Societatis Regiae in lucem editum*, not at first for publication. An account of the contents of the *Commercium Epistolicum* was printed in the *Philosophical Transactions* for 1715. A second edition of the *Commercium Epistolicum* was published in 1722. The dispute was continued for many years after the death of Leibnitz in 1716. To translate the words of Moritz Cantor, it "redounded to the discredit of all concerned."

29. One lamentable consequence of the dispute was a severance of British methods from continental ones. In Great Britain it became a point of honour to use fluxions and other Newtonian methods, while on the continent the notation of Leibnitz was universally adopted. This severance did not at first prevent a great advance in mathematics in Great Britain. So long as attention was directed to problems in which there is but one independent variable (the time, or the abscissa of a point of a curve), and all the other variables depend upon this one, the fluxional notation could be used as well as the differential and integral notation, though perhaps not quite so easily. Up to about the middle of the 18th century important discoveries continued to be made by the use of the method of fluxions. It was the introduction of partial differentiation by Leonhard Euler (1734) and Alexis Claude Clairaut (1739), and the developments which followed upon the systematic use of partial differential coefficients, which led to Great Britain being left behind; and it was not until after the reintroduction of continental methods into England by Sir John Herschel, George Peacock and Charles Babbage in 1815 that British mathematics began to flourish again. The exclusion of continental mathematics from Great Britain was not accompanied by any exclusion of British mathematics from the continent. The discoveries

British and Continental Schools of Mathematics.

of Brook Taylor and Colon Maclaurin were absorbed into the rapidly growing continental analysis, and the more precise conceptions reached through a critical scrutiny of the true nature of Newton's fluxions and moments stimulated a like scrutiny of the basis of the method of differentials.

Opposition to the calculus.

30. This method had met with opposition from the first. Christiaan Huygens, whose opinion carried more weight than that of any other scientific man of the day, declared that the employment of differentials was unnecessary, and that Leibnitz's second differential was meaningless (1691). A Dutch physician named Bernhard Nieuwentijt attacked the method on account of the use of quantities which are at one stage of the process treated as somethings and at a later stage as nothings, and he was especially severe in commenting upon the second and higher differentials (1694, 1695). Other attacks were made by Michel Rolle (1701), but they were directed rather against matters of detail than against the general principles. The fact is that, although Leibnitz in his answers to Nieuwentijt (1695), and to Rolle (1702), indicated that the processes of the calculus could be justified by the methods of the ancient geometry, he never expressed himself very clearly on the subject of differentials, and he conveyed, probably without intending it, the impression that the calculus leads to correct results by compensation of errors. In England the method of fluxions had to face similar attacks. George Berkeley, bishop and philosopher, wrote in 1734 a tract entitled *The Analyst; or a Discourse addressed to an Infidel Mathematician*, in which he proposed to destroy the presumption that the opinions of mathematicians in matters of faith are likely to be more trustworthy than those of divines, by contending that in the much vaunted fluxional calculus there are mysteries which are accepted unquestioningly by the mathematicians, but are incapable of logical demonstration. Berkeley's criticism was levelled against all infinitesimals, that is to say, all quantities vaguely conceived as in some intermediate state between nullity and finiteness, as he took Newton's moments to be conceived. The tract occasioned a controversy which had the important consequence of making it plain that all arguments about infinitesimals must be given up, and the calculus must be founded on the method of limits. During the controversy Benjamin Robins gave an exceedingly clear explanation of Newton's theories of fluxions and of prime and ultimate ratios regarded as theories of limits. In this explanation he pointed out that Newton's *moment* (Leibnitz's "differential") is to be regarded as so much of the actual difference between two neighbouring values of a variable as is needful for the formation of the fluxion (or differential coefficient) (see G. A. Gibson, "The Analyst Controversy," *Proc. Math. Soc.*, Edinburgh, xvii., 1899). Colin Maclaurin published in 1742 a *Treatise of Fluxions*, in which he reduced the whole theory to a theory of limits, and demonstrated it by the method of Archimedes. This notion was gradually transferred to the continental mathematicians. Leonhard Euler in his *Institutiones Calculi differentialis* (1755) was reduced to the position of one who asserts that all differentials are zero, but, as the product of zero and any finite quantity is zero, the ratio of two zeros can be a finite quantity which it is the business of the calculus to determine. Jean le Rond d'Alembert in the *Encyclopédie méthodique* (1755, 2nd ed. 1784) declared that differentials were unnecessary, and that Leibnitz's calculus was a calculus of mutually compensating errors, while Newton's method was entirely rigorous. D'Alembert's opinion of Leibnitz's calculus was expressed also by Lazare N. M. Carnot in his *Réflexions sur la métaphysique du calcul infinitésimal* (1799) and by Joseph Louis de la Grange (generally called Lagrange) in writings from 1760 onwards. Lagrange proposed in his *Théorie des fonctions analytiques* (1797) to found the whole of the calculus on the theory of series. It was not until 1823 that a treatise on the differential calculus founded upon the method of limits was published. The treatise was the *Résumé des leçons . . . sur le calcul infinitésimal* of Augustin Louis Cauchy. Since that time it has been understood that the use of the phrase "infinitely small" in any mathematical argument is a figurative mode of expression pointing to a limiting process. In the opinion of many eminent mathematicians such modes of expression are confusing to students, but in treatises on the calculus the traditional modes of expression are still largely adopted.

The "Analyst" controversy.

Cauchy's method of limits.

Arithmetical basis of modern analysis.

31. Defective modes of expression did not hinder constructive work. It was the great merit of Leibnitz's symbolism that a mathematician who used it knew what was to be done in order to formulate any problem analytically, even though he might not be absolutely clear as to the proper interpretation of the symbols, or able to render a satisfactory account of them. While new and varied results were promptly obtained by using them, a long time elapsed before the theory of them was placed on a sound basis. Even after Cauchy had formulated his theory much remained to be done, both in the rapidly growing department of complex variables, and in the regions opened up by the theory of expansions in trigonometric series. In both directions it was seen that rigorous demonstration demanded greater precision in regard to fundamental notions, and the requirement of precision led to a gradual shifting of the basis of analysis from geometrical intuition to arithmetical law. A sketch of the outcome of this movement—the "arithmetization of analysis," as it has been called—will be found in FUNCTION. Its general tendency has been to show that many theories and processes, at first accepted as of general validity, are liable to exceptions, and much of the work of the analysts of the latter half of the 19th century was directed to discovering the most general conditions in which particular processes, frequently but not universally applicable, can be used without scruple.

III. *Outlines of the Infinitesimal Calculus.*

32. The general notions of functionality, limits and continuity are explained in the article FUNCTION. Illustrations of the more immediate ways in which these notions present themselves in the development of the differential and integral calculus will be useful in what follows.

Geometrical limits.

33. Let y be given as a function of x, or, more generally, let x and y be given as functions of a variable t. The first of these cases is included in the second by putting $x=t$. If certain conditions are satisfied the aggregate of the points determined by the functional relations form a curve. The first condition is that the aggregate of the values of t to which values of x and y correspond must be continuous, or, in other words, that these values must consist of all real numbers, or of all those real numbers which lie between assigned extreme numbers. When this condition is satisfied the points are "ordered," and their order is determined by the order of the numbers t, supposed to be arranged in order of increasing or decreasing magnitude; also there are two senses of description of the curve, according as t is taken to increase or to diminish. The second condition is that the aggregate of the points which are determined by the functional relations must be "continuous." This condition means that, if any point P determined by a value of t is taken, and any distance δ, however small, is chosen, it is possible to find two points Q, Q′ of the aggregate which are such that (i.) P is between Q and Q′, (ii.) if R, R′ are any points between Q and Q′ the distance RR′ is less than δ. The meaning of the word "between" in this statement is fixed by the ordering of the points. Sometimes additional conditions are imposed upon the functional relations before they are regarded as defining a curve. An aggregate of points which satisfies the two conditions stated above is sometimes called a "Jordan curve." It by no means follows that every curve of this kind has a tangent. In order that the curve may have a tangent at P it is necessary that, if any angle α, however small, is specified, a distance δ can be found such that when P is between Q and Q′, and PQ and PQ′ are less than δ, the angle RPR′ is less than α for all pairs of points R, R′ which are between P and Q, or between P and Q′ (fig. 8). When this condition is satisfied y is a function of x which has a differential coefficient. The only way of

Tangents.

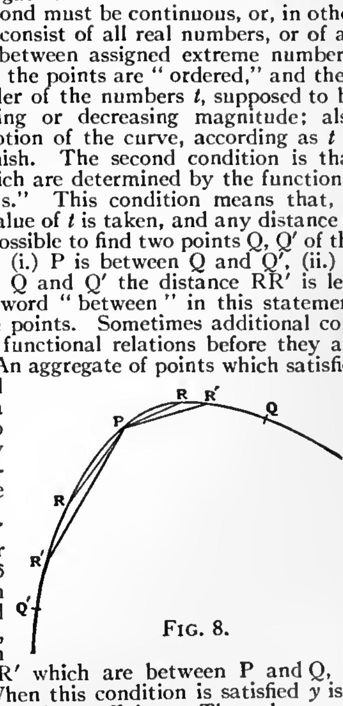

FIG. 8.

finding out whether this condition is satisfied or not is to attempt to form the differential coefficient. If the quotient of differences $\Delta y/\Delta x$ has a limit when Δx tends to zero, y is a differentiable function of x, and the limit in question is the differential coefficient. The derived function, or differential coefficient, of a function $f(x)$ is always defined by the formula

$$f'(x)=\frac{df(x)}{dx}=\lim._{h=0}\frac{f(x+h)-f(x)}{h}.$$

Rules for the formation of differential coefficients in particular cases have been given in §11 above. The definition of a differential coefficient, and the rules of differentiation, are quite independent of any geometrical interpretation, such as that concerning tangents to a curve, and the tangent to a curve is properly defined by means of the differential coefficient of a function, not the differential coefficient by means of the tangent.

Progressive and Regressive Differential Coefficients.

It may happen that the limit employed in defining the differential coefficient has one value when h approaches zero through positive values, and a different value when h approaches zero through negative values. The two limits are then called the "progressive" and "regressive" differential coefficients. In applications to dynamics, when x denotes a coordinate and t the time, dx/dt denotes a velocity. If the velocity is changed suddenly the progressive differential coefficient measures the velocity just after the change, and the regressive differential coefficient measures the velocity just before the change. Variable velocities are properly defined by means of differential coefficients.

Areas.

All geometrical limits may be specified in terms similar to those employed in specifying the tangent to a curve; in difficult cases they must be so specified. Geometrical intuition may fail to answer the question of the existence or non-existence of the appropriate limits. In the last resort the definitions of many quantities of geometrical import must be analytical, not geometrical. As illustrations of this statement we may take the definitions of the areas and lengths of curves. We may not assume that every curve has an area or a length. To find out whether a curve has an area or not, we must ascertain whether the limit expressed by $\int ydx$ exists. When the limit exists the curve has an area. The definition of the integral is quite independent of any geometrical interpretation. The length of a curve again is defined by means of a limiting process. Let P, Q be two points of a curve, and $R_1, R_2, \dots R_{n-1}$ a set of intermediate points of the curve, supposed to be described in the sense in which Q comes after P. The points R are supposed to be reached successively in the order of the suffixes when the curve is described in this sense. We form a sum of lengths of chords

$$PR_1+R_1R_2+\dots+R_{n-1}Q.$$

Lengths of Curves.

If this sum has a limit when the number of the points R is increased indefinitely and the lengths of all the chords are diminished indefinitely, this limit is the length of the arc PQ. The limit is the same whatever law may be adopted for inserting the intermediate points R and diminishing the lengths of the chords. It appears from this statement that the differential element of the arc of a curve is the length of the chord joining two neighbouring points. In accordance with the fundamental artifice for forming differentials (§§ 9, 10), the differential element of arc ds may be expressed by the formula

$$ds=\sqrt{\{(dx)^2+(dy)^2\}},$$

of which the right-hand member is really the measure of the distance between two neighbouring points on the tangent. The square root must be taken to be positive. We may describe this differential element as being so much of the actual arc between two neighbouring points as need be retained for the purpose of forming the integral expression for an arc. This is a description, not a definition, because the length of the short arc itself is only definable by means of the integral expression. Similar considerations to those used in defining the areas of plane figures and the lengths of plane curves are applicable to the formation of expressions for differential elements of volume or of the areas of curved surfaces.

Constants of Integration.

34. In regard to differential coefficients it is an important theorem that, if the derived function $f'(x)$ vanishes at all points of an interval, the function $f(x)$ is constant in the interval. It follows that, if two functions have the same derived function they can only differ by a constant. Conversely, indefinite integrals are indeterminate to the extent of an additive constant.

Higher Differential Coefficients.

35. The differential coefficient dy/dx, or the derived function $f'(x)$, is itself a function of x, and its differential coefficient is denoted by $f''(x)$ or d^2y/dx^2. In the second of these notations d/dx is regarded as the symbol of an operation, that of differentiation with respect to x, and the index 2 means that the operation is repeated. In like manner we may express the results of n successive differentiations by $f^{(n)}(x)$ or by d^ny/dx^n. When the second differential coefficient exists, or the first is differentiable, we have the relation

$$f''(x)=\lim._{h=0}\frac{f(x+h)-2f(x)+f(x-h)}{h^2} \qquad \text{(i.)}$$

The limit expressed by the right-hand member of this equation may exist in cases in which $f'(x)$ does not exist or is not differentiable. The result that, when the limit here expressed can be shown to vanish at all points of an interval, then $f(x)$ must be a linear function of x in the interval, is important.

The relation (i.) is a particular case of the more general relation

$$f^{(n)}(x)=\lim._{h=0}h^{-n}\Big[f(x+nh)-nf\{(x+(n-1)h\} + \frac{n(n-1)}{2\,!}f\{x+(n-2)h\}-\dots+(-1)^nf(x)\Big]. \qquad \text{(ii.)}$$

As in the case of relation (i.) the limit expressed by the right-hand member may exist although some or all of the derived functions $f'(x), f''(x), \dots f^{(n-1)}(x)$ do not exist.

Corresponding to the rule iii. of § 11 we have the rule for forming the nth differential coefficient of a product in the form

$$\frac{d^n(uv)}{dx^n}=u\frac{d^nv}{dx^n}+n\frac{du}{dx}\frac{d^{n-1}v}{dx^{n-1}}+\frac{n(n-1)}{1\,.\,2}\frac{d^2u}{dx^2}\frac{d^{n-2}v}{dx^{n-2}}+\dots+\frac{d^nu}{dx^n}v,$$

where the coefficients are those of the expansion of $(1+x)^n$ in powers of x (n being a positive integer). The rule is due to Leibnitz, (1695).

Differentials of higher orders may be introduced in the same way as the differential of the first order. In general when $y=f(x)$, the nth differential d^ny is defined by the equation

$$d^ny=f^{(n)}(x)(dx)^n,$$

in which dx is the (arbitrary) differential of x.

Symbols of operation.

When d/dx is regarded as a single symbol of operation the symbol $\int\dots dx$ represents the inverse operation. If the former is denoted by D, the latter may be denoted by D^{-1}. D^n means that the operation D is to be performed n times in succession; D^{-n} that the operation of forming the indefinite integral is to be performed n times in succession. Leibnitz's course of thought (§ 24) naturally led him to inquire after an interpretation of D^n where n is not an integer. For an account of the researches to which this inquiry gave rise, reference may be made to the article by A. Voss in *Ency. d. math. Wiss.* Bd. ii. A, 2 (Leipzig, 1889). The matter is referred to as "fractional" or "generalized" differentiation.

Theorem of Intermediate Value.

36. After the formation of differential coefficients the most important theorem of the differential calculus is the *theorem of intermediate value* ("theorem of mean value," "theorem of finite increments," "Rolle's theorem," are other names for it). This theorem may be explained as follows: Let A, B be two points of a curve $y=f(x)$ (fig. 9). Then there is a point P between A and B at which the tangent is parallel to the secant AB. This theorem is expressed analytically in the statement that if $f'(x)$ is continuous between a and b, there is a value x_1 of x between a and b which has the property expressed by the equation

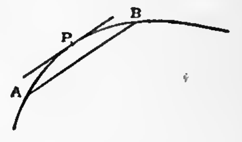

FIG. 9.

$$\frac{f(b)-f(a)}{b-a}=f'(x_1). \qquad \text{(i.)}$$

The value x_1 can be expressed in the form $a+\theta(b-a)$ where θ is a number between 0 and 1.

A slightly more general theorem was given by Cauchy (1823) to the effect that, if $f'(x)$ and $F'(x)$ are continuous between $x=a$ and $x=b$, then there is a number θ between 0 and 1 which has the property expressed by the equation

$$\frac{F(b)-F(a)}{f(b)-f(a)}=\frac{F'\{a+\theta(b-a)\}}{f'\{a+\theta(b-a)\}}.$$

The theorem expressed by the relation (i.) was first noted by Rolle (1690) for the case where $f(x)$ is a rational integral function which vanishes when $x=a$ and also when $x=b$. The general theorem was given by Lagrange (1797). Its fundamental importance was first recognized by Cauchy (1823). It may be observed here that the theorem of integral calculus expressed by the equation

$$F(b)-F(a)=\int_a^b F'(x)dx$$

follows at once from the definition of an integral and the theorem of intermediate value.

The theorem of intermediate value may be generalized in the statement that, if $f(x)$ and all its differential coefficients up to the nth inclusive are continuous in the interval between $x=a$ and $x=b$, then there is a number θ between 0 and 1 which has the property expressed by the equation

$$f(b)=f(a)+(b-a)f'(a)+\frac{(b-a)^2}{2\,!}f''(a)+\dots+\frac{(b-a)^{n-1}}{(n-1)\,!}f^{(n-1)}(a) + \frac{(b-a)^n}{n\,!}f^{(n)}\{a+\theta(b-a)\}. \qquad \text{(i.)}$$

Taylor's Theorem.

37. This theorem provides a means for computing the values of a function at points near to an assigned point when the value of the function and its differential coefficients at the assigned point are known. The function is expressed by a terminated series, and, when the remainder tends to zero as n increases, it may be transformed into an infinite series. The theorem

was first given by Brook Taylor in his *Methodus Incrementorum* (1717) as a corollary to a theorem concerning finite differences. Taylor gave the expression for $f(x+z)$ in terms of $f(x)$, $f'(x)$, ... as an infinite series proceeding by powers of z. His notation was that appropriate to the method of fluxions which he used. This rule for expressing a function as an infinite series is known as Taylor's theorem. The relation (i.), in which the remainder after n terms is put in evidence, was first obtained by Lagrange (1797). Another form of the remainder was given by Cauchy (1823) viz.,

$$\frac{(b-a)^n}{(n-1)!}(1-\theta)^{n-1}f^n\{a+\theta(b-a)\}.$$

The conditions of validity of Taylor's expansion in an infinite series have been investigated very completely by A. Pringsheim (*Math. Ann.* Bd. xliv., 1894). It is not sufficient that the function and all its differential coefficients should be finite at $x=a$; there must be a *neighbourhood* of a within which Cauchy's form of the remainder tends to zero as n increases (cf. FUNCTION).

An example of the necessity of this condition is afforded by the function $f(x)$ which is given by the equation

$$f(x)=\frac{1}{1+x^2}+\sum_{n=1}^{n=\infty}\frac{(-1)^n}{n!}\,\frac{1}{1+3^{2n}x^2}. \qquad \text{(i.)}$$

The sum of the series

$$f(0)+xf'(0)+\frac{x^2}{2!}f''(0)+\dots \qquad \text{(ii.)}$$

is the same as that of the series

$$e^{-1}-x^2e^{-3^2}+x^4e^{-3^4}-\dots$$

It is easy to prove that this is less than e^{-1} when x lies between 0 and 1, and also that $f(x)$ is greater than e^{-1} when $x=1/\sqrt{3}$. Hence the sum of the series (i.) is not equal to the sum of the series (ii.).

The particular case of Taylor's theorem in which $a=0$ is often called Maclaurin's theorem, because it was first explicitly stated by Colin Maclaurin in his *Treatise of Fluxions* (1742). Maclaurin like Taylor worked exclusively with the fluxional calculus.

Expansions in power series.

Examples of expansions in series had been known for some time. The series for $\log(1+x)$ was obtained by Nicolaus Mercator (1668) by expanding $(1+x)^{-1}$ by the method of algebraic division, and integrating the series term by term. He regarded his result as a "quadrature of the hyperbola." Newton (1669) obtained the expansion of $\sin^{-1}x$ by expanding $(1-x^2)^{-\frac{1}{2}}$ by the binomial theorem and integrating the series term by term. James Gregory (1671) gave the series for $\tan^{-1}x$. Newton also obtained the series for $\sin x$, $\cos x$, and e^x by reversion of series (1669). The symbol e for the base of the Napierian logarithms was introduced by Euler (1739). All these series can be obtained at once by Taylor's theorem. James Gregory found also the first few terms of the series for $\tan x$ and $\sec x$; the terms of these series may be found successively by Taylor's theorem, but the numerical coefficient of the general term cannot be obtained in this way.

Taylor's theorem for the expansion of a function in a power series was the basis of Lagrange's theory of functions, and it is fundamental also in the theory of analytic functions of a complex variable as developed later by Karl Weierstrass. It has also numerous applications to problems of maxima and minima and to analytical geometry. These matters are treated in the appropriate articles.

The forms of the coefficients in the series for $\tan x$ and $\sec x$ can be expressed most simply in terms of a set of numbers introduced by James Bernoulli in his treatise on probability entitled *Ars Conjectandi* (1713). These numbers B_1, B_2, ... called Bernoulli's numbers, are the coefficients so denoted in the formula

$$\frac{x}{e^x-1}=1-\frac{x}{2}+\frac{B_1}{2!}x^2-\frac{B_2}{4!}x^4+\frac{B_3}{6!}x^6-\dots,$$

and they are connected with the sums of powers of the reciprocals of the natural numbers by equations of the type

$$B_n=\frac{(2n)!}{2^{2n-1}\pi^{2n}}\left(\frac{1}{1^{2n}}+\frac{1}{2^{2n}}+\frac{1}{3^{2n}}+\dots\right).$$

The function

$$x^m-\frac{m}{2}x^{m-1}+\frac{m.m-1}{2!}B_1x^{m-2}-\dots$$

has been called Bernoulli's function of the mth order by J. L. Raabe (Crelle's *J. f. Math.* Bd. xlii., 1851). Bernoulli's numbers and functions are of especial importance in the calculus of finite differences (see the article by D. Seliwanoff in *Ency. d. math. Wiss.* Bd. i., E., 1901).

When x is given in terms of y by means of a power series of the form

$$x=y(C_0+C_1y+C_2y^2+\dots) \quad (C_0\neq 0)=yf_0(y),\text{ say,}$$

there arises the problem of expressing y as a power series in x. This problem is that of *reversion of series*. It can be shown that provided the absolute value of x is not too great,

$$y=\frac{x}{f_0(0)}+\sum_{n=2}^{n=\infty}\left[\frac{x^n}{n!}\cdot\frac{d^{n-1}}{dy^{n-1}}\,\frac{1}{\{f_0(y)\}^n}\right]_{y=0}$$

To this problem is reducible that of expanding y in powers of x when x and y are connected by an equation of the form

$$y=a+xf(y),$$

for which problem Lagrange (1770) obtained the formula

$$y=a+xf(a)+\sum_{n=2}^{n=\infty}\left[\frac{x^n}{n!}\cdot\frac{d^{n-1}}{da^{n-1}}\{f(a)\}^n\right].$$

For the history of the problem and the generalizations of Lagrange's result reference may be made to O. Stolz, *Grundzüge d. Diff. u. Int. Rechnung*, T. 2 (Leipzig, 1896).

Indeterminate forms.

38. An important application of the theorem of intermediate value and its generalization can be made to the problem of evaluating certain limits. If two functions $\phi(x)$ and $\psi(x)$ both vanish at $x=a$, the fraction $\phi(x)/\psi(x)$ may have a finite limit at a. This limit is described as the limit of an "indeterminate form." Such indeterminate forms were considered first by de l'Hospital (1696) to whom the problem of evaluating the limit presented itself in the form of tracing the curve $y=\phi(x)/\psi(x)$ near the ordinate $x=a$, when the curves $y=\phi(x)$ and $y=\psi(x)$ both cross the axis of x at the same point as this ordinate. In fig. 10 PA and QA represent short arcs of the curves ϕ, ψ, chosen so that P and Q have the same abscissa. The value of the ordinate of the corresponding point R of the compound curve is given by the ratio of the ordinates PM, QM. De l'Hospital treated PM and QM as "infinitesimal," so that the equations PM : AM $=\phi'(a)$ and QM : AM $=\psi'(a)$ could be assumed to hold, and he arrived at the result that the "true value" of $\phi(a)/\psi(a)$ is $\phi'(a)/\psi'(a)$. It can be proved rigorously that, if $\psi'(x)$ does not vanish at $x=a$, while $\phi(a)=0$ and $\psi(a)=0$, then

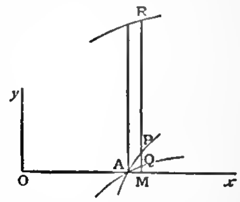

FIG. 10.

$$\lim._{x=a}\frac{\phi(x)}{\psi(x)}=\frac{\phi'(a)}{\psi'(a)}.$$

It can be proved further if that $\phi^m(x)$ and $\psi^n(x)$ are the differential coefficients of lowest order of $\phi(x)$ and $\psi(x)$ which do not vanish at $x=a$, and if $m=n$, then

$$\lim._{x=a}\frac{\phi(x)}{\psi(x)}=\frac{\phi^n(a)}{\psi^n(a)}.$$

If $m>n$ the limit is zero; but if $m<n$ the function represented by the quotient $\phi(x)/\psi(x)$ "becomes infinite" at $x=a$. If the value of the function at $x=a$ is not assigned by the definition of the function, the function does not exist at $x=a$, and the meaning of the statement that it "becomes infinite" is that it has no finite limit. The statement does not mean that the function has a value which we call infinity. There is no such value (see FUNCTION).

Such indeterminate forms as that described above are said to be of the form 0/0. Other indeterminate forms are presented in the form $0\times\infty$, or 1^∞, or ∞/∞, or $\infty-\infty$. The most notable of the forms 1^∞ is $\lim._{x=0}(1+x)^{1/x}$, which is e. The case in which $\phi(x)$ and $\psi(x)$ both tend to become infinite at $x=a$ is reducible to the case in which both the functions tend to become infinite when x is increased indefinitely. If $\phi'(x)$ and $\psi'(x)$ have determinate finite limits when x is increased indefinitely, while $\phi(x)$ and $\psi(x)$ are determinately (positively or negatively) infinite, we have the result expressed by the equation

$$\lim._{x=\infty}\frac{\phi(x)}{\psi(x)}=\frac{\lim._{x=\infty}\phi'(x)}{\lim._{x=\infty}\psi'(x)}.$$

For the meaning of the statement that $\phi(x)$ and $\psi(x)$ are determinately infinite reference may be made to the article FUNCTION. The evaluation of forms of the type ∞/∞ leads to a scale of increasing "infinities," each being infinite in comparison with the preceding. Such a scale is

$$\log x,\dots x,\ x^2,\dots x^n,\dots e^x,\dots x^x;$$

each of the limits expressed by such forms as $\lim._{x=\infty}\phi(x)/\psi(x)$, where $\phi(x)$ precedes $\psi(x)$ in the scale, is zero. The construction of such scales, along with the problem of constructing a complete scale, was discussed in numerous writings by Paul du Bois-Reymond (see in particular, *Math. Ann.* Bd. xi., 1877). For the general problem of indeterminate forms reference may be made to the article by A. Pringsheim in *Ency. d. math. Wiss.* Bd. ii., A. 1 (1899). Forms of the type 0/0 presented themselves to early writers on analytical geometry in connexion with the determination of the tangents at a double point of a curve; forms of the type ∞/∞ presented themselves in like manner in connexion with the determination of asymptotes of curves. The evaluation of limits has innumerable applications in all parts of analysis. Cauchy's *Analyse algébrique* (1821) was an epoch-making treatise on limits.

If a function $\phi(x)$ becomes infinite at $x=a$, and another function $\psi(x)$ also becomes infinite at $x=a$ in such a way that $\phi(x)/\psi(x)$ has a finite limit C, we say that $\phi(x)$ and $\psi(x)$ become "infinite of the same order." We may write $\phi(x)=C\psi(x)+\phi_1(x)$, where $\lim._{x=a}\phi_1(x)/\psi(x)=0$, and thus $\phi_1(x)$ is of a lower order than $\phi(x)$; it may be finite or infinite at $x=a$. If it is finite, we describe $C\psi(x)$

as the "infinite part" of $\phi(x)$. The resolution of a function which becomes infinite into an infinite part and a finite part can often be effected by taking the infinite part to be infinite of the same order as one of the functions in the scale written above, or in some more comprehensive scale. This resolution is the inverse of the process of evaluating an indeterminate form of the type $\infty - \infty$.

For example $\lim._{x=0}\{(e^x-1)^{-1}-x^{-1}\}$ is finite and equal to $=\frac{1}{2}$, and the function $(e^x-1)^{-1}-x^{-1}$ can be expanded in a power series in x.

39. The nature of a function of two or more variables, and the meaning to be attached to continuity and limits in respect of such functions, have been explained under FUNCTION. The theorems of differential calculus which relate to such functions are in general the same whether the number of variables is two or any greater number, and it will generally be convenient to state the theorems for two variables.

Functions of several variables.

40. Let u or $f(x, y)$ denote a function of two variables x and y. If we regard y as constant, u or f becomes a function of one variable x, and we may seek to differentiate it with respect to x. If the function of x is differentiable, the differential coefficient which is formed in this way is called the "partial differential coefficient" of u or f with respect to x, and is denoted by $\frac{\partial u}{\partial x}$ or $\frac{\partial f}{\partial x}$. The symbol "$\partial$" was appropriated for partial differentiation by C. G. J. Jacobi (1841). It had before been written indifferently with "d" as a symbol of differentiation. Euler had written "$\left(\frac{df}{dx}\right)$" for the partial differential coefficient of f with respect to x. Sometimes it is desirable to put in evidence the variable which is treated as constant, and then the partial differential coefficient is written "$\left(\frac{df}{dx}\right)_y$" or "$\left(\frac{\partial f}{\partial x}\right)_y$". This course is often adopted by writers on Thermodynamics. Sometimes the symbols d or ∂ are dropped, and the partial differential coefficient is denoted by u_x or f_x. As a definition of the partial differential coefficient we have the formula

Partial differentiation.

$$\frac{\partial f}{\partial x}=\lim._{h=0}\frac{f(x+h, y)-f(x, y)}{h}.$$

In the same way we may form the partial differential coefficient with respect to y by treating x as a constant.

The introduction of partial differential coefficients enables us to solve at once for a surface a problem analogous to the problem of tangents for a curve; and it also enables us to take the first step in the solution of the problem of maxima and minima for a function of several variables. If the equation of a surface is expressed in the form $z=f(x, y)$, the direction cosines of the normal to the surface at any point are in the ratios $\frac{\partial f}{\partial x}:\frac{\partial f}{\partial y}:-1$. If f is a maximum or a minimum at (x, y), then $\partial f/\partial x$ and $\partial f/\partial y$ vanish at that point.

In applications of the differential calculus to mathematical physics we are in general concerned with functions of three variables x, y, z, which represent the coordinates of a point; and then considerable importance attaches to partial differential coefficients which are formed by a particular rule. Let $F(x, y, z)$ be the function, P a point (x, y, z), P′ a neighbouring point $(x+\Delta x, y+\Delta y, z+\Delta z)$, and let Δs be the length of PP′. The value of $F(x, y, z)$ at P may be denoted shortly by F(P). A limit of the same nature as a partial differential coefficient is expressed by the formula

$$\lim._{\Delta s=0}\frac{F(P')-F(P)}{\Delta s},$$

in which Δs is diminished indefinitely by bringing P′ up to P, and P′ is supposed to approach P along a straight line, for example, the tangent to a curve or the normal to a surface. The limit in question is denoted by $\partial F/\partial h$, in which it is understood that h indicates a direction, that of PP′. If l, m, n are the direction cosines of the limiting direction of the line PP′, supposed drawn from P to P′, then

$$\frac{\partial F}{\partial h}=l\frac{\partial F}{\partial x}+m\frac{\partial F}{\partial y}+n\frac{\partial F}{\partial z}.$$

The operation of forming $\partial F/\partial h$ is called "differentiation with respect to an axis" or "vector differentiation."

41. The most important theorem in regard to partial differential coefficients is the *theorem of the total differential*. We may write down the equation

Theorem of the Total Differential.

$$f(a+h, b+k)-f(a, b)=f(a+h, b+k)-f(a, b+k)+f(a, b+k)-f(a, b).$$

If f_x is a continuous function of x when x lies between a and $a+h$ and $y=b+k$, and if further f_y is a continuous function of y when y lies between b and $d+k$, there exist values of θ and η which lie between 0 and 1 and have the properties expressed by the equations

$$f(a+h, b+k)-f(a, b+k)=hf_x(a+\theta h, b+k),$$
$$f(a, b+k)-f(a, b)=kf_y(a, b+\eta k).$$

Further, $f_x(a+\theta h, b+k)$ and $f_y(a, b+\eta k)$ tend to the limits $f_x(a, b)$ and $f_y(a, b)$ when h and k tend to zero, provided the differential coefficients f_x, f_y are continuous at the point (a, b). Hence in this case the above equation can be written

$$f(a+h, b+k)-f(a, b)=hf_x(a, b)+kf_y(a, b)+R,$$

where

$$\lim._{h=0,\ k=0}\frac{R}{h}=0 \text{ and } \lim._{h=0,\ k=0}\frac{R}{k}=0.$$

In accordance with the notation of differentials this equation gives

$$df=\frac{\partial f}{\partial x}dx+\frac{\partial f}{\partial y}dy.$$

Just as in the case of functions of one variable, dx and dy are arbitrary finite differences, and df is not the difference of two values of f, but is so much of this difference as need be retained for the purpose of forming differential coefficients.

The theorem of the total differential is immediately applicable to the differentiation of *implicit functions*. When y is a function of x which is given by an equation of the form $f(x, y)=0$, and it is either impossible or inconvenient to solve this equation so as to express y as an explicit function of x, the differential coefficient dy/dx can be formed without solving the equation. We have at once

$$\frac{dy}{dx}=-\frac{\partial f}{\partial x}\bigg/\frac{\partial f}{\partial y}.$$

This rule was known, in all essentials, to Fermat and de Sluse before the invention of the algorithm, of the differential calculus.

An important theorem, first proved by Euler, is immediately deducible from the theorem of the total differential. If $f(x, y)$ is a homogeneous function of degree n then

$$x\frac{\partial f}{\partial x}+y\frac{\partial f}{\partial y}=nf(x, y).$$

The theorem is applicable to functions of any number of variables and is generally known as *Euler's theorem of homogeneous functions*.

42. Many problems in which partial differential coefficients occur are simplified by the introduction of certain determinants called "Jacobians" or "functional determinants." They were introduced into Analysis by C. G. J. Jacobi (*J. f. Math.*, Crelle, Bd. 22, 1841, p. 319). The Jacobian of $u_1, u_2, \dots u_n$ with respect to $x_1, x_2, \dots x_n$ is the determinant

Jacobians.

$$\begin{vmatrix} \frac{\partial u_1}{\partial x_1} & \frac{\partial u_1}{\partial x_2} \cdots & \frac{\partial u_1}{\partial x_n} \\ \frac{\partial u_2}{\partial x_1} & \frac{\partial u_2}{\partial x_2} \cdots & \frac{\partial u_2}{\partial x_n} \\ \vdots & & \\ \frac{\partial u_n}{\partial x_1} & \frac{\partial u_n}{\partial x_2} \cdots & \frac{\partial u_n}{\partial x_n} \end{vmatrix}$$

in which the constituents of the rth row are the n partial differential coefficients of u_r with respect to the n variables x. This determinant is expressed shortly by

$$\frac{\partial(u_1, u_2, \dots, u_n)}{\partial(x_1, x_2, \dots, x_n)}.$$

Jacobians possess many properties analogous to those of ordinary differential coefficients, for example, the following:—

$$\frac{\partial(u_1, u_2, \dots, u_n)}{\partial(x_1, x_2, \dots, x_n)}\times\frac{\partial(x_1, x_2, \dots, x_n)}{\partial(u_1, u_2, \dots, u_n)}=1,$$
$$\frac{\partial(u_1, u_2, \dots, u_n)}{\partial(y_1, y_2, \dots, y_n)}\times\frac{\partial(y_1, y_2, \dots, y_n)}{\partial(x_1, x_2, \dots, x_n)}=\frac{\partial(u_1, u_2, \dots, u_n)}{\partial(x_1, x_2, \dots, x_n)}.$$

If n functions $(u_1, u_2, \dots u_n)$ of n variables $(x_1, x_2, \dots, x_n)$ are not independent, but are connected by a relation $f(u_1, u_2, \dots u_n)=0$, then

$$\frac{\partial(u_1, u_2, \dots, u_n)}{\partial(x_1, x_2, \dots, x_n)}=0;$$

and, conversely, when this condition is satisfied identically the functions $u_1, u_2, \dots, u_n$ are not independent.

43. Partial differential coefficients of the second and higher orders can be formed in the same way as those of the first order. For example, when there are two variables x, y, the first partial derivatives $\partial f/\partial x$ and $\partial f/\partial y$ are functions of x and y, which we may seek to differentiate partially with respect to x or y. The most important theorem in relation to partial differential coefficients of orders higher than the first is the theorem that the values of such coefficients do not depend upon the order in which the differentiations are performed. For example, we have the equation

Interchange of order of differentiations.

$$\frac{\partial}{\partial x}\left(\frac{\partial f}{\partial y}\right)=\frac{\partial}{\partial y}\left(\frac{\partial f}{\partial x}\right) \qquad \text{(i.)}$$

This theorem is not true without limitation. The conditions for its validity have been investigated very completely by H. A. Schwarz (see his *Ges. math. Abhandlungen*, Bd. 2, Berlin, 1890, p. 275). It is a sufficient, though not a necessary, condition that all the differential coefficients concerned should be continuous functions of x, y. In consequence of the relation (i.) the differential coefficients expressed in the two members of this relation are written

$$\frac{\partial^2 f}{\partial x\partial y} \text{ or } \frac{\partial^2 f}{\partial y\partial x}.$$

The differential coefficient

$$\frac{\partial^n f}{\partial x^p \partial y^q \partial z^r},$$

in which $p+q+r=n$, is formed by differentiating p times with respect to x, q times with respect to y, r times with respect to z, the differentiations being performed in any order. Abbreviated notations are sometimes used in such forms as

$$f_{x^p y^q z^r} \text{ or } f^{(p,q,r)}_{x,y,z}.$$

Differentials of higher orders are introduced by the defining equation

$$d^n f = \left(dx\frac{\partial}{\partial x}+dy\frac{\partial}{\partial y}\right)^n f$$
$$=(dx)^n\frac{\partial^n f}{\partial x^n}+n(dx)^{n-1}dy\frac{\partial^n f}{\partial x^{n-1}\partial y}+\dots$$

in which the expression $\left(dx\frac{\partial}{\partial x}+dy\frac{\partial}{\partial y}\right)^n$ is developed by the binomial theorem in the same way as if $dx\frac{\partial}{\partial x}$ and $dy\frac{\partial}{\partial y}$ were numbers, and $\left(\frac{\partial}{\partial x}\right)^r\left(\frac{\partial}{\partial y}\right)^{n-r}f$ is replaced by $\frac{\partial^n f}{\partial x^r \partial y^{n-r}}$. When there are more than two variables the multinomial theorem must be used instead of the binomial theorem.

The problem of forming the second and higher differential coefficients of *implicit functions* can be solved at once by means of partial differential coefficients. For example, if $f(x, y)=0$ is the equation defining y as a function of x, we have

$$\frac{d^2y}{dx^2}=\left(\frac{\partial f}{\partial y}\right)^{-3}\left\{\left(\frac{\partial f}{\partial y}\right)^2\frac{\partial^2 f}{\partial x^2}-2\frac{\partial f}{\partial x}\cdot\frac{\partial f}{\partial y}\cdot\frac{\partial^2 f}{\partial x\partial y}+\left(\frac{\partial f}{\partial x}\right)^2\frac{\partial^2 f}{\partial y^2}\right\}.$$

The differential expression $\mathrm{X}dx+\mathrm{Y}dy$, in which both X and Y are functions of the two variables x and y, is a *total differential* if there exists a function f of x and y which is such that

$$\partial f/\partial x=\mathrm{X},\ \partial f/\partial y=\mathrm{Y}.$$

When this is the case we have the relation

$$\partial \mathrm{Y}/\partial x=\partial X/\partial y. \qquad \text{(ii.)}$$

Conversely, when this equation is satisfied there exists a function f which is such that

$$df=\mathrm{X}dx+\mathrm{Y}dy.$$

The expression $\mathrm{X}dx+\mathrm{Y}dy$ in which X and Y are connected by the relation (ii.) is often described as a "perfect differential." The theory of the perfect differential can be extended to functions of n variables, and in this case there are $\frac{1}{2}n(n-1)$ such relations as (ii.).

In the case of a function of two variables x, y an abbreviated notation is often adopted for differential coefficients. The function being denoted by z, we write

$$p,\ q,\ r,\ s,\ t \text{ for } \frac{\partial z}{\partial x},\ \frac{\partial z}{\partial y},\ \frac{\partial^2 z}{\partial x^2},\ \frac{\partial^2 z}{\partial x\partial y},\ \frac{\partial^2 z}{\partial y^2}.$$

Partial differential coefficients of the second order are important in geometry as expressing the curvature of surfaces. When a surface is given by an equation of the form $z=f(x, y)$, the lines of curvature are determined by the equation

$$\{(1+q^2)s-pqt\}(dy)^2+\{(1+q^2)r-(1+p^2)t\}dxdy$$
$$-\{(1+p^2)s-pqr\}(dx)^2=0,$$

and the principal radii of curvature are the values of R which satisfy the equation

$$\mathrm{R}^2(rt-s^2)-\mathrm{R}\{(1+q^2)r-2pqs+(1+p^2)t\}\sqrt{(1+p^2+q^2)}$$
$$+(1+p^2+q^2)^2=0.$$

Change of variables.

44. The problem of change of variables was first considered by Brook Taylor in his *Methodus incrementorum*. In the case considered by Taylor y is expressed as a function of z, and z as a function of x, and it is desired to express the differential coefficients of y with respect to x without eliminating z. The result can be obtained at once by the rules for differentiating a product and a function of a function. We have

$$\frac{dy}{dx}=\frac{dy}{dz}\cdot\frac{dz}{dx},$$
$$\frac{d^2y}{dx^2}=\frac{dy}{dz}\cdot\frac{d^2z}{dx^2}+\frac{d^2y}{dz^2}\cdot\left(\frac{dz}{dx}\right)^2,$$
$$\frac{d^3y}{dx^3}=\frac{dy}{dz}\cdot\frac{d^3z}{dx^3}+3\frac{d^2y}{dz^2}\cdot\frac{dz}{dx}\cdot\frac{d^2z}{dx^2}+\frac{d^3y}{dz^3}\cdot\left(\frac{dz}{dx}\right)^3,$$

. . . .

The introduction of partial differential coefficients enables us to deal with more general cases of change of variables than that considered above. If u, v are new variables, and x, y are connected with them by equations of the type

$$x=f_1(u, v),\ \ y=f_2(u, v), \qquad \text{(i.)}$$

while y is either an explicit or an implicit function of x, we have the problem of expressing the differential coefficients of various orders of y with respect to x in terms of the differential coefficients of v with respect to u. We have

$$\frac{dy}{dx}=\left(\frac{\partial f_2}{\partial u}+\frac{\partial f_2}{\partial v}\frac{dv}{du}\right)\Big/\left(\frac{\partial f_1}{\partial u}+\frac{\partial f_1}{\partial v}\frac{dv}{du}\right)$$

by the rule of the total differential. In the same way, by means of differentials of higher orders, we may express d^2y/dx^2, and so on.

Equations such as (i.) may be interpreted as effecting a *transformation* by which a point (u, v) is made to correspond to a point (x, y). The whole theory of transformations, and of functions, or differential expressions, which remain invariant under groups of transformations, has been studied exhaustively by Sophus Lie (see, in particular, his *Theorie der Transformationsgruppen*, Leipzig, 1888–1893). (See also DIFFERENTIAL EQUATIONS and GROUPS).

A more general problem of change of variables is presented when it is desired to express the partial differential coefficients of a function V with respect to $x, y, \dots$ in terms of those with respect to $u, v, \dots$, where $u, v, \dots$ are connected with $x, y, \dots$ by any functional relations. When there are two variables x, y, and u, v are given functions of x, y, we have

$$\frac{\partial \mathrm{V}}{\partial x}=\frac{\partial \mathrm{V}}{\partial u}\frac{\partial u}{\partial x}+\frac{\partial \mathrm{V}}{\partial v}\frac{\partial v}{\partial x},$$
$$\frac{\partial \mathrm{V}}{\partial y}=\frac{\partial \mathrm{V}}{\partial u}\frac{\partial u}{\partial y}+\frac{\partial \mathrm{V}}{\partial v}\frac{\partial v}{\partial y},$$

and the differential coefficients of higher orders are to be formed by repeated applications of the rule for differentiating a product and the rules of the type

$$\frac{\partial}{\partial x}=\frac{\partial u}{\partial x}\frac{\partial}{\partial u}+\frac{\partial v}{\partial x}\frac{\partial}{\partial v}.$$

When x, y are given functions of $u, v, \dots$ we have, instead of the above, such equations as

$$\frac{\partial \mathrm{V}}{\partial u}=\frac{\partial \mathrm{V}}{\partial x}\frac{\partial x}{\partial u}+\frac{\partial \mathrm{V}}{\partial y}\frac{\partial y}{\partial u};$$

and $\partial\mathrm{V}/\partial x$, $\partial\mathrm{V}/\partial y$ can be found by solving these equations, provided the Jacobian $\partial(x, y)/\partial(u, v)$ is not zero. The generalization of this method for the case of more than two variables need not detain us.

In cases like that here considered it is sometimes more convenient not to regard the equations connecting x, y with u, v as effecting a point transformation, but to consider the loci $u=$const., $v=$const. as two "families" of curves. Then in any region of the plane of (x, y) in which the Jacobian $\partial(x, y)/\partial(u, v)$ does not vanish or become infinite, any point (x, y) is uniquely determined by the values of u and v which belong to the curves of the two families that pass through the point. Such variables as u, v are then described as "curvilinear coordinates" of the point. This method is applicable to any number of variables. When the loci $u=$const., . . . intersect each other at right angles, the variables are "orthogonal" curvilinear coordinates. Three-dimensional systems of such coordinates have important applications in mathematical physics. Reference may be made to G. Lamé, *Leçons sur les coordonnées curvilignes* (Paris, 1859), and to G. Darboux, *Leçons sur les coordonnées curvilignes et systèmes orthogonaux* (Paris, 1898).

When such a coordinate as u is connected with x and y by a functional relation of the form $f(x,y,u)=0$ the curves $u=$const. are a family of curves, and this family may be such that no two curves of the family have a common point. When this is not the case the points in which a curve $f(x, y, u)=0$ is intersected by a curve $f(x, y, u+\Delta u)=0$ tend to limiting positions as Δu is diminished indefinitely. The locus of these limiting positions is the "envelope" of the family, and in general it touches all the curves of the family. It is easy to see that, if u, v are the parameters of two families of curves which have envelopes, the Jacobian $\partial(x, y)/\partial(u, v)$ vanishes at all points on these envelopes. It is easy to see also that at any point where the reciprocal Jacobian $\partial(u, v)/\partial(x, y)$ vanishes, a curve of the family u touches a curve of the family v.

If three variables x, y, z are connected by a functional relation $f(x, y, z)=0$, one of them, z say, may be regarded as an *implicit function* of the other two, and the partial differential coefficients of z with respect to x and y can be formed by the rule of the total differential. We have

$$\frac{\partial z}{\partial x}=-\frac{\partial f}{\partial x}\Big/\frac{\partial f}{\partial z},\ \ \frac{\partial z}{\partial y}=-\frac{\partial f}{\partial y}\Big/\frac{\partial f}{\partial z};$$

and there is no difficulty in proceeding to express the higher differential coefficients. There arises the problem of expressing the partial differential coefficients of x with respect to y and z in terms of those of z with respect to x and y. The problem is known as that of "changing the dependent variable." It is solved by applying the rule of the total differential. Similar considerations are applicable to all cases in which n variables are connected by fewer than n equations.

Extension of Taylor's theorem.

45. Taylor's theorem can be extended to functions of several variables. In the case of two variables the general formula, with a remainder after n terms, can be written most simply in the form

$$f(a+h, b+k)=f(a, b)+df(a, b)+\frac{1}{2!}d^2f(a, b)+\dots$$
$$+\frac{1}{(n-1)!}d^{n-1}f(a, b)+\frac{1}{n!}d^nf(a+\theta h, b+\theta k),$$

in which

$$d^rf(a, b)=\left[\left(h\frac{\partial}{\partial x}+k\frac{\partial}{\partial y}\right)^r f(x, y)\right]_{x=a,\ y=b},$$

and $$d^n f(a+\theta h, b+\theta k) = \left[\left(h\frac{\partial}{\partial x}+k\frac{\partial}{\partial y}\right)^n f(x, y)\right]_{x=a+\theta h,\ y=b+\theta k}.$$
The last expression is the remainder after n terms, and in it θ denotes some particular number between 0 and 1. The results for three or more variables can be written in the same form. The extension of Taylor's theorem was given by Lagrange (1797); the form written above is due to Cauchy (1823). For the validity of the theorem in this form it is necessary that all the differential coefficients up to the nth should be continuous in a region bounded by $x=a\pm h$, $y=b\pm k$. When all the differential coefficients, no matter how high the order, are continuous in such a region, the theorem leads to an expansion of the function in a multiple power series. Such expansions are just as important in analysis, geometry and mechanics as expansions of functions of one variable. Among the problems which are solved by means of such expansions are the problem of maxima and minima for functions of more than one variable (see MAXIMA and MINIMA).

46. In treatises on the differential calculus much space is usually devoted to the differential geometry of curves and surfaces. A few remarks and results relating to the differential geometry of plane curves are set down here.

Plane curves.

(i.) If ψ denotes the angle which the radius vector drawn from the origin makes with the tangent to a curve at a point whose polar coordinates are r, θ and if p denotes the perpendicular from the origin to the tangent, then
$$\cos\psi = dr/ds,\ \sin\psi = rd\theta/ds = p/r,$$
where ds denotes the element of arc. The curve may be determined by an equation connecting p with r.

(ii.) The locus of the foot of the perpendicular let fall from the origin upon the tangent to a curve at a point is called the *pedal* of the curve with respect to the origin. The angle ψ for the pedal is the same as the angle ψ for the curve. Hence the (p,r) equation of the pedal can be deduced. If the pedal is regarded as the primary curve, the curve of which it is the pedal is the "negative pedal" of the primary. We may have pedals of pedals and so on, also negative pedals of negative pedals and so on. Negative pedals are usually determined as envelopes.

(iii.) If ϕ denotes the angle which the tangent at any point makes with a fixed line, we have
$$r^2 = p^2 + (dp/d\phi)^2.$$

(iv.) The "average curvature" of the arc Δs of a curve between two points is measured by the quotient
$$\left|\frac{\Delta\phi}{\Delta s}\right|$$
where the upright lines denote, as usual, that the absolute value of the included expression is to be taken, and ϕ is the angle which the tangent makes with a fixed line, so that $\Delta\phi$ is the angle between the tangents (or normals) at the points. As one of the points moves up to coincidence with the other this average curvature tends to a limit which is the "curvature" of the curve at the point. It is denoted by
$$\left|\frac{d\phi}{ds}\right|$$
Sometimes the upright lines are omitted and a rule of signs is given:—Let the arc s of the curve be measured from some point along the curve in a chosen sense, and let the normal be drawn towards that side to which the curve is concave; if the normal is directed towards the left of an observer looking along the tangent in the chosen sense of description the curvature is reckoned positive, in the contrary case negative. The differential $d\phi$ is often called the "angle of contingence." In the 14th century the size of the angle between a curve and its tangent seems to have been seriously debated, and the name "angle of contingence" was then given to the supposed angle.

(v.) The curvature of a curve at a point is the same as that of a certain circle which touches the curve at the point, and the "radius of curvature" ρ is the radius of this circle. We have $\frac{1}{\rho}=\left|\frac{d\phi}{ds}\right|$. The centre of the circle is called the "centre of curvature"; it is the limiting position of the point of intersection of the normal at the point and the normal at a neighbouring point, when the second point moves up to coincidence with the first. If a circle is described to intersect the curve at the point P and at two other points, and one of these two points is moved up to coincidence with P, the circle touches the curve at the point P and meets it in another point; the centre of the circle is then on the normal. As the third point now moves up to coincidence with P, the centre of the circle moves to the centre of curvature. The circle is then said to "osculate" the curve, or to have "contact of the second order" with it at P.

(vi.) The following are formulae for the radius of curvature:—
$$\frac{1}{\rho}=\left|\left\{1+\left(\frac{dy}{dx}\right)^2\right\}^{-\frac{3}{2}}\frac{d^2y}{dx^2}\right|,$$
$$\rho=\left|r\frac{dr}{dp}\right|=\left|p+\frac{d^2p}{d\phi^2}\right|.$$

(vii.) The points at which the curvature vanishes are "points of inflection." If P is a point of inflection and Q a neighbouring point, then, as Q moves up to coincidence with P, the distance from P to the point of intersection of the normals at P and Q becomes greater than any distance that can be assigned. The equation which gives the abscissae of the points in which a straight line meets the curve being expressed in the form $f(x)=0$, the function $f(x)$ has a factor $(x-x_0)^3$, where x_0 is the abscissa of the point of inflection P, and the line is the tangent at P. When the factor $(x-x_0)$ occurs $(n+1)$ times in $f(x)$, the curve is said to have "contact of the nth order" with the line. There is an obvious modification when the line is parallel to the axis of y.

(viii.) The locus of the centres of curvature, or envelope of the normals, of a curve is called the "evolute." A curve which has a given curve as evolute is called an "involute" of the given curve. All the involutes are "parallel" curves, that is to say, they are such that one is derived from another by marking off a constant distance along the normal. The involutes are "orthogonal trajectories" of the tangents to the common evolute.

(ix.) The equation of an algebraic curve of the nth degree can be expressed in the form $u_0+u_1+u_2+\ldots+u_n=0$, where u_0 is a constant, and u_r is a homogeneous rational integral function of x, y of the rth degree. When the origin is on the curve, u_0 vanishes, and $u_1=0$ represents the tangent at the origin. If u_1 also vanishes, the origin is a double point and $u_2=0$ represents the tangents at the origin. If u_2 has distinct factors, or is of the form $a(y-p_1x)(y-p_2x)$, the value of y on either branch of the curve can be expressed (for points sufficiently near the origin) in a power series, which is either
$$p_1x+\tfrac{1}{2}q_1x^2+\ldots,\ \text{or}\ p_2x+\tfrac{1}{2}q_2x^2+\ldots,$$
where $q_1,\ldots$ and $q_2,\ldots$ are determined without ambiguity. If p_1 and p_2 are real the two branches have radii of curvature ρ_1, ρ_2 determined by the formulae
$$\frac{1}{\rho_1}=\left|(1+p_1^2)^{-\frac{3}{2}}q_1\right|,\quad \frac{1}{\rho_2}=\left|(1+p_2^2)^{-\frac{3}{2}}q_2\right|.$$
When p_1 and p_2 are imaginary the origin is the real point of intersection of two imaginary branches. In the real figure of the curve it is an *isolated point*. If u_2 is a square, $a(y-px)^2$, the origin is a *cusp*, and in general there is not a series for y in integral powers of x, which is valid in the neighbourhood of the origin. The further investigation of cusps and multiple points belongs rather to analytical geometry and the theory of algebraic functions than to differential calculus.

(x.) When the equation of a curve is given in the form $u_0+u_1+\ldots+u_{n-1}+u_n=0$ where the notation is the same as that in (ix.), the factors of u_n determine the directions of the *asymptotes*. If these factors are all real and distinct, there is an asymptote corresponding to each factor. If $u_n=L_1L_2\ldots L_n$, where $L_1,\ldots$ are linear in x, y, we may resolve u_{n-1}/u_n into partial fractions according to the formula
$$\frac{u_{n-1}}{u_n}=\frac{A_1}{L_1}+\frac{A_2}{L_2}+\ldots+\frac{A_n}{L_n},$$
and then $L_1+A_1=0$, $L_2+A_2=0,\ldots$ are the equations of the asymptotes. When a real factor of u_n is repeated we may have two parallel asymptotes or we may have a "parabolic asymptote." Sometimes the parallel asymptotes coincide, as in the curve $x^2(x^2+y^2-a^2)=a^4$, where $x=0$ is the only real asymptote. The whole theory of asymptotes belongs properly to analytical geometry and the theory of algebraic functions.

47. The formal definition of an integral, the theorem of the existence of the integral for certain classes of functions, a list of classes of "integrable" functions, extensions of the notion of integration to functions which become infinite or indeterminate, and to cases in which the limits of integration become infinite, the definitions of multiple integrals, and the possibility of defining functions by means of definite integrals—all these matters have been considered in FUNCTION. The definition of integration has been explained in § 5 above, and the results of some of the simplest integrations have been given in § 12. A few theorems relating to integrations have been noted in §§ 34, 35, 36 above.

Integral calculus.

48. The chief methods for the evaluation of indefinite integrals are the method of integration by parts, and the introduction of new variables.

Methods of integration.

From the equation $d(uv)=udv+vdu$ we deduce the equation
$$\int u\frac{dv}{dx}dx = uv - \int v\frac{du}{dx}dx,$$
or, as it may be written
$$\int uwdx = u\int wdx - \int\frac{du}{dx}\left\{\int wdx\right\}dx.$$
This is the rule of "integration by parts."

As an example we have
$$\int xe^{ax}dx = x\frac{e^{ax}}{a} - \int\frac{e^{ax}}{a}dx = \left(\frac{x}{a}-\frac{1}{a^2}\right)e^{ax}.$$

When we introduce a new variable z in place of x, by means of an equation giving x in terms of z, we express $f(x)$ in terms of z. Let $\phi(z)$ denote the function of z into which $f(x)$ is transformed. Then from the equation
$$dx=\frac{dx}{dz}dz$$

we deduce the equation

$$\int f(x)dx = \int \phi(z)\frac{dx}{dz}dz.$$

As an example, in the integral

$$\int \sqrt{(1-x^2)}dx$$

put $x=\sin z$; the integral becomes

$$\int \cos z . \cos z dz = \int \tfrac{1}{2}(1+\cos 2z)dz = \tfrac{1}{2}(z+\tfrac{1}{2}\sin 2z) = \tfrac{1}{2}(z+\sin z\cos z).$$

Integration in terms of elementary functions.

49. The indefinite integrals of certain classes of functions can be expressed by means of a finite number of operations of addition or multiplication in terms of the so-called "elementary" functions. The elementary functions are rational algebraic functions, implicit algebraic functions, exponentials and logarithms, trigonometrical and inverse circular functions. The following are among the classes of functions whose integrals involve the elementary functions only: (i.) all rational functions; (ii.) all irrational functions of the form $f(x; y)$, where f denotes a rational algebraic function of x and y, and y is connected with x by an algebraic equation of the second degree; (iii.) all rational functions of $\sin x$ and $\cos x$; (iv.) all rational functions of e^x; (v.) all rational integral functions of the variables x, e^{ax}, e^{bx}, ... $\sin mx$, $\cos mx$, $\sin nx$, $\cos nx$, ... in which a, b, ... and m, n, ... are any constants. The integration of a rational function is generally effected by resolving the function into partial fractions, the function being first expressed as the quotient of two rational integral functions. Corresponding to any simple root of the denominator there is a logarithmic term in the integral. If any of the roots of the denominator are repeated there are rational algebraic terms in the integral. The operation of resolving a fraction into partial fractions requires a knowledge of the roots of the denominator, but the algebraic part of the integral can always be found without obtaining all the roots of the denominator. Reference may be made to C. Hermite, *Cours d'analyse*, Paris, 1873. The integration of other functions, which can be integrated in terms of the elementary functions, can usually be effected by transforming the functions into rational functions, possibly after preliminary integrations by parts. In the case of rational functions of x and a radical of the form $\sqrt{(ax^2+bx+c)}$ the radical can be reduced by a linear substitution to one of the forms $\sqrt{(a^2-x^2)}$, $\sqrt{(x^2-a^2)}$, $\sqrt{(x^2+a^2)}$. The substitutions $x=a\sin\theta$, $x=a\sec\theta$, $x=a\tan\theta$ are then effective in the three cases. By these substitutions the subject of integration becomes a rational function of $\sin\theta$ and $\cos\theta$, and it can be reduced to a rational function of t by the substitution $\tan\frac{1}{2}\theta=t$. There are many other substitutions by which such integrals can be determined. Sometimes we may have information as to the functional character of the integral without being able to determine it. For example, when the subject of integration is of the form $(ax^4+bx^3+cx^2+dx+e)^{-\frac{1}{2}}$ the integral cannot be expressed explicitly in terms of elementary functions. Such integrals lead to new functions (see FUNCTION).

Methods of reduction and substitution for the evaluation of indefinite integrals occupy a considerable space in text-books of the integral calculus. In regard to the functional character of the integral reference may be made to G. H. Hardy's tract, *The Integration of Functions of a Single Variable* (Cambridge, 1905), and to the memoirs there quoted. A few results are added here

(i.) $\int (x^2+a)^{-\frac{1}{2}}dx = \log\{x+(x^2+a)^{\frac{1}{2}}\}$.

(ii.) $\int \frac{dx}{(x-p)\sqrt{(ax^2+2bx+c)}}$ can be evaluated by the substitution $x-p=1/z$, and $\int \frac{dx}{(x-p)^n\sqrt{(ax^2+2bx+c)}}$ can be deduced by differentiating $(n-1)$ times with respect to p.

(iii.) $\int \frac{(\mathrm{H}x+\mathrm{K})dx}{(ax^2+2\beta x+\gamma)\sqrt{(ax^2+2bx+c)}}$ can be reduced by the substitution $y^2=(ax^2+2bx+c)/(ax^2+2\beta x+\gamma)$ to the form

$$\mathrm{A}\int\frac{dy}{\sqrt{(\lambda_1-y^2)}}+\mathrm{B}\int\frac{dy}{\sqrt{(y^2-\lambda_2)}}$$

where A and B are constants, and λ_1 and λ_2 are the two values of λ for which $(a-\lambda a)x^2+2(b-\lambda\beta)x+c-\lambda\gamma$ is a perfect square (see A. G. Greenhill, *A Chapter in the Integral Calculus*, London, 1888).

(iv.) $\int x^m(ax^n+b)^p dx$, in which m, n, p are rational, can be reduced, by putting $ax^n=bt$, to depend upon $\int t^q(1+t)^p dt$. If p is an integer and q a fraction r/s, we put $t=u^s$. If q is an integer and $p=r/s$ we put $1+t=u^s$. If $p+q$ is an integer and $p=r/s$ we put $1+t=tu^s$. These integrals, called "binomial integrals," were investigated by Newton (*De quadratura curvarum*).

(v.) $\int\frac{dx}{\sin x}=\log\tan\frac{x}{2}$, (vi.) $\int\frac{dx}{\cos x}=\log(\tan x+\sec x)$.

(vii.) $\int e^{ax}\sin(bx+a)dx=(a^2+b^2)^{-1}e^{ax}\{a\sin(bx+a)-b\cos(bx+a)\}$.

(viii.) $\int\sin^m x\cos^n x\,dx$ can be reduced by differentiating a function of the form $\sin^p x\cos^q x$;

$$e.g.\ \frac{d}{dx}\frac{\sin x}{\cos^q x}=\frac{1}{\cos^{q-1}x}+\frac{q\sin^2 x}{\cos^{q+1}x}=\frac{1-q}{\cos^{q-1}x}+\frac{q}{\cos^{q+1}x}.$$

Hence

$$\int\frac{dx}{\cos^n x}=\frac{\sin x}{(n-1)\cos^{n-1}x}+\frac{n-2}{n-1}\int\frac{dx}{\cos^{n-2}x}.$$

(ix.) $\int_0^{\frac{1}{2}\pi}\sin^{2n}x dx=\int_0^{\frac{1}{2}\pi}\cos^{2n}x dx=\frac{1.3\ldots(2n-1)}{2.4\ldots2n}\cdot\frac{\pi}{2}$, ($n$ an integer).

(x.) $\int_0^{\frac{1}{2}\pi}\sin^{2n+1}x dx=\int_0^{\frac{1}{2}\pi}\cos^{2n+1}x dx=\frac{2.4\ldots2n}{3.5\ldots(2n+1)}$, ($n$ an integer).

(xi.) $\int\frac{dx}{(1+e\cos x)^n}$ can be reduced by one of the substitutions

$$\cos\phi=\frac{e+\cos x}{1+e\cos x},\ \cosh u=\frac{e+\cos x}{1+e\cos x},$$

of which the first or the second is to be employed according as $e<$ or >1.

New transcendents.

50. Among the integrals of transcendental functions which lead to new transcendental functions we may notice

$$\int_0^x\frac{dx}{\log x},\ \text{or}\int_{-\infty}^{\log x}\frac{e^z}{z}dz,$$

called the "logarithmic integral," and denoted by "Li x," also the integrals

$$\int_0^x\frac{\sin x}{x}dx\ \text{and}\int_\infty^x\frac{\cos x}{x}dx,$$

called the "sine integral" and the "cosine integral," and denoted by "Si x" and "Ci x," also the integral

$$\int_0^x e^{-x^2}dx$$

called the "error-function integral," and denoted by "Erf x." All these functions have been tabulated (see TABLES, MATHEMATICAL).

Eulerian Integrals.

51. New functions can be introduced also by means of the definite integrals of functions of two or more variables with respect to one of the variables, the limits of integration being fixed. Prominent among such functions are the Beta and Gamma functions expressed by the equations

$$\mathrm{B}(l,m)=\int_0^1 x^{l-1}(1-x)^{m-1}dx,$$

$$\Gamma(n)=\int_0^\infty e^{-t}t^{n-1}dt.$$

When n is a positive integer $\Gamma(n+1)=n!$. The Beta function (or "Eulerian integral of the first kind") is expressible in terms of Gamma functions (or "Eulerian integrals of the second kind") by the formula

$$\mathrm{B}(l,m).\Gamma(l+m)=\Gamma(l).\Gamma(m).$$

The Gamma function satisfies the difference equation

$$\Gamma(x+1)=x\Gamma(x),$$

and also the equation

$$\Gamma(x).\Gamma(1-x)=\pi/\sin(x\pi),$$

with the particular result

$$\Gamma(\tfrac{1}{2})=\sqrt{\pi}.$$

The number

$$-\left[\frac{d}{dx}\{\log\Gamma(1+x)\}\right]_{x=0},\ \text{or}-\Gamma'(1),$$

is called "Euler's constant," and is equal to the limit

$$\lim_{n=\infty}\left[\left(1+\tfrac{1}{2}+\tfrac{1}{3}+\ldots+\tfrac{1}{n}\right)-\log n\right];$$

its value to 15 decimal places is 0·577 215 664 901 532. The function $\log\Gamma(1+x)$ can be expanded in the series

$$\log\Gamma(1+x)=\tfrac{1}{2}\log\left(\frac{x\pi}{\sin x\pi}\right)-\tfrac{1}{2}\log\frac{1+x}{1-x}+\{1+\Gamma'(1)\}x$$
$$-\tfrac{1}{3}(\mathrm{S}_3-1)x^3-\tfrac{1}{5}(\mathrm{S}_5-1)x^5-\ldots,$$

where

$$\mathrm{S}_{2r+1}=1+\frac{1}{2^{2r+1}}+\frac{1}{3^{2r+1}}+\ldots,$$

and the series for $\log\Gamma(1+x)$ converges when x lies between -1 and 1.

Definite Integrals.

52. Definite integrals can sometimes be evaluated when the limits of integration are some particular numbers, although the corresponding indefinite integrals cannot be found. For example, we have the result

$$\int_0^1(1-x^2)^{-\frac{1}{2}}\log x dx=-\tfrac{1}{2}\pi\log 2,$$

although the indefinite integral of $(1-x^2)^{-\frac{1}{2}}\log x$ cannot be found. Numbers of definite integrals are expressible in terms of the transcendental functions mentioned in § 50 or in terms of Gamma functions. For the calculation of definite integrals we have the following methods:—

(i.) Differentiation with respect to a parameter.
(ii.) Integration with respect to a parameter.
(iii.) Expansion in infinite series and integration term by term.
(iv.) Contour integration.

The first three methods involve an interchange of the order of two limiting operations, and they are valid only when the functions satisfy certain conditions of continuity, or, in case the limits of integration are infinite, when the functions tend to zero at infinite distances in a sufficiently high order (see FUNCTION). The method of contour integration involves the introduction of complex variables (see FUNCTION: § *Complex Variables*).

A few results are added

(i.) $\int_0^\infty \frac{x^{a-1}}{1+x}dx = \frac{\pi}{\sin a\pi}$, $(1>a>0)$,

(ii.) $\int_0^\infty \frac{x^{a-1}-x^{b-1}}{1-x}dx = \pi(\cot a\pi - \cot b\pi)$, $(0<a$ or $b<1)$,

(iii.) $\int_0^\infty \frac{x^{a-1}\log x}{x-1}dx = \frac{\pi^2}{\sin^2 a\pi}$, $(a>1)$,

(iv.) $\int_0^\infty x^2.\cos 2x.e^{-x^2}dx = -\frac{1}{4}e^{-1}\sqrt{\pi}$,

(v.) $\int_0^1 \frac{1-x^2}{1+x^4}\frac{dx}{\log x} = \log\tan\frac{\pi}{8}$,

(vi.) $\int_0^\infty \frac{\sin mx}{e^{2\pi x}-1}dx = \frac{1}{2}\left(\frac{1}{e^m-1}-\frac{1}{m}+\frac{1}{2}\right)$,

(vii.) $\int_0^\pi \log(1-2\alpha\cos x+\alpha^2)dx = 0$ or $2\pi\log\alpha$ according as $\alpha <$ or > 1,

(viii.) $\int_0^\infty \frac{\sin x}{x}dx = \frac{1}{2}\pi$,

(ix.) $\int_0^\infty \frac{\cos ax}{x^2+b^2}dx = \frac{1}{2}\pi b^{-1}e^{-ab}$,

(x.) $\int_0^\infty \frac{\cos ax - \cos bx}{x^2}dx = \frac{1}{2}\pi(b-a)$,

(xi.) $\int_0^\infty \frac{\cos ax - \cos bx}{x}dx = \log\frac{b}{a}$,

(xii.) $\int_0^\infty \frac{\cos x - e^{-mx}}{x}dx = \log m$,

(xiii.) $\int_{-\infty}^\infty e^{-x^2+2ax}dx = \sqrt{\pi}.e^{a^2}$,

(xiv.) $\int_0^\infty x^{-\frac{1}{2}}\sin x dx = \int_0^\infty x^{-\frac{1}{2}}\cos x dx = \sqrt{(\frac{1}{2}\pi)}$.

53. The meaning of integration of a function of n variables through a domain of the same number of dimensions is explained in the article FUNCTION. In the case of two variables x, y we integrate a function $f(x,y)$ over an area; in the case of three variables x, y, z we integrate a function $f(x, y, z)$ through a volume. The integral of a function $f(x, y)$ over an area in the plane of (x, y) is denoted by

Multiple Integrals.

$$\iint f(x, y)dxdy.$$

The notation refers to a method of evaluating the integral. We may suppose the area divided into a very large number of very small rectangles by lines parallel to the axes. Then we multiply the value of f at any point within a rectangle by the measure of the area of the rectangle, sum for all the rectangles, and pass to a limit by increasing the number of rectangles indefinitely and diminishing all their sides indefinitely. The process is usually effected by summing first for all the rectangles which lie in a strip between two lines parallel to one axis, say the axis of y, and afterwards for all the strips. This process is equivalent to integrating $f(x, y)$ with respect to y, keeping x constant, and taking certain functions of x as the limits of integration for y, and then integrating the result with respect to x between constant limits. The integral obtained in this way may be written in such a form as

$$\int_a^b dx\left\{\int_{f_1(x)}^{f_2(x)} f(x, y)dy\right\},$$

and is called a "repeated integral." The identification of a surface integral, such as $\iint f(x, y)dxdy$, with a repeated integral cannot always be made, but implies that the function satisfies certain conditions of continuity. In the same way volume integrals are usually evaluated by regarding them as repeated integrals, and a volume integral is written in the form

$$\iiint f(x, y, z)dxdydz.$$

Integrals such as surface and volume integrals are usually called "multiple integrals." Thus we have "double" integrals, "triple" integrals, and so on. In contradistinction to multiple integrals the ordinary integral of a function of one variable with respect to that variable is called a "simple integral."

A more general type of surface integral may be defined by taking an arbitrary surface, with or without an edge. We suppose in the first place that the surface is closed, or has no edge. We may mark a large number of points on the surface, and draw the tangent planes at all these points. These tangent planes form a polyhedron having a large number of faces, one to each marked point; and we may choose the marked points so that all the linear dimensions of any face are less than some arbitrarily chosen length. We may devise a rule for increasing the number of marked points indefinitely and decreasing the lengths of all the edges of the polyhedra indefinitely. If the sum of the areas of the faces tends to a limit, this limit is the area of the surface. If we multiply the value of a function f at a point of the surface by the measure of the area of the corresponding face of the polyhedron, sum for all the faces, and pass to a limit as before, the result is a surface integral, and is written

Surface Integrals.

$$\iint f dS.$$

The extension to the case of an open surface bounded by an edge presents no difficulty. A line integral taken along a curve is defined in a similar way, and is written

Line Integrals.

$$\int f ds$$

where ds is the element of arc of the curve (§ 33). The direction cosines of the tangent of a curve are dx/ds, dy/ds, dz/ds, and line integrals usually present themselves in the form

$$\int\left(u\frac{dx}{ds}+v\frac{dy}{ds}+w\frac{dz}{ds}\right)ds \text{ or } \int_s(udx+vdy+wdz).$$

In like manner surface integrals usually present themselves in the form

$$\iint(l\xi+m\eta+n\zeta)dS$$

where l, m, n are the direction cosines of the normal to the surface drawn in a specified sense.

The area of a bounded portion of the plane of (x, y) may be expressed either as

$$\tfrac{1}{2}\int(xdy-ydx),$$

or as

$$\iint dxdy,$$

the former integral being a line integral taken round the boundary of the portion, and the latter a surface integral taken over the area within this boundary. In forming the line integral the boundary is supposed to be described in the positive sense, so that the included area is on the left hand.

53*a*. We have two theorems of transformation connecting volume integrals with surface integrals and surface integrals with line integrals. The first theorem, called "Green's theorem," is expressed by the equation

Theorems of Green and Stokes.

$$\iiint\left(\frac{\partial\xi}{\partial x}+\frac{\partial\eta}{\partial y}+\frac{\partial\zeta}{\partial z}\right)dxdydz = \iint(l\xi+m\eta+n\zeta)dS,$$

where the volume integral on the left is taken through the volume within a closed surface S, and the surface integral on the right is taken over S, and l, m, n denote the direction cosines of the normal to S drawn outwards. There is a corresponding theorem for a closed curve in two dimensions, viz.,

$$\iint\left(\frac{\partial\xi}{\partial x}+\frac{\partial\eta}{\partial y}\right)dxdy = \int\left(\xi\frac{dy}{ds}-\eta\frac{dx}{ds}\right)ds,$$

the sense of description of s being the positive sense. This theorem is a particular case of a more general theorem called "Stokes's theorem." Let s denote the edge of an open surface S, and let S be covered with a network of curves so that the meshes of the network are nearly plane, then we can choose a sense of description of the edge of any mesh, and a corresponding sense for the normal to S at any point within the mesh, so that these senses are related like the directions of rotation and translation in a right-handed screw. This convention fixes the sense of the normal (l, m, n) at any point on S when the sense of description of s is chosen. If the axes of x, y, z are a right-handed system, we have Stokes's theorem in the form

$$\int_s(udx+vdy+wdz) = \iint\left\{l\left(\frac{\partial w}{\partial y}-\frac{\partial v}{\partial z}\right)+m\left(\frac{\partial u}{\partial z}-\frac{\partial w}{\partial x}\right)+n\left(\frac{\partial v}{\partial x}-\frac{\partial u}{\partial y}\right)\right\}dS,$$

where the integral on the left is taken round the curve s in the chosen sense. When the axes are left-handed, we may either reverse the sense of l, m, n and maintain the formula, or retain the sense of l, m, n and change the sign of the right-hand member of the equation. For the validity of the theorems of Green and Stokes it is in general necessary that the functions involved should satisfy certain conditions of continuity. For example, in Green's theorem the differential coefficients $\partial\xi/\partial x$, $\partial\eta/\partial y$, $\partial\zeta/\partial z$ must be continuous within S. Further, there are restrictions upon the nature of the curves or surfaces involved. For example, Green's theorem, as here stated, applies only to simply-connected regions of space. The correction for multiply-connected regions is important in several physical theories.

54. The process of changing the variables in a multiple integral, such as a surface or volume integral, is divisible into two stages. It is necessary in the first place to determine the differential element expressed by the product of the differentials of the first set of variables in terms of the differentials of the second set of variables. It is necessary in the second place to determine the limits of integration which must be employed when the integral in terms of the new variables is evaluated as a repeated integral. The first part of the problem is solved at once by the introduction of the Jacobian. If the variables of one set are denoted by $x_1, x_2, \ldots, x_n$, and those of the other set by $u_1, u_2, \ldots, u_n$, we have the relation

Change of Variables in a Multiple Integral.

$$dx_1dx_2\ldots dx_n = \frac{\partial(x_1, x_2, \ldots, x_n)}{\partial(u_1, u_2, \ldots, u_n)}du_1du_2\ldots du_n.$$

In regard to the second stage of the process the limits of integration must be determined by the rule that the integration with respect to the second set of variables is to be taken through the same domain as the integration with respect to the first set.

For example, when we have to integrate a function $f(x, y)$ over the area within a circle given by $x^2+y^2=a^2$, and we introduce polar coordinates so that $x=r\cos\theta$, $y=r\sin\theta$, we find that r is the value of the Jacobian, and that all points within or on the circle are given by $a\geqq r\geqq 0$, $2\pi>\theta\geqq 0$, and we have

$$\int_{-a}^{a}dx\int_{-\sqrt{(a^2-x^2)}}^{\sqrt{(a^2-x^2)}}f(x, y)dy=\int_0^a dr\int_0^{2\pi}f(r\cos\theta, r\sin\theta)rd\theta.$$

If we have to integrate over the area of a rectangle $a\geqq x\geqq 0$, $b\geqq y\geqq 0$, and we transform to polar coordinates, the integral becomes the sum of two integrals, as follows:—

$$\int_0^a dx\int_0^b f(x,y)dy=\int_0^{\tan^{-1}b/a}d\theta\int_0^{a\sec\theta}f(r\cos\theta, r\sin\theta)rdr$$
$$+\int_{\tan^{-1}b/a}^{\frac{1}{2}\pi}d\theta\int_0^{b\,\mathrm{cosec}\,\theta}f(r\cos\theta, r\sin\theta)rdr.$$

55. A few additional results in relation to line integrals and multiple integrals are set down here.

Line Integrals and Multiple Integrals.

(i.) Any simple integral can be regarded as a line-integral taken along a portion of the axis of x. When a change of variables is made, the limits of integration with respect to the new variable must be such that the domain of integration is the same as before. This condition may require the replacing of the original integral by the sum of two or more simple integrals.

(ii.) The line integral of a perfect differential of a one-valued function, taken along any closed curve, is zero.

(iii.) The area within any plane closed curve can be expressed by either of the formulae

$$\int\tfrac{1}{2}r^2d\theta \text{ or } \int\tfrac{1}{2}pds,$$

where r, θ are polar coordinates, and p is the perpendicular drawn from a fixed point to the tangent. The integrals are to be understood as line integrals taken along the curve. When the same integrals are taken between limits which correspond to two points of the curve, in the sense of line integrals along the arc between the points, they represent the area bounded by the arc and the terminal radii vectores.

(iv.) The volume enclosed by a surface which is generated by the revolution of a curve about the axis of x is expressed by the formula

$$\pi\int y^2dx,$$

and the area of the surface is expressed by the formula

$$2\pi\int yds,$$

where ds is the differential element of arc of the curve. When the former integral is taken between assigned limits it represents the volume contained between the surface and two planes which cut the axis of x at right angles. The latter integral is to be understood as a line integral taken along the curve, and it represents the area of the portion of the curved surface which is contained between two planes at right angles to the axis of x.

(v.) When we use curvilinear coordinates ξ, η which are conjugate functions of x, y, that is to say are such that

$$\partial\xi/\partial x=\partial\eta/\partial y \text{ and } \partial\xi/\partial y=-\partial\eta/\partial x,$$

the Jacobian $\partial(\xi, \eta)/\partial(x, y)$ can be expressed in the form

$$\left(\frac{\partial\xi}{\partial x}\right)^2+\left(\frac{\partial\eta}{\partial x}\right)^2,$$

and in a number of equivalent forms. The area of any portion of the plane is represented by the double integral

$$\iint J^{-1}d\xi d\eta,$$

where J denotes the above Jacobian, and the integration is taken through a suitable domain. When the boundary consists of portions of curves for which $\xi=$const., or $\eta=$const., the above is generally the simplest way of evaluating it.

(vi.) The problem of "rectifying" a plane curve, or finding its length, is solved by evaluating the integral

$$\int\left\{1+\left(\frac{dy}{dx}\right)^2\right\}^{\frac{1}{2}}dx,$$

or, in polar coordinates, by evaluating the integral

$$\int\left\{r^2+\left(\frac{dr}{d\theta}\right)^2\right\}^{\frac{1}{2}}d\theta.$$

In both cases the integrals are line integrals taken along the curve.

(vii.) When we use curvilinear coordinates ξ, η as in (v.) above, the length of any portion of a curve $\xi=$const. is given by the integral

$$\int J^{-\frac{1}{2}}d\eta$$

taken between appropriate limits for η. There is a similar formula for the arc of a curve $\eta=$const.

(viii.) The area of a surface $z=f(x, y)$ can be expressed by the formula

$$\iint\left\{1+\left(\frac{\partial z}{\partial x}\right)^2+\left(\frac{\partial z}{\partial y}\right)^2\right\}^{\frac{1}{2}}dxdy.$$

When the coordinates of the points of a surface are expressed as functions of two parameters u, v, the area is expressed by the formula

$$\iint\left[\left\{\frac{\partial(y, z)}{\partial(u, v)}\right\}^2+\left\{\frac{\partial(z, x)}{\partial(u, v)}\right\}^2+\left\{\frac{\partial(x, y)}{\partial(u, v)}\right\}^2\right]^{\frac{1}{2}}dudv.$$

When the surface is referred to three-dimensional polar coordinates r, θ, ϕ given by the equations

$$x=r\sin\theta\cos\phi,\ y=r\sin\theta\sin\phi,\ z=r\cos\theta,$$

and the equation of the surface is of the form $r=f(\theta,\phi)$, the area is expressed by the formula

$$\iint r\left[\left\{r^2+\left(\frac{\partial r}{\partial\theta}\right)^2\right\}\sin^2\theta+\left(\frac{\partial r}{\partial\phi}\right)^2\right]^{\frac{1}{2}}d\theta d\phi.$$

The surface integral of a function of (θ, ϕ) over the surface of a sphere $r=$const. can be expressed in the form

$$\int_0^{2\pi}d\phi\int_0^{\pi}F(\theta, \phi)r^2\sin\theta d\theta.$$

In every case the domain of integration must be chosen so as to include the whole surface.

(ix.) In three-dimensional polar coordinates the Jacobian

$$\frac{\partial(x, y, z)}{\partial(r, \theta, \phi)}=r^2\sin\theta.$$

The volume integral of a function F (r, θ, ϕ) through the volume of a sphere $r=a$ is

$$\int_0^a dr\int_0^{2\pi}d\phi\int_0^{\pi}F(r, \theta, \phi)r^2\sin\theta d\theta.$$

(x.) Integrations of rational functions through the volume of an ellipsoid $x^2/a^2+y^2/b^2+z^2/c^2=1$ are often effected by means of a general theorem due to Lejeune Dirichlet (1839), which is as follows: when the domain of integration is that given by the inequality

$$\left(\frac{x_1}{a_1}\right)^{\alpha_1}+\left(\frac{x_2}{a_2}\right)^{\alpha_2}+\ldots+\left(\frac{x_n}{a_n}\right)^{\alpha_n}\leqq 1,$$

where the a's and α's are positive, the value of the integral

$$\iint\ldots x_1^{n_1-1}.\ x_2^{n_2-1}\ldots dx_1dx_2\ldots$$

is

$$\frac{a_1^{n_1}a_2^{n_2}\ldots}{\alpha_1\alpha_2\ldots}\cdot\frac{\Gamma\left(\frac{n_1}{\alpha_1}\right)\Gamma\left(\frac{n_2}{\alpha_2}\right)\ldots}{\Gamma\left(1+\frac{n_1}{\alpha_1}+\frac{n_2}{\alpha_2}+\ldots\right)}.$$

If, however, the object aimed at is an integration through the volume of an ellipsoid it is simpler to reduce the domain of integration to that within a sphere of radius unity by the transformation $x=a\xi$, $y=b\eta$, $z=c\zeta$, and then to perform the integration through the sphere by transforming to polar coordinates as in (ix).

Approximate and Mechanical Integration.

56. Methods of approximate integration began to be devised very early. Kepler's practical measurement of the focal sectors of ellipses (1609) was an approximate integration, as also was the method for the quadrature of the hyperbola given by James Gregory in the appendix to his *Exercitationes geometricae* (1668). In Newton's *Methodus differentialis* (1711) the subject was taken up systematically. Newton's object was to effect the approximate quadrature of a given curve by making a curve of the type

$$y=a_0+a_1x+a_2x^2+\ldots+a_nx^n$$

pass through the vertices of $(n+1)$ equidistant ordinates of the given curve, and by taking the area of the new curve so determined as an approximation to the area of the given curve. In 1743 Thomas Simpson in his *Mathematical Dissertations* published a very convenient rule, obtained by taking the vertices of three consecutive equidistant ordinates to be points on the same parabola. The distance between the extreme ordinates corresponding to the abscissae $x=a$ and $x=b$ is divided into $2n$ equal segments by ordinates $y_1, y_2, \ldots y_{2n-1}$, and the extreme ordinates are denoted by y_0, y_{2n}. The vertices of the ordinates y_0, y_1, y_2 lie on a parabola with its axis parallel to the axis of y, so do the vertices of the ordinates y_2, y_3, y_4, and so on. The area is expressed approximately by the formula

$$\{(b-a)/6n\}[y_0+y_{2n}+2(y_2+y_4+\ldots+y_{2n-2})+4(y_1+y_3+\ldots+y_{2n-1})],$$

which is known as Simpson's rule. Since all simple integrals can be represented as areas such rules are applicable to approximate integration in general. For the recent developments reference may be made to the article by A. Voss in *Ency. d. Math. Wiss.*, Bd. II., A. 2 (1899), and to a monograph by B. P. Moors, *Valeur approximative d'une intégrale définie* (Paris, 1905).

Many instruments have been devised for registering mechanically the areas of closed curves and the values of integrals. The best known are perhaps the "planimeter" of J. Amsler (1854) and the "integraph" of Abdank-Abakanowicz (1882).

Bibliography.—For historical questions relating to the subject th chief authority is M. Cantor, *Geschichte d. Mathematik* (3 Bde., Leipzig, 1894–1901). For particular matters, or special periods, the following may be mentioned: H. G. Zeuthen, *Geschichte d. Math. im Altertum u. Mittelalter* (Copenhagen, 1896) and *Gesch. d. Math. im XVI. u. XVII. Jahrhundert* (Leipzig, 1903); S. Horsley, *Isaaci Newtoni opera quae exstant omnia* (5 vols., London, 1779–1785); C. I. Gerhardt, *Leibnizens math. Schriften* (7 Bde., Leipzig, 1849–1863); Joh. Bernoulli, *Opera omnia* (4 Bde., Lausanne and Geneva, 1742). Other writings of importance in the history of the subject

are cited in the course of the article. A list of some of the more important treatises on the differential and integral calculus is appended. The list has no pretensions to completeness; in particular, most of the recent books in which the subject is presented in an elementary way for beginners or engineers are omitted.—L. Euler, *Institutiones calculi differentialis* (Petrop., 1755) and *Institutiones calculi integralis* (3 Bde., Petrop., 1768–1770); J. L. Lagrange, *Leçons sur le calcul des fonctions* (Paris, 1806, *Œuvres*, t. x.), and *Théorie des fonctions analytiques* (Paris, 1797, 2nd ed., 1813, *Œuvres*, t. ix.); S. F. Lacroix, *Traité de calcul diff. et de calcul int.* (3 tt., Paris, 1808–1819). There have been numerous later editions; a translation by Herschel, Peacock and Babbage of an abbreviated edition of Lacroix's treatise was published at Cambridge in 1816. G. Peacock, *Examples of the Differential and Integral Calculus* (Cambridge, 1820); A. L. Cauchy, *Résumé des leçans . . . sur le calcul infinitésimale* (Paris, 1823), and *Leçons sur le calcul différentiel* (Paris, 1829; *Œuvres*, sér. 2, t. iv.); F. Minding, *Handbuch d. Diff.-u. Int.-Rechnung* (Berlin, 1836); F. Moigno, *Leçons sur le calcul diff.* (4 tt., Paris, 1840–1861); A. de Morgan, *Diff. and Int. Calc.* (London, 1842); D. Gregory, *Examples on the Diff. and Int. Calc.* (2 vols., Cambridge, 1841–1846); I. Todhunter, *Treatise on the Diff. Calc.* and *Treatise on the Int. Calc.* (London, 1852), numerous later editions; B. Price, *Treatise on the Infinitesimal Calculus* (2 vols., Oxford, 1854), numerous later editions; D. Bierens de Haan, *Tables d'intégrales définies* (Amsterdam, 1858); M. Stegemann, *Grundriss d. Diff.- u. Int.-Rechnung* (2 Bde., Hanover, 1862) numerous later editions; J. Bertrand, *Traité de calc. diff. et int.* (2 tt., Paris, 1864–1870); J. A. Serret, *Cours de calc. diff. et int.* (2 tt., Paris, 1868, 2nd ed., 1880, German edition by Harnack, Leipzig, 1884–1886, later German editions by Bohlmann, 1896, and Scheffers, 1906, incomplete); B. Williamson, *Treatise on the Diff. Calc.* (Dublin, 1872), and *Treatise on the Int. Calc.* (Dublin, 1874) numerous later editions of both; also the article "Infinitesimal Calculus" in the 9th ed. of the *Ency. Brit.*; C. Hermite, *Cours d'analyse* (Paris, 1873); O. Schlömilch, *Compendium d. häheren Analysis* (2 Bde., Leipzig, 1874) numerous later editions; J. Thomae, *Einleitung in d. Thearie d. bestimmten Integrale* (Halle, 1875); R. Lipschitz, *Lehrbuch d. Analysis* (2 Bde., Bonn, 1877, 1880); A. Harnack, *Elemente d. Diff.-u. Int.-Rechnung* (Leipzig, 1882, Eng. trans. by Cathcart, London, 1891); M. Pasch, *Einleitung in d. Diff.-u. Int.-Rechnung* (Leipzig, 1882); Genocchi and Peano, *Calcalo differenziale* (Turin, 1884, German edition by Bohlmann and Schepp, Leipzig, 1898, 1899); H. Laurent, *Traité d'analyse* (7 tt., Paris, 1885–1891); J. Edwards, *Elementary Treatise on the Diff. Calc.* (London, 1886), several later editions; A. G. Greenhill, *Diff. and Int. Calc.* (London, 1886, 2nd ed., 1891); É. Picard, *Traité d'analyse* (3 tt., Paris, 1891–1896); O. Stolz, *Grundzüge d. Diff.- u. Int.-Rechnung* (3 Bde., Leipzig, 1893–1899); C. Jordan, *Cours d'analyse* (3 tt., Paris, 1893–1896); L. Kronecker, *Vorlesungen ü. d. Theorie d. einfachen u. vielfachen Integrale* (Leipzig, 1894); J. Perry, *The Calculus for Engineers* (London, 1897); H. Lamb, *An Elementary Course of Infinitesimal Calculus* (Cambridge, 1897); G. A. Gibson, *An Elementary Treatise an the Calculus* (London, 1901); É. Goursat, *Cours d'analyse mathématique* (2 tt., Paris, 1902–1905); C.-J. de la Vallée Poussin, *Cours d'analyse infinitésimale* (2 tt., Louvain and Paris, 1903–1906); A. E. H. Love, *Elements of the Diff. and Int. Calc.* (Cambridge, 1909); W. H. Young, *The Fundamental Theorems af the Diff. Calc.* (Cambridge, 1910). A résumé of the infinitesimal calculus is given in the articles "Diff.-u. Int-Rechnung" by A. Voss, and "Bestimmte Integrale" by G. Brunel in *Ency. d. math. Wiss.* (Bde. ii. A. 2, and ii. A. 3, Leipzig, 1899, 1900). Many questions of principle are discussed exhaustively by E. W. Hobson, *The Theory of Functions af a Real Variable* (Cambridge, 1907). (A. E. H. L.)

INFINITIVE, a form of the verb, properly a noun with verbal functions, but usually taken as a mood (see GRAMMAR). The Latin grammarians gave it the name of *infinitus* or *infinitivus modus*, *i.e.* indefinite, unlimited mood, as not having definite persons or numbers.

INFLEXION (from Lat. *inflectere*, to bend), the action of bending inwards, or turning towards oneself, or the condition of being bent or curved. In optics, the term "inflexion" was used by Newton for what is now known as "diffraction of light" (*q.v.*). For inflexion in geometry see CURVE. Inflexion when used of the voice, in speaking or singing, indicates a change in tone, pitch or expression. In grammar (*q.v.*) inflexion indicates the changes which a word undergoes to bring it into correct relations with the other words with which it is used. In English grammar nouns, pronouns, adjectives (in their degrees of comparison), verbs and adverbs are inflected. Some grammarians, however, regard the inflexions of adverbs more as an actual change in word-formation.

INFLUENCE (Late Lat. *influentia*, from *influere*, to flow in), a word whose principal modern meaning is that of power, control or action affecting others, exercised either covertly or without visible means or direct physical agency. It is one of those numerous terms of astrology (*q.v.*) which have established themselves in current language. From the stars was supposed to flow an ethereal stream which affected the course of events on the earth and the fortunes and characters of men. For the law as to "undue influence" see CONTRACT.

INFLUENZA (syn. "grip," *la grippe*), a term applied to an infectious febrile disorder due to a specific bacillus, characterized specially by catarrh of the respiratory passages and alimentary canal, and occurring mostly as an epidemic. The Italians in the 17th century ascribed it to the influence of the stars, and hence the name "influenza." The French name *grippe* came into use in 1743, and those of *petite poste* and *petit courier* in 1762, while *général* became another synonym in 1780. Apparently the scourge was common; in 1403 and 1557 the sittings of the Paris law courts had to be suspended through it, and in 1427 sermons had to be abandoned through the coughing and sneezing; in 1510 masses could not be sung. Epidemics occurred in 1580, 1676, 1703, 1732 and 1737, and their cessation was supposed to be connected with earthquakes and volcanic eruptions.

The disease is referred to in the works of the ancient physicians, and accurate descriptions of it have been given by medical writers during the last three centuries. These various accounts agree substantially in their narration of the phenomena and course of the disease, and influenza has in all times been regarded as fulfilling all the conditions of an epidemic in its sudden invasion, and rapid and extensive spread. Among the chief epidemics were those of 1762, 1782, 1787, 1803, 1833, 1837 and 1847. It appeared in fleets at sea away from all communication with land, and to such an extent as to disable them temporarily for service. This happened in 1782 in the case of the squadron of Admiral Richard Kempenfelt (1718–1782), which had to return to England from the coast of France in consequence of influenza attacking his crews.

Like cholera and plague, influenza reappeared in the last quarter of the 19th century, after an interval of many years, in epidemic or rather pandemic form. After the year 1848, in which 7963 deaths were directly attributed to influenza in England and Wales, the disease continued prevalent until 1860, with distinct but minor epidemic exacerbations in 1851, 1855 and 1858; during the next decade the mortality dropped rapidly though not steadily, and the diminution continued down to the year 1889, in which only 55 deaths were ascribed to this cause. It is not clear whether the disease ever disappears wholly, and the deaths registered in 1889 are the lowest recorded in any year since the registrar-general's returns began. Occasionally local outbreaks of illness resembling epidemic influenza have been observed during the period of abeyance, as in Norfolk in 1878 and in Yorkshire in 1887; but whether such outbreaks and the so-called "sporadic" cases are nosologically identical with epidemic influenza is open to doubt. The relation seems rather to be similar to that between Asiatic cholera and "cholera nostras." Individual cases may be indistinguishable, but as a factor in the public health the difference between sporadic and epidemic influenza is as great and unmistakable as that between the two forms of cholera. This fact, which had been forgotten by some since 1847 and never learnt by others, was brought home forcibly to all by the visitation of 1889.

According to the exhaustive report drawn up by Dr H. Franklin Parsons for the Local Government Board, the earliest appearances were observed in May 1889, and three localities are mentioned as affected at the same time, all widely separated from each other—namely, Bokhara in Central Asia, Athabasca in the north-west Territories of Canada and Greenland. About the middle of October it was reported at Tomsk in Siberia, and by the end of the month at St Petersburg. During November Russia became generally affected, and cases were noticed in Paris, Berlin, Vienna, London and Jamaica (?). In December epidemic influenza became established over the whole of Europe, along the Mediterranean, in Egypt and over a large area in the United States. It appeared in several towns in England, beginning with Portsmouth, but did not become generally epidemic until the commencement of the new year. In London the full onset of unmistakable influenza dated from the 1st of January 1890. Everywhere it seems to have exhibited the same explosive character when once fully established. In St Petersburg, out of a government staff of 260 men, 220 were taken ill in one night, the 15th of November. During January 1890 the epidemic reached its height in London, and appeared in a large number of towns throughout the British Islands, though it was less prevalent in the north and north-west than in the south. January witnessed a great extension of the disease in Germany, Holland, Switzerland, Austria-Hungary, Italy, Spain and Portugal; but in Russia, Scandinavia and France it was already declining. The period of greatest activity in Europe was the latter half of December and the earlier half of January, with the change of the year for a central point. Other parts of the world affected in January 1890 were Cape Town, Canada, the United States generally, Algiers, Tunis, Cairo, Corsica, Sardinia, Sicily, Honolulu, Mexico, the West Indies and Montevideo. In February the provincial towns of England were most severely affected, the death-rate rising to 27·4, but in London it fell from 28·1 to 21·2, and for Europe generally the back of the epidemic was broken. At the same time, however, it appeared in Ceylon, Penang, Japan, Hong Kong and India; also in West Africa, attacking Sierra Leone, and Gambia in the middle of the month; and finally in the west, where Newfoundland and Buenos Aires were invaded. In March influenza became widely epidemic in India, particularly in Bengal and Bombay, and made its appearance in Australia and New Zealand. In April and May it was epidemic all over Australasia, in Central America, Brazil, Peru, Arabia and Burma. During the summer and autumn it reached a number of isolated islands, such as Iceland, St Helena, Mauritius and Réunion. Towards the close of the year it was reported from Yunnan in the interior of China, from the Shiré Highlands in Central Africa, Shoa in Abyssinia, and Gilgit in Kashmir. In the course of fifteen months, beginning with its undoubted appearance in Siberia in October 1889, it had traversed the entire globe.

The localities attacked by influenza in 1889–1890 appear in no case to have suffered severely for more than a month or six weeks. Thus in Europe and North America generally the visitation had come to an end in the first quarter of 1890. The earliest signs of an epidemic revival on a large scale occurred in March 1891, in the United States and the north of England. It was reported from Chicago and other large towns in the central states, whence it spread eastwards, reaching New York about the end of March. In England it began in the Yorkshire towns, particularly in Hull, and also independently in South Wales. In London influenza became epidemic for the second time about the end of April, and soon afterwards was widely distributed in England and Wales. The large towns in the north, together with London and Wales, suffered much more heavily in mortality than in the previous attack, but the south-west of England, Scotland and Ireland escaped with comparatively little sickness. The same may be said of the European continent generally, except parts of Russia, Scandinavia and perhaps the north of Germany. This second epidemic coincided with the spring and early summer; it had subsided in London by the end of June. The experience of Sheffield is interesting. In 1890 the attack, contrary to general experience, had been undecided, lingering and mild; in 1891 it was very sudden and extremely severe, the death-rate rising to 73·4 during the month of April, and subsiding with equal rapidity. During the third quarter of the year, while Europe was free, the antipodes had their second attack, which was more severe than the first. As in England, it reversed the previous order of things, beginning in the provinces and spreading thence to the capital towns. The last quarter of the year was signalized by another recrudescence in Europe, which reached its height during the winter. All parts, including Great Britain, were severely affected. In England those parts which had borne the brunt of the epidemic in the early part of the year escaped. In fact, these two revivals may be regarded as one, temporarily interrupted by the summer quarter.

The recrudescence at the end of 1891 lasted through mid-winter, and in many places, notably in London, it only reached its height in January 1892, subsiding slowly and irregularly in February and March. Brighton suffered with exceptional severity. The continent of Europe seems to have been similarly affected. In Italy the notifications of influenza were as follow: 1891—January to October, 0; November, 30; December, 6461; 1892—January, 84,543; February, 55,352; March, 28,046; April, 7962; May, 1468; June, 223. Other parts of the world affected were the West Indies, Tunis, Egypt, Sudan, Cape Town, Teheran, Tongking and China. In August 1892 influenza was reported from Peru, and later in the year from various places in Europe.

A fourth recrudescence, but of a milder character, occurred in Great Britain in the spring of 1893, and a fifth in the following winter, but the year 1894 was freer from influenza than any since 1890. In 1895 another extensive epidemic took place. In 1896 influenza seemed to have spent its strength, but there was an increased prevalence of the disease in 1897, which was repeated on a larger scale in 1898, and again in 1899, when 12,417 deaths were recorded in England and Wales. This was the highest death-rate since 1892. After this the death-rate declined to half that amount and remained there with the slight upward variations until 1907, in which the total death-rate was 9257. The experience of other countries has been very similar; they have all been subjected to periodical revivals of epidemic influenza at irregular intervals and of varying intensity since its reappearance in 1889, but there has been a general though not a steady decline in its activity and potency. Its behaviour is, in short, quite in keeping with the experience of 1847–1860, though the later visitation appears to have been more violent and more fatal than the former. Its diffusion was also more rapid and probably more extensive.

The foregoing general summary may be supplemented by some further details of the incidence in Great Britain. The number of deaths directly attributed to influenza, and the death-rates per million in each year in England and Wales, are as follow:—

Year.	Deaths.	Death-rates per million.	Year.	Deaths.	Death-rates per million.
1890	4,523	157	1899	12,417	389
1891	16,686	574	1900	16,245	504
1892	15,737	534	1901	5,666	174
1893	9,669	325	1902	7,366	223
1894	6,625	220	1903	6,322	189
1895	12,880	424	1904	5,694	168
1896	3,753	122	1905	6,953	204
1897	6,088	196	1906	6,310	183
1898	10,405	331	1907	9,257	265

It is interesting to compare these figures with the corresponding ones for the previous visitation:—

Year.	Deaths.	Death-rates per million.	Year.	Deaths.	Death-rates per million.
1847	4,881	285	1852	1,359	76
1848	7,963	460	1853	1,789	99
1849	1,611	92	1854	1,061	58
1850	1,380	78	1855	3,568	193
1851	2,152	120			

The two sets of figures are not strictly comparable, because, during the first period, notification of the cause of death was not compulsory; but it seems clear that the later wave was much the more deadly. The average annual death-rate for the nine years is 320 in the one case against 162 in the other, or as nearly as possible double. In both epidemic periods the second year was far more fatal than the first, and in both a marked revival took place in the ninth year; in both also an intermediate recrudescence occurred, in the fifth year in one case, in the sixth in the other. The chief point of difference is the sudden and marked drop in 1849–1850, against a persistent high mortality in 1892–1893, especially in 1892, which was nearly as fatal as 1891.

To make the significance of these epidemic figures clear, it should be added that in the intervening period 1861–1889 the average annual death-rate from influenza was only fifteen, and in the ten years immediately preceding the 1890 outbreak it was only three. Moreover, in epidemic influenza, the mortality directly attributed to that disease is only a fraction of that actually caused by it. For instance, in January 1890 the deaths from influenza in London were 304, while the excess of deaths from respiratory diseases was 1454 and from all causes 1958 above the average.

We have seen above that the mortality was far greater in the second epidemic year than in the first, and this applies to all parts of England, and to rural as well as to urban communities, as the following table shows:—

Deaths from Influenza.

	1890.	1891.
London	624	2302
24 Great Towns over 80,000 population	439	2417
35 Towns between 20,000 and 80,000	186	765
21 Towns between 10,000 and 20,000	46	196
60 Towns under 10,000	62	196
85 Rural Sanitary Districts	317	841

In spite of these figures, it appears that the 1890 attack, which was in general much more sudden in its onset than that of 1891, also caused a great deal more sickness. More people were "down with influenza," though fewer died. For instance, the number of persons treated at the Middlesex Hospital in the two months' winter epidemic of 1890 was 1279; in the far more fatal three months' spring epidemic of 1891 it was only 726. One explanation of this discrepancy between the incidence of sickness and mortality is that in the second attack, which was more protracted and more insidious, the stress of the disease fell more upon the lungs. Another is that its comparative mildness, combined with the time of year, in itself proved dangerous, because it tempted people to disregard the illness, whereas in the first epidemic they were too ill to resist. On the whole, rural districts showed a higher death-rate than towns, and small towns a higher one than large ones in both years. This is explained by the age distribution in such localities; influenza being particularly fatal to aged people, though no age is exempt. Certain counties were much more severely affected than others. The eastern counties, namely, Essex, Suffolk and Norfolk, together with Hampshire and one or two others, escaped lightly in both years; the western counties, namely, North and South Wales, with the adjoining counties of Monmouth, Hereford and Shropshire, suffered heavily in both years.

It will be convenient to discuss *seriatim* the various points of interest on which light has been thrown by the experience described above.

The bacteriology of influenza is discussed in the article on Parasitic Diseases. The disease is often called "Russian" influenza, and its origin in 1889 suggests that the name may have some foundation in fact. A writer, who saw the epidemic break out in Bokhara, is quoted by him to the following effect:— "The summer of 1888 was exceptionally hot and dry, and was followed by a bitterly cold winter and a rainy spring. The dried-up earth was full of cracks and holes from drought and subsequent frost, so that the spring rains formed ponds in these holes, inundated the new railway cuttings, and turned the country into a perfect marsh. When the hot weather set in the water gave off poisonous exhalations, rendering malaria general." On account of the severe winter, the people were enfeebled from lack of nourishment, and when influenza broke out suddenly they died in large numbers. Europeans were very severely affected. Russians, hurrying home, carried the disease westwards, and caravans passing eastwards took it into Siberia. There is a striking similarity in the conditions described to those observed in connexion with outbreaks of other diseases, particularly typhoid fever and diphtheria, which have occurred on the supervention of heavy rain after a dry period, causing cracks and fissures in the earth. Assuming the existence of a living poison in the ground, we can easily understand that under certain conditions, such as an exceptionally dry season, it may develop exceptional properties and then be driven out by the subsequent rains, causing a violent outbreak of illness. Some such explanation is required to account for the periodical occurrence of epidemic and pandemic diffusions starting from an endemic centre. We may suppose that a micro-organism of peculiar robustness and virulence is bred and brought into activity by a combination of favourable conditions, and is then disseminated more or less widely according to its "staying power," by human agency. Whether central Asia is an endemic centre for influenza or not there is no evidence, but the disease seems to be more often prevalent in the Russian Empire than elsewhere. Extensive outbreaks occurred there in 1886 and 1887, and it is certain that the 1889 wave was active in Siberia at an earlier date than in Europe, and that it moved eastwards. The hypothesis that it originated in China is unsupported by evidence. But whatever may be the truth with regard to origin, the dissemination of influenza by human agency must be held to be proved. This is the most important addition to our knowledge of the subject contributed by recent research. The upshot of the inquiry by Dr Parsons was to negative all theories of atmospheric influence, and to establish the conclusion that the disease was "propagated mainly, perhaps entirely, by human intercourse."

He found that it prevailed independently of climate, season and weather; that it moved in a contrary direction to the prevailing winds; that it travelled along the lines of human intercourse, and not faster than human beings can travel; that in 1889 it travelled much faster than in previous epidemics, when the means of locomotion were very inferior; that it appeared first in capital towns, seaports and frontier towns, and only affected country districts later; that it never commenced suddenly with a large number of cases in a place previously free from disease, but that epidemic manifestations were generally preceded for some days or weeks by scattered cases; that conveyance of infection by individuals and its introduction into fresh places had been observed in many instances; that persons brought much into contact with others were generally the first to suffer; that persons brought together in large numbers in enclosed spaces suffered more in proportion than others, and that the rapidity and extent of the outbreak in institutions corresponded with the massing together of the inmates.

These conclusions, based upon the 1889–1890 epidemic, have been confirmed by subsequent experience, especially in regard to the complete independence of season and weather shown by influenza. It has appeared and disappeared at all seasons and in all weathers and only popular ignorance continues to ascribe its behaviour to atmospheric conditions. In Europe, however, it has prevailed more often in winter than in summer, which may be due to the greater susceptibility of persons in winter, or, more probably, to the fact that they congregate more in buildings and are less in the open air during that part of the year. No doubt is any longer entertained of its infectious character, though the degree of infectivity appears to vary considerably. Many cases have been recorded of individuals introducing it into houses, and of all or most of the other inmates then taking it from the first case. Difficulties in preventing the spread of infection are due to (1) the shortness of the period of incubation, (2) the disease being infectious in the earliest stages before the nature of the illness is recognized, (3) the milder varieties being equally infectious with the severe attacks, and the patient going to work and spreading the infection, (4) the diagnosis often being difficult, influenza being possibly confused with ordinary catarrhal attacks, typhoid fever and other diseases. Domestic animals seem to be free from any suspicion of being liable to human influenza. Sanitary conditions, other than overcrowding, do not appear to exercise any influence on the spread of influenza.

Influenza has been shown to be an acute specific fever having nothing whatever to do with a "bad cold." There may be some inflammation of the respiratory passages, and then symptoms of catarrh are present, but that is not necessarily the case, and in some epidemics such symptoms are quite exceptional. This had been recognized by various writers before the 1889 visitation, but it had not been generally realized, as it has been since, and some medical authorities, who persisted in regarding influenza as essentially a "catarrhal" affection, were chiefly to blame for a widespread and tenacious popular fallacy.

Leichtenstern, in his masterly article in Nothnagel's *Handbuch*, divides the disease as follows:—(1) Epidemic influenza vera caused by Pfeiffer's bacillus; (2) Endemic-epidemic influenza vera, which occurs several years after a pandemic and is caused by the same bacillus; (3) Endemic influenza nostras or catarrhal fever, called *la grippe*, and bearing the same relation to true influenza as cholera nostras does to Asiatic cholera.

The "period of incubation" is one to four days. Susceptibility varies greatly, but the conditions that influence it are matters of conjecture only. It appears that the inhabitants of Great Britain are less susceptible than those of many other countries. Dr Parsons gives the following list, showing the proportion of the population estimated to have been attacked in the 1889–1890 epidemic in different localities:—

Place.	Per cent.	Place.	Per cent.
St Petersburg	50	Portugal	90
Berlin	33	Vienna	30-40
Nuremberg	67	Belgrade	33
Grand-Duchy of Hesse	25-30	Antwerp	33
Grand-Duchy, other Districts	50-75	Gaeta	50-77
		Massachusetts	39
Heligoland	50	Peking	50
Budapest	50	St Louis (Mauritius)	67

In and about London he reckoned roughly from a number of returns that the proportion was about 12½ % among those employed out of doors and 25% among those in offices, &c. The proportion among the troops in the Home District was 9·3%. The General Post Office made the highest return with 33·6%, which is accounted for partly by the enormous number of persons massed together in the same room in more than one department, and partly by the facilities for obtaining medical advice, which would tend to bring very light cases, unnoticed elsewhere, upon the record. No public service was seriously disorganized in England by sickness in the same manner as on the continent of Europe. Some individuals appear to be totally immune; others take the disease over and over again, deriving no immunity, but apparently greater susceptibility from previous attacks.

The symptoms were thus described by Dr Bruce Low from observations made in St Thomas's Hospital, London, in January 1890:—

The invasion is sudden; the patients can generally tell the time when they developed the disease; *e.g.* acute pains in the back and loins came on quite suddenly while they were at work or walking in the street, or in the case of a medical student, while playing cards, rendering him unable to continue the game. A workman wheeling a barrow had to put it down and leave it; and an omnibus driver was unable to pull up his horses. This sudden onset is often accompanied by vertigo and nausea, and sometimes actual vomiting of bilious matter. There are pains in the limbs and general sense of aching all over; frontal headache of special severity; pains in the eyeballs, increased by the slightest movement of the eyes; shivering; general feeling of misery and weakness, and great depression of spirits, many patients, both men and women, giving way to weeping; nervous restlessness; inability to sleep, and occasionally delirium. In some cases catarrhal symptoms develop, such as running at the eyes, which are sometimes injected on the second day; sneezing and sore throat; and epistaxis, swelling of the parotid and submaxillary glands, tonsilitis, and spitting of bright blood from the pharynx may occur. There is a hard, dry cough of a paroxysmal kind, worst at night. There is often tenderness of the spleen, which is almost always found enlarged, and this persists after the acute symptoms have passed. The temperature is high at the onset of the disease. In the first twenty-four hours its range is from 100° F. in mild cases to 105° in severe cases.

Dr J. S. Bristowe gave the following description of the illness during the same epidemic:—

The chief symptoms of influenza are, coldness along the back, with shivering, which may continue off and on for two or three days; severe pain in the head and eyes, often with tenderness in the eyes and pain in moving them; pains in the ears; pains in the small of the back; pains in the limbs, for the most part in the fleshy portions, but also in the bones and joints, and even in the fingers and toes; and febrile temperature, which may in the early period rise to 104° or 105° F. At the same time the patient feels excessively ill and prostrate, is apt to suffer from nausea or sickness and diarrhoea, and is for the most part restless, though often (and especially in the case of children and those advanced in age) drowsy. . . . In ordinary mild cases the above symptoms are the only important ones which present themselves, and the patient may recover in the course of three or four days. He may even have it so mildly that, although feeling very ill, he is able to go about his ordinary work. In some cases the patients have additionally some dryness or soreness of the throat, or some stiffness and discharge from the nose, which may be accompanied by slight bleeding. And in some cases, for the most part in the course of a few days, and at a time when the patient seems to be convalescent, he begins to suffer from wheezing in the chest, cough, and perhaps a little shortness of breath, and before long spits mucus in which are contained pellets streaked or tinged with blood. . . . Another complication is diarrhoea. Another is a roseolous spotty rash. . . . Influenza is by no means necessarily attended with the catarrhal symptoms which the general public have been taught to regard as its distinctive signs, and in a very large proportion of cases no catarrhal condition whatever becomes developed at any time.

Several writers have distinguished four main varieties of the disease—namely, (1) nervous, (2)gastro-intestinal, (3)respiratory, (4) febrile, a form chiefly found in children. Clifford Allbutt says, "Influenza simulates other diseases." Many forms are of typhoid or comatose types. Cardiac attacks are common, not from organic disease but from the direct poisoning of the heart muscle by influenza.

Perhaps the most marked feature of influenza, and certainly the one which victims have learned to dread most, is the prolonged debility and nervous depression that frequently follow an attack. It was remarked by Nothnagel that "Influenza produces a specific nervous toxin which by its action on the cortex produces psychoses." In the Paris epidemic of 1890 the suicides increased 25%, a large proportion of the excess being attributed to nervous prostration caused by the disease. Dr Rawes, medical superintendent of St Luke's hospital, says that of insanities traceable to influenza melancholia is twice as frequent as all other forms of insanity put together. Other common after-effects are neuralgia, dyspepsia, insomnia, weakness or loss of the special senses, particularly taste and smell, abdominal pains, sore throat, rheumatism and muscular weakness. The feature most dangerous to life is the special liability of patients to inflammation of the lungs. This affection must be regarded as a complication rather than an integral part of the illness. The following diagram gives the annual death-rate per million in England and Wales, and is taken from an article by Dr Arthur Newsholme in *The Practitioner* (January 1907).

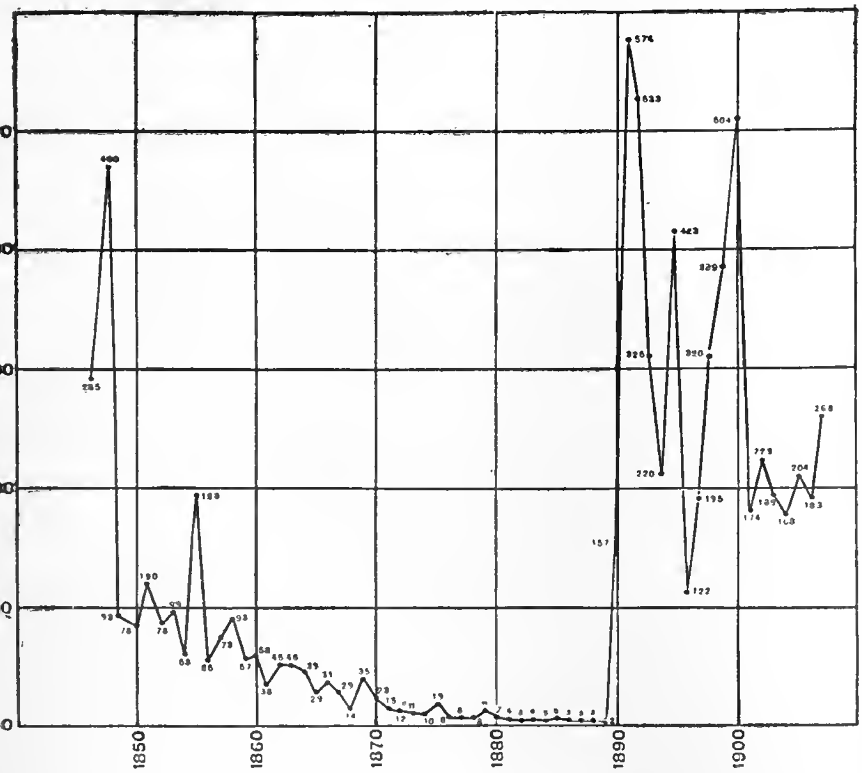
The deaths directly attributed to influenza are few in proportion to the number of cases. In the milder forms it offers hardly any danger to life if reasonable care be taken, but in the severer forms it is a fairly fatal disease. In eight London hospitals the case-mortality among in-patients in the 1890 outbreak was 34·5 per 1000; among all patients treated it was 1·6 per 1000. In the army it was rather less.

The infectious character of influenza having been determined, suggestions were made for its administrative control on the familiar lines of notification, isolation and disinfection, but this has not hitherto been found practicable. In March 1895, however, the Local Government Board issued a memorandum recommending the adoption of the following precautions wherever they can be carried out:—

1. The sick should be separated from the healthy. This is especially important in the case of first attacks in a locality or a household.
2. The sputa of the sick should, especially in the acute stage of the disease, be received into vessels containing disinfectants. Infected articles and rooms should be cleansed and disinfected.
3. When influenza threatens, unnecessary assemblages of persons should be avoided.
4. Buildings and rooms in which many people necessarily congregate should be efficiently aerated and cleansed during the intervals of occupation.

There is no routine treatment for influenza except bed. In all cases bed is advisable, because of the danger of lung complications, and in mild ones it is sufficient. Severer ones must be treated according to the symptoms. Quinine has been much used. Modern "anti-pyretic" drugs have also been extensively employed, and when applied with discretion they may be useful, but patients are not advised to prescribe them for themselves.

Sir Wm. Broadbent in a note on the prophylaxis of influenza recommends quinine in a dose of two grains every morning, and remarks: "I have had opportunities of obtaining extraordinary evidence of its protective power. In a large public school it was ordered to be taken every morning. Some of the boys in the school were home boarders, and it was found that while the boarders at the school took the quinine in the presence of a master every morning, there were scarcely any cases of influenza among them, although the home boarders suffered nearly as much as before." He continues, "In a large girls' school near London the same thing was ordered, and the girls and mistresses took their morning dose but the servants were forgotten. The result was that scarcely any girl or mistress suffered while the servants were all down with influenza."



The liability to contract influenza, and the danger of an attack if contracted, are increased by depressing conditions, such as exposure to cold and to fatigue, whether mental or physical. Attention should, therefore, be paid to all measures tending to the maintenance of health. Persons who are attacked by influenza should at once seek rest, warmth and medical treatment, and they should bear in mind that the risk of relapse, with serious complications, constitutes a chief danger of the disease.

In addition to the ordinary text-books, see the series of articles by experts on different aspects in *The Practitioner* (London) for January 1907.

IN FORMÂ PAUPERIS (Latin, "in the character of pauper"), the legal phrase for a method of bringing or defending a case in court on the part of persons without means. By an English statute of 1495 (11 Hen. VII. c. 12), any poor person having cause of action was entitled to have a writ according to the nature of the case, without paying the fees thereon. The statute of 1495 was repealed by the Statute Law Revision and Civil Procedure Act 1883, but its provisions, as well as the chancery practice were incorporated into one code and embodied in the rules of the Supreme Court (O. xvi. rr. 22-31). Now any person may be admitted to sue as a pauper, on proof that he is not worth £25, his wearing apparel and the subject matter of the cause or matter excepted. He must lay his case before counsel for opinion, and counsel's opinion thereon, with an affidavit of the party suing that the case contains a full and true statement of all the material facts to the best of his knowledge and belief, must be produced before the proper officers to whom the application is made. A person who desires to defend as a pauper must enter an appearance to a writ in the ordinary way and afterwards apply for an order to defend as a pauper. Where a person is admitted to sue or defend as a pauper, counsel and solicitor may be assigned to him, and such counsel and solicitor are not at liberty to refuse assistance unless there is some good reason for refusing. If any person admitted to sue or defend as a pauper agrees to pay fees to any person for the conduct of his business he will be dispaupered. Costs ordered to be paid to a pauper are taxed as in other cases. Appeals to the House of Lords *in formâ pauperis* were regulated by the Appeal (Formâ Pauperis) Act 1893, which gave the House of Lords power to refuse a petition for leave to sue.

INFORMATION (from Lat. *informare*, to give shape or form to, to represent, describe), the communication of knowledge; in English law, a proceeding on behalf of the crown against a subject otherwise than by indictment. A criminal information is a proceeding in the King's bench by the attorney-general without the intervention of a grand jury. The attorney-general, or, in his absence, the solicitor-general, has a right *ex officio* to file a criminal information in respect of any indictments, but not for treason, felonies or misprision of treason. It is, however, seldom exercised, except in cases which might be described as "enormous misdemeanours," such as those peculiarly tending to disturb or endanger the king's government, *e.g.* seditions, obstructing the king's officers in the execution of their duties, &c. In the form of the proceedings the attorney-general is said to "come into the court of our lord the king before the king himself at Westminster, and gives the court there to understand and be informed that, &c." Then follows the statement of the offence as in an indictment. The information is filed in the crown office without the leave of the court. An information may also be filed at the instance of a private prosecutor for misdemeanours not affecting the government, but being peculiarly flagrant and pernicious. Thus criminal informations have been granted for bribing or attempting to bribe public functionaries, and for aggravated libels on public or private persons. Leave to file an information is obtained after an application to show cause, founded on a sworn statement of the material facts of the case.

Certain suits might also be filed in Chancery by way of information in the name of the attorney-general, but this species of information was superseded by Order 1, rule 1 of the Rules of the Supreme Court, 1883, under which they are instituted in the ordinary way. Informations in the Court of Exchequer in revenue cases, also filed by the attorney-general, are still resorted to (see *A.-G.* v. *Williamson*, 1889, 60 L.T. 930).

INFORMER, in a general sense, one who communicates information. The term is applied to a person who prosecutes in any of the courts of law those who break any law or penal statute. Such a person is called a common informer when he furnishes evidence on criminal trials or prosecutes for breaches of penal laws solely for the purpose of obtaining the penalty recovered, or a share of it. An action by a common informer is termed a *popular* or *qui tam* action, because it is brought by a person *qui tam pro domino rege quam pro se ipso sequitur*. A suit by an informer must be brought within a year of the offence, unless a specific time is prescribed by the statute. The term informer is also used of an accomplice in crime who turns what is called "king's evidence" (see ACCOMPLICE). In Scotland, informer is the term applied to the party who, in criminal proceedings, sets the lord advocate in motion.

INFUSORIA, the name given by Bütschli (following O.F. Ledermüller, 1763) to a group of Protozoa. The name arose from the procedure adopted by the older microscopists to obtain animalcules. Infusions of most varied organic substances were prepared (hay and pepper being perhaps the favourite ones), the method of obtaining them including maceration and decoction, as well as infusion in the strict sense; they were then allowed to decompose in the air, so that various living beings developed therein. As classified by C. G. Ehrenberg in his monumental *Infusionstierchen als vollkommene Organismen*, they included (1) Desmids, Diatoms and Schizomycetes, now regarded as essentially Plant Protista or Protophytes; (2) Sarcodina (excluding Foraminifera, as well as Radiolaria, which were only as yet known by their skeletons, and termed Polycystina), and (3) Rotifers, as well as (4) Flagellates and Infusoria in our present sense. F. Dujardin in his *Histoire des zoophytes* (1841) gave nearly as liberal an interpretation to the name; while C. T. Van Siebold (1845) narrowed it to its present limits save for the admission of several Flagellate families. O. Bütschli limited the group by removing the Flagellata, Dinoflagellata and Cystoflagellata (*q.v.*) under the name of "Mastigophora" proposed earlier by R. M. Diesing (1865). We now define it thus:—Protozoa bounded by a permanent plasmic pellicle and consequently of definite form, never using pseudopodia for locomotion or ingestion, provided (at least in the young state) with numerous cilia or organs derived from cilia and equipped with a double nuclear apparatus: the larger (mega-) nucleus usually dividing by constriction, and disappearing during conjugation: the smaller (micro-) nucleus (sometimes multiple) dividing by mitosis, and entering into conjugation and giving rise to the cycle of nuclei both large and small of the race succeeding conjugation.

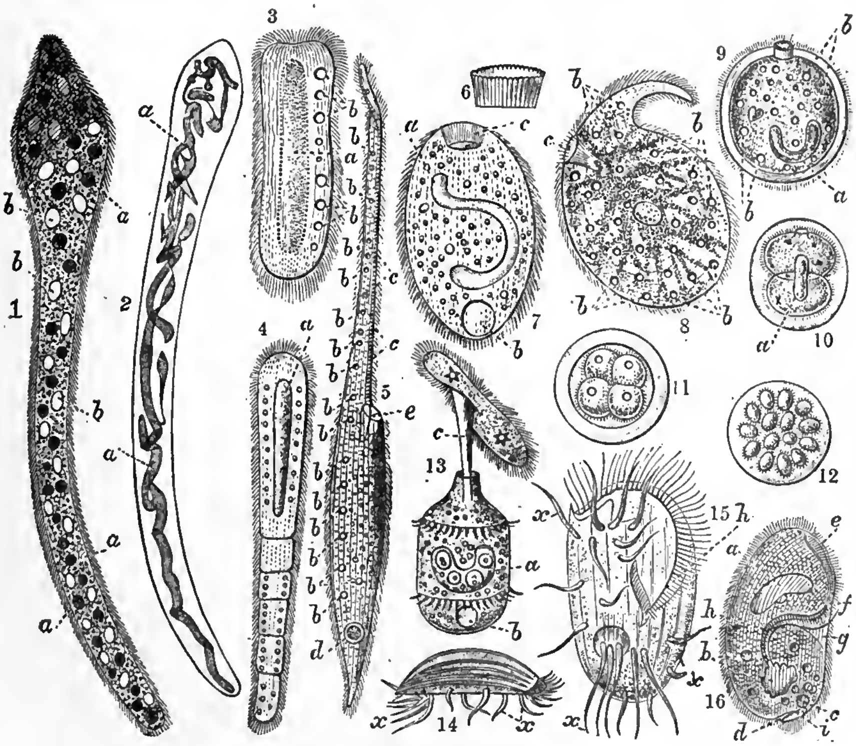


FIG. i. Ciliata.

1. *Opalinopsis sepiolae*, Foett.; a parasitic holotrichous mouthless Ciliate from the liver of the Squid. *a*, branched meganucleus; *b*, vacuoles (non-contractile).
2. A similar specimen treated with picro-carmine, showing a remarkably branched and twisted meganucleus (*a*), in place of several nuclei.
3. *Anoplophrya naidos*, Duj.; a mouthless Holotrichous Ciliate parasitic in the worm *Nais*; × 200. *a*, the large axial meganucleus; *b*, contractile vacuoles.
4. *Anoplophrya prolifera*, C. and L.; from the intestine of *Clitellio*. Remarkable for the adhesion of incomplete fission-products in a metameric series. *a*, meganucleus.
5. *Amphileptus gigas*, C. and L.; (Gymnostomaceae) × 100. *b*, contractile vacuoles; *c*, trichocysts (see fig. 2); *d*, meganucleus; *e*, pharynx.
6, 7. *Prorodon niveus*, Ehr.; (Gymnostomaceae); × 75. *a*, meganucleus; *b*, contractile vacuole; *c*, pharynx with horny cuticular lining.
6. The fasciculate cuticle of the pharynx isolated.
8. *Trachelius ovum*, Ehr. (Gymnostomaceae); ×80; showing the reticulate arrangement of the endosarc, *b*, contractile vacuoles; *c*, the cuticle-lined pharynx.
9, 10, 11, 12. *Icthyophthirius multifilius*, Fouquet (Gymnostomaceae) ×120. Free individual and successive stages of division to form spores. *a*, meganucleus; *b*, contractile vacuoles.
13. *Didinium nasutum*, Müll.; (Gymnostomaceae); ×200. The pharynx is everted and has seized a *Paramecium* as food. *a*, meganucleus; *b*, contractile vacuole; *c*, everted pharynx.
14. *Euplotes charon*, Müll., (Hypotrichaceae); lateral view of the animal when using its great cirrhi, *x*, as ambulatory organs.
15. *Euplotes harpa*, Stein (Hypotrichaceae); ×150. *h*, mouth; *x*, cirrhi.
16. *Nyctotherus cordiformis*, Stein (a Heterotriceae), parasitic in the intestine of the Frog); *a*, meganucleus; *b*, contractile vacuole; *c*, food particle; *d*, anus; *e*, heterotrichous band of membranelles; *f*, *g*, mouth; *h*, pharynx; *i*, small cilia.

Thus defined, the Infusoria fall into two groups:—(1) *Ciliata*, with cilia or organs derived from cilia throughout their lives, provided with a single permanent mouth (absent in the parasitic *Opalinopsidae*) flush with the body or at the base of an oral depression, and taking in food by active swallowing or by ciliary action: (2) *Suctoria*, rarely ciliated except in the young state, and taking in their food by suction through protrusible hollow tentacles, usually numerous.

The pellicle of the Infusoria is stronger and more permanent than in many Protozoa, and sometimes assumes the character of a mail of hard plates, closely fitting; but even in this case it undergoes solution soon after death. It is continuous with a firm ectosarc, highly differentiated in the Ciliata, and in both groups free from coarse movable granules. The endosarc is semifluid and rich in granules mostly "reserve" in nature, often showing proteid or fat reactions. One or more contractile vacuoles are present in some of the marine and all the freshwater species, and open to the surface by pores of permanent position: a system of canals in the deeper layers of the ectoplasm is sometimes connected with the vacuole. The body is often provided with not-living external formations "stalk" and "theca" (or "lorica").

The character of the nuclear apparatus excludes two groups both parasitic and mouthless: (1) the Trichonymphidae, with a single nucleus of Leidy, parasitic in Insects, especially Termites; (2) the Opalinidae, with several (often numerous) uniform nuclei, parasitic in the gut of Batrachia, &c., and producing 1-nuclear zoospores which conjugate. Both these families we unite into a group of Pseudociliata, which may be referred to the *Flagellata* (*q.v.*). Lankester in the last edition of this Encyclopaedia called attention to the doubtful position of *Opalina*, and Delage and Hérouard placed Trichonymphidae among Flagellates.

The theca or shell is present in some pelagic species (fig. iii. 3, 5) and in many of the attached species, notably among the Peritricha (fig. iii. 21, 22, 25, 26) and Suctoria (fig. viii. 11); and is found in some free-swimming forms (fig. iii. 3, 5): it is usually chitinous, and forms a cup into which the animal, protruded when at its utmost elongation, can retract itself. In *Metacineta mystacina* it has several distinct slits (pylomes) for the passage of tufts of tentacles. In *Stentor* it is gelatinous; and in the Dictyocystids it is beautifully latticed.

The stalk is usually solid, and expanded at the base into a disk in Suctoria. In Peritrichaceae (fig. iii. 8-22, 25, 26), the only ciliate group with a stalk, it grows for some time after its formation, and on fission two new stalks continue the old one, so as to form a branched colony (fig. iii. 18). In *Vorticella* (fig. iii. 11, 12, 14, &c.) the stalk is hollow and elastic, and attached to it along a spiral is a prolongation of the ectosarc containing a bundle of myonemes, so that by the contractions of the bundle the stalk is pulled down into a corkscrew spiral, and on the relaxation of the muscle the elasticity of the hollow stalk straightens it out.

On fission the stalk may become branched, as the solid one of *Epistylis* and *Opercularia* (fig. iii. 20); and the myoneme also in the tubular stem of *Zoothaminum*; or the branch-myoneme for the one offspring may be inserted laterally on that for the other in *Carchesium* (fig. iii. 18). In several tubicolous Peritrichaceae there is some arrangement for closing their tubes. In *Thuricola* (fig. iii. 25-26) there is a valve which opens by the pressure of the animal on its protrusion, and closes automatically by elasticity on retraction. In *Lagenophrys* the animal adheres to the cup a little below the opening, so that its withdrawal closes the cup: at the adherent part the body mass is hardened, and so differentiated as to suggest the frame of the mouth of a purse. In *Pyxicola* (fig. iii. 21-22) the animal bears some way down the body a hardened shield (" operculum ") which closes the mouth of the shell on retraction.

The cytoplasm of the Infusoria is very susceptible to injuries; and when cut or torn, unless the pellicle contracts rapidly to enclose the wounded surface, the substance of the body swells up, becoming frothy, with bubbles which rapidly enlarge and finally burst; the cell thus disintegrates, leaving only a few granules to mark where it was. This phenomenon, observed by Dujardin, is called " diffluence." The contractile vacuole appears to be one of the means by which diffluence is avoided in cells with no strong wall to resist the

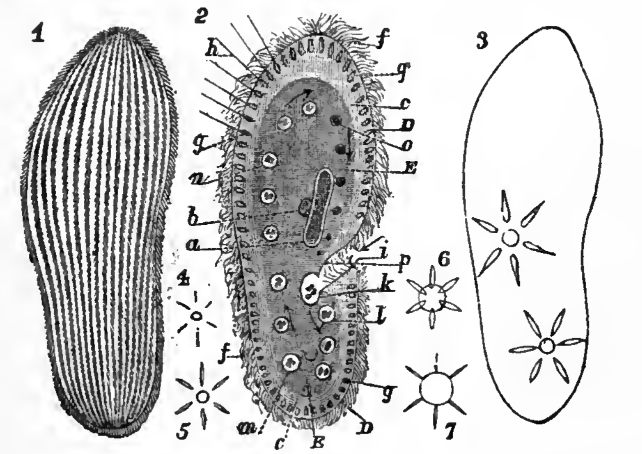

Fig. ii.

2, *a*, mega-; *b*, micro-nucleus; *c*, junction of ecto- and endosarc; *D*, pellicle; *E*, endosarc; *f*, cilia (much too numerous and crowded); *g*, trichocysts; *g′*, same with thread; *h*, discharged; *i*, pharynx, its undulating membrane not shown; *k*, food granules collecting into a bolus; *l*, *m*, *n*, *o*, food vacuoles, their contents being digested as they pass in the endosarc along the path indicated by the arrows.

3, Outline showing contractile vacuoles in commencing diastole, surrounded by five afferent canals.

4-7 Successive stages of diastole of contractile vacuole.

absorption of water in excess: for after growing in size for some time, its walls contract suddenly, and its contents are expelled to the outside by a pore, which is, like the anus, usually invisible, but permanent in position. The contractile vacuole may be single or multiple; it may receive the contents of a canal, or of a system of canals, which only become visible at the moment of the contraction of the vacuole (fig. ii. 4-7), giving liquid time to accumulate in them, or when the vacuole is acting sluggishly or imperfectly, as in the approach of asphyxia (fig. ii. 3). Besides this function, since the system passes a large quantity of water from without through the substance of the cell, it must needs act as a means of respiration and excretion. In all Peritrichaceae it opens to the vestibule, and in some of them it discharges through an intervening reservoir, curiously recalling the arrangements in the Flagellate Euglenaceae.

The nuclear apparatus consists of two parts, the meganucleus, and the micronucleus or micronuclei (fig. iii. 17 *d*, iv. 1). The meganucleus alone regarded and described as " the nucleus " by older observers is always single, subject to a few reservations. It is most frequently oval, and then is indented by the micronucleus; but it may be lobed, the lobes lying far apart and connected by a slender bridge or moniliform, or horseshoe-shaped (Peritrichaceae). It often contains darker inclusions, like nucleoles.

It has been shown, more especially by Gruber, that many Ciliata are multinucleate, and do not possess merely a single meganucleus and a micronucleus. In *Oxytricha* the nuclei are large and numerous (about forty), scattered through the protoplasm, whilst in other cases the nucleus is so finely divided as to appear like a powder diffused uniformly through the medullary protoplasm (*Trachelocerca*). Carmine staining, after treatment with absolute alcohol, has led to this remarkable discovery. The condition described by Foettinger in his *Opalinopsis* (fig. i. 1, 2) is an example of this pulverization of the nucleus. The condition of pulverization had led in some cases to a total failure to detect any nucleus in the living animal, and it was only by the use of reagents that the actual state of the case was revealed. Before fission, whatever be its habitual character, it condenses, becomes oval, and divides by constriction; and though it usually is then fibrillated, only in a few cases does it approach the typical mitotic condition. The micronucleus described by older writers as the " nucleolus " or " paranucleus " (" endoplastule " of Huxley), may be single or multiple. When the meganucleus is bilobed there are always two micronuclei, and at least one is found next to every enlargement of the moniliform meganucleus. In the fission of the Infusoria, every micronucleus divides by a true mitotic process, during which, however, its wall remains intact. From their relative sizes the meganucleus would appear to discharge during cell-life, exclusively, the functions of the nucleus in ordinary cells. Since in conjugation, however, the meganucleus degenerates and is in great part either digested or excreted as waste matter, while the new nuclear apparatus in both exconjugates arises, as we shall see, from a conjugation-nucleus of exclusively micronuclear origin, we infer that the micronucleus has for its function the carrying on of the nuclear functions of the race from one fission cycle to the next from which the meganucleus is excluded.

Fission is the ordinary mode of reproduction in the Infusoria, and is usually transverse, but oblique in *Stentor*, &c., as in Flagellata, longitudinal in Peritrichaceae; in some cases it is always more or less unequal owing to the differentiation of the body, and consequently it must be followed by a regeneration of the missing organs in either daughter-cell. In some cases it becomes very uneven, affording every transition to budding, which process assumes especial importance in the Suctoria. Multiple fission (brood-formation or sporulation) is exceptional in Infusoria, and when it occurs the broods rarely exceed four or eight—another difference from Flagellata. The nuclear processes during conjugation suggest the phylogenetic loss of a process of multiple fission into active gametes. As noted, in fission the meganucleus divides by direct constriction; each micronucleus by a mode of mitosis. The process of fission is subject in its activity to the influences of nutrition and temperature, slackening as the food supply becomes inadequate or as the temperature recedes from the optimum for the process. Moreover, if the descendants of a single animal be raised, it is found that the rapidity of fission, other conditions being the same, varies periodically, undergoing periods of depression, which may be followed by either (1) spontaneous recovery, (2) recovery under stimulating food, (3) recovery through conjugation, or (4) the death of the cycle, which would have ensued if 2 or 3 had been omitted at an earlier stage, but which ultimately seems inevitable, even the induction of conjugation failing to restore it. These physiological conditions were first studied by E. Maupas, librarian to the city of Algiers, in his pioneering work in the later 'eighties, and have been confirmed and extended by later observers, among whom we may especially cite G. N. Calkins.

Syngamy, usually termed conjugation or " karyogamy," is of exceptional character in the majority of this group—the Peritrichaceae alone evincing an approximation to the usual typical process of the permanent fusion of two cells (pairing-cells or gametes), cytoplasm to cytoplasm, nucleus to nucleus, to form a new cell (coupled cell, zygote).

This process was elucidated by E. Maupas in 1889, and his results, eagerly questioned and repeatedly tested, have been confirmed in every fact and in every generalization of importance.

Previously all that had been definitely made out was that under certain undetermined conditions a fit of pairing two and two occurred among the animals of the same species in a culture or in a locality in the open; that after a union prolonged over hours, and sometimes even days, the mates separated; that during the union the meganucleus underwent changes of a degenerative character; and that the micronucleus underwent repeated divisions, and that from the offspring of the micronuclei the new nuclear apparatus was evolved for each mate. Maupas discovered the biological conditions leading to conjugation: (1) the presence of individuals belonging to distinct stocks; (2) their belonging to a generation sufficiently removed from previous conjugation, but not too far removed therefrom; (3) a deficiency of food. He also showed that during conjugation a " migratory " nucleus, the offspring of the divisions of the micronucleus, passes from either mate to the other, while its sister nucleus remains " stationary "; and that reciprocal fusion of the migratory nucleus of the one mate with the stationary nucleus of the other takes place to form a zygote nucleus in either mate; and that from these zygote nuclei in each by division, at least two nuclei are formed, the one of which enlarges to form a meganucleus, while the other remains small as the first micronucleus of the new reorganized animal, which now separates as an " exconjugate " (fig. iv). Moreover, if pairing be prevented, or be not induced, the individuals produced by successive fissions become gradually weaker, their nuclear apparatus degenerates, and finally they cannot be induced

20, *Opercularia stenostoma*, St.; (×200); a small colony showing upstanding ("opercular") peristomial disk, protruded oral undulating membrane and cilia in oral tube.
21, 22, *Pyxicola affinis*, S.K., with stalk and theca; *x*, chitinous disk, or true "operculum" closing theca in retracted state.
23, 24, *Caenomorpha medusula*, Perty, (×250), with spiral peristomial wreath.
25, 26, *Thuricola valvata*, Str. Wright, in sessile theca, with internal valve (*v*) to close tube, as in gastropod *Clausilia*; owing to recent fission two animals occupy one tube.

under suitable conditions to pair normally, so that the cycle becomes extinct by senile decay. In Peritrichaceae the gametes are of unequal sizes (fig. iii. 11, 12), the smaller being formed by brood fissions (4 or 8); syngamy is here permanent, not temporary, the smaller (male) being absorbed into the body of the larger (female); and there are only two nuclei that pair. Thus we have a derived binary sexual process, comparable to that of ordinary bisexual organisms.

2, 3, First mitotic division of micronuclei.
4, 5, Second ditto.
6, One of the four nuclei resulting from the second division again dividing to form the pairing-nuclei in either mate, while the other 3 nuclei degenerate.
7, Migration of the migratory nuclei.
8, 9, Fusion of the incoming migratory with the stationary nucleus in either mate.
10, Fission of Zygote nucleus into two, the new mega- and micronucleus whose differentiation is shown in 11, 12. The vertical dotted line indicates the separation of the mates.

CILIATA.—The *Ciliate* Infusoria represent the highest type of Protozoa. They are distinctly animal in function, and the Gymnostomaceae are active predaceous beings preying on other Infusoria or Flagellates. Some possess shells (fig. iii. 3, 5, 21, 22, 25, 26), most have a distinct swallowing apparatus, and in *Dysteria* there is a complex jaw—or tooth-apparatus, which needs new investigation. In the active Ciliata we find locomotive organs of most varied kinds: tail-springs, cirrhi for crawling and darting, cilia and membranellae for continuous swimming in the open or gliding over surfaces or waltzing on the substratum (*Trichodina*, fig. iii. 8) or for eddying in wild turns through the water (*Strombidium*, *Tintinnus*, *Halteria*). Their forms offer a most interesting variety, and the flexibility of many adds to their easy grace of movement, especially where the front of the body is produced and elongated like the neck of a swan (*Amphileplus*, fig. iii. 5; *Lacrymaria*).

The cytoplasm is very highly differentiated: especially the ectoplasm or ectosarc. This has always a distinct elastic "pellicle" or limiting layer, in a few cases hard, or even with local hardenings that affect the disposition of a coat of mail (*Coleps*) or a pair of valves (*Dysteria*); but is usually only marked into a rhomboidal network by intersecting depressions, with the cilia occupying the centres of the areas or meshes defined. The cytoplasm within is distinctly alveolated, and frequently contains tubular alveoli running along the length of the animal. Between these are dense fibrous thickenings, which from their double refraction, from their arrangement, and from their shortening in contracted animals are regarded as of muscular function and termed "myonemes." Other threads running alongside of these, and not shortening but becoming wavy in the general contraction have been described in a few species as "neuronemes" and as possessing a *nervous*, conducting character. On this level, too, lie the dot-like granules at the bases of the cilia, which form definite groups in the case of such organs as are composed of fused cilia; in the deeper part of the ectoplasm the vacuoles or alveoli are more numerous, and reserve granules are also found; here too exist the canals, sometimes developed into a complex net-work, which open into the contractile vacuole.

FIG. v.—Diagram 1 illustrating changes during conjugation of *Colpidium colpoda*. (From Hickson, after Maupas.)

M, Old meganucleus undergoing disintegration.
m, Micronucleus.
N, migratory, and
S, Stationary pairing-nucleus.
M′, M′, the new meganuclei, and
m′, The new micronuclei in the products of the first fission of each of the ex-conjugates; the continuous vertical line indicates period of fusion, its cessation, separation; dotted lines indicate fission; the spaces lettered 1-7 successive stages in the process; the clear circles indicate functionless nuclei which degenerate.

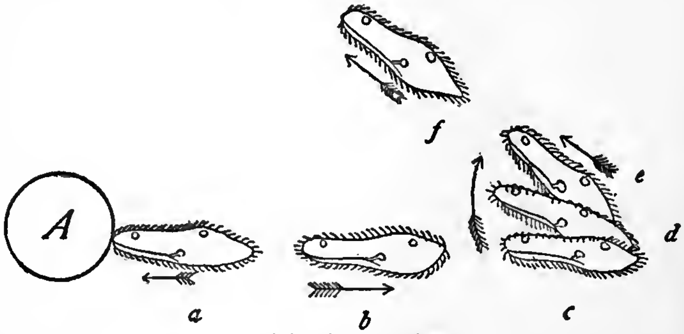
The cilia themselves have a stiffer basal part, probably strengthened by an axial rod, and a distal flexible lash; when cilia are united by the outer plasmatic layer, they form (1) "Cirrhi," stiff and either hook-like and pointed at the end, or brush-like, with a frayed apex; (2) membranelles, flattened organs composed of a number of cilia fused side by side, sometimes on a single row, sometimes on two rows approximated at either end so as to form a narrow oval, the membranelle thus being hollow; (3) the oral "undulating membrane," merely a very elongated membranelle whose base may extend over a length nearly equal to the length of the animal; such membranes are present in the mouth oral depression and pharynx of all but Gymnostomaceae, and aid in ingestion; a second or third may be present, and behave like active lips; (4) in Peritrichaceae the cilia of the peristomial wreath are united below into a continuous undulating membrane, forming a spiral of more than one turn, and fray out distally into a fringe; (5) the dorsal cilia of Hypotrichaceae are slender and motionless, probably sensory.

Embedded in the ectosarc of many Ciliates are trichocysts, little elongated sacs at right angles to the surface, with a fine hair-like process projecting. On irritation these elongate into strong prominent threads, often with a more or less barb-like head, and may be ejected altogether from the body. Those over the surface of the body appear to be protective; but in the Gymnostomaceae specially strong ones surround the mouth. They can be injected into the prey pursued, and appear to have a distinctly poisonous effect on it. They are combined also into defensive batteries in the Gymnostome *Loxophyllum*. They are absent from most Heterotrichaceae and Hypotrichaceae, and from Peritrichaceae, except for a zone round the collar of the peristome.

The openings of the body are the *mouth*, absent in a few parasital species (*Opalinopsis*, fig. i. 1, 2), the *anus* and the *pore* of the contractile vacuole. The *mouth* is easily recognizable; in the most primitive forms of the Gymnostomaceae and some other groups, it is terminal, but it passes further and further back in more modified species, thereby defining a ventral, and correspondingly a dorsal surface; it usually lies on the left side. The anus is usually only visible during excretion, though its position is permanent; in a few genera it is always visible (*e.g. Nyctotherus*, fig. i. 16). The pore of the contractile vacuole might be described in the same terms.

The endoplasm has also an alveolar structure, and contains besides large food-vacuoles or digestive vacuoles, and shows movements of rotation within the ectoplasm, from which, however, it is not usually distinctly bounded. In *Ophryoscolex* and *Didinium* (fig. i. 13) a permanent cavity traverses it from mouth to anus.

Ingestion of food is of the same character in all the Hymenostomata. The ciliary current drives a powerful stream into the mouth, which impinges against the endosarc, carrying with it the food particles; these adhere and accumulate to form a pellet, which ultimately is pushed by an apparently sudden action into the substance of the endosarc which closes behind it (fig. ii. 2). In some of the Aspirotrichaceae accessory undulating membranes play the part of lips, and there is a closer approximation to true deglutition. The mouth is rarely terminal, more frequently at the bottom of a depression, the "vestibule," which may be prolonged into a slender canal, sometimes called the "pharynx" or "oral tube," ciliated as well as provided with a membrane, and extending deep down into the body in many Peritrichaceae.



From Calkins' *Protozoa*, by permission of the Macmillan Company, N.Y.

FIG. vi.—Diagrammatic view of behaviour of the motile reaction of Paramecium after meeting a mechanical obstruction at A. (From G. N. Calkins after H. S. Jennings.) For clearness and simplicity the normal motion is supposed to be straight instead of spiral.

In Spirostomaceae the "adoral wreath" of membranelles encloses more or less completely an anterior part of the body, the "peristome," within which lies the vestibule. This area may be depressed, truncate, convex or produced into a short obconical disk or into one or more lobes, or finally form a funnel, or a twisted spiral like a paper cone. In most Peritrichaceae a collar-like rim surrounds the peristome, and marks out a gutter from which the vestibule opens; the peristome can be retracted, and the collar close over it. This rim forms a deep permanent spiral funnel in *Spirochona* (fig. iii. 10).

Movements of Ciliata.—H. S. Jennings has made a very detailed study of these movements, which resemble those of most minute free-swimming organisms. The following account applies practically to all active "Infusoria" in the widest sense.

The position of the free-swimming Infusoria, like that of Rotifers and other small swimming animals, is with the front end of the body inclined outward to the axis of advance, constantly changing its azimuth while preserving its angle constant or nearly so; if advance were ignored the body would thus rotate so as to trace out a cone, with the hinder end at the apex, and the front describing the base. On any irritation, (1) the motion is arrested, (2) the animal reverses its cilia and swims backwards, (3) it swerves outwards away from the axis so as to make a larger angle with it, and (4) then swims forwards along a new axis of progression, to which it is inclined at the same angle as to the previous axis (figs. vi., vii.). In this way it alters its axis of progression when it finds itself under conditions of stimulation. Thus a *Paramecium* coming into a region relatively too cold, too hot, or too poor in CO_2 or in nutriment, alters its direction of swimming; in this way individuals come to assemble in crowds where food is abundant, or even where there is a slight excess of CO_2. This reaction may lead to fatal results; if a solution of corrosive sublimate (Mercuric chloride) diffuses towards the hinder end of the animal faster than it progresses, the stimulus affecting the hinder end first, the axis of progression is altered so as to bring the

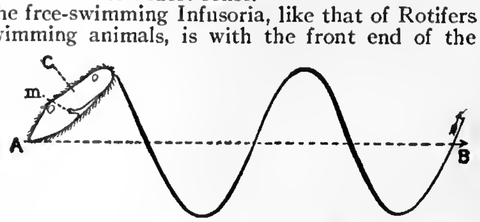


FIG. vii.—Diagram of a mode of progression of a Ciliate like *Paramecium*; *m*, mouth and pharynx; the straight line A, B, represents the axis of progression described by the posterior end, and the spiral line the curve described by the anterior end; the clear circles are the contractile vacuoles on the dorsal side.

animal after a few changes into a region where the solution is strong enough to kill it. This "motile reaction," first noted by H. S. Jennings, is the explanation of the general reactions of minute swimming animals to most stimuli of whatever character, including light; the practical working out is, as he terms it, a method of "trial and error." The action, however, of a current of electricity is distinctly and immediately directive; but such a stimulus is not to be found in nature. The motile reaction in the Hypotrichaceae which crawl or dart in a straight line is somewhat different, the swerve being a simple turn to the right hand—*i.e.* away from the mouth.

Parasitism in the Infusoria is by no means so important as among Flagellates. *Ichthyophthirius* alone causes epidemics among Fishes, and *Balantidium coli* has been observed in intestinal disease in Man. The Isotricheae, among Aspirotrichaceae and the Ophryoscolecidae among Heterotrichaceae are found in abundance in the stomachs of Ruminants, and are believed to play a part in the digestion of cellulose, and thus to be rather commensals than parasites. A large number of attached species are epizoic commensals, some very indifferent in choice of their host, others particular not only in the species they infest, but also in the special organs to which they adhere. This is notably the case with the shelled Peritrichaceae. *Lichnophora* and *Trichodina* (fig. iii. 8, 9) among Peritrichaceae are capable of locomotion by their permanent posterior wreath or of attaching themselves by the sucker which surrounds it; *Kerona polyporum* glides habitually over the body of Hydra, as does *Trichodina pediculus*.

Several Suctoria are endoparasitic in Ciliata, and their occurrence led to the view that they represented stages in the life-history of these. Again, we find in the endosarc of certain Ciliates green nucleated cells, which have a cellulose envelope and multiply by fission inside or outside the animal. They are symbiotic Algae, or possibly the resting state of a Chlamydomonadine Flagellate (*Carteria*?), and have received the name *Zoochlorella*. They are of constant occurrence in *Paramecium bursaria*, frequent in *Stentor polymorphus* and *S. igneus*, and *Ophrydium versatile*, and a few other species, which become infected by swallowing them.

Classification.

Order I.—Section A.—Gymnostomaceae. Mouth habitually closed; swallowing an active process; cilia (or membranelles) uniform, usually distributed evenly over the body; form variable, sometimes of circular transverse section.

Section B.—Trichostomata. Mouth permanently open against the endosarc, provided with 1 or 2 undulating membranes often prolonged into an inturned pharynx; ingestion by action of oral ciliary apparatus.

Order 2.—Subsection (*a*).—Aspirotrichaceae. Cilia nearly uniform, not associated with cirrhi or membranelles, nor forming a peristomial wreath. Form usually flattened, mouth unilateral. (N.B.—Orders 1, 2 are sometimes united into the single order Holotrichaceae.)

Subsection (*b*).—Spirotricha. Wreath of distinct membranelles—or of cilia fused at the base—enclosing a peristomial area and leading into the mouth.

§§ i.—Wreath of separate membranelles.

Order 3.—Heterotrichaceae; body covered with fine uniform cilia, usually circular in transverse section.

Order 4.—Oligotrichaceae; body covering partial or wholly absent; transverse section usually circular.

Order 5.—Hypotrichaceae; body flattened; body cilia represented chiefly by stiff cirrhi in ventral rows, and fine motionless dorsal sensory hairs.

Order 6.—§§ ii.—Peritrichaceae. Peristomial ciliary wreath, spiral, of cilia united at the base; posterior wreath circular of long membranelles; body circular in section, cylindrical, taper, or bell-shaped.

Illustrative Genera (selected).

1. Gymnostomaceae. (*a*) Ciliation general or not confined to one surface. *Coleps* Ehr., with pellicle locally hardened into mailed plates; *Trachelocerca* Ehr.; *Prorodon* Ehr. (fig. i. 6, 7); *Trachelius* Ehr., with branching endosarc (fig. i. 8); *Lacrymaria* Ehr. (fig. i. 5), body produced into a long neck with terminal mouth surrounded by offensive trichocysts; *Dileptus* Duj., of similar form, but anterior process, blind, preoral; *Ichthyophthirius* Fouquet (fig. i. 9-12), cilia represented by two girdles of membranellae; *Didinium* St. (fig. i. 13), cilia in tufts, surface with numerous tentacles each with a strong terminal trichocyst; *Actinobolus* Stein, body with one adoral tentacle; *Ileonema* Stokes. (*b*) Cilia confined to dorsal surface. *Chilodon* Ehr.; *Loxodes* Ehr., body flattened, ciliated on one side only, endosarc as in *Trachelius*; *Dysteria* Huxley, with the dorsal surface hardened and hinged along the median line into a bivalve shell, ciliated only on ventral surface, with a protrusible foot-like process, and a complex pharyngeal armature. (*c*) Cilia restricted to a single equatorial girdle, strong (probably membranelles); *Mesodinium*, mouth 4-lobed.

2. Aspirotrichaceae. *Paramecium* Hill (fig. ii. 1-3); *Ophryoglena* Ehr.; *Colpoda* O. F. Müller; *Colpidium* St.; *Lembus* Cohn, with posterior strong cilium for springing; *Leucophrys* St.; *Urocentrum* Nitsch, bare, with polar and equatorial zones and a posterior tuft of long cilia; *Opalinopsis* Foetlinger (fig. i. 1, 2); *Anoplophyra* St. (fig. i. 3, 4). (The last two parasitic mouthless genera are placed here doubtfully.)

3. Heterotrichaceae. (*a*) Wreath spiral; *Stentor* Oken. (fig. iii. 2), oval when free, trumpet-shaped when attached by pseudopods at apex, and then often secreting a gelatinous tube; *Blepharisma* Perty, sometimes parasitic in Heliozoa; *Spirostomum* Ehr., cylindrical, up to 1″ in length; (*b*) Wreath straight, often oblique; *Nyctotherus* Leidy, parasitic anus always visible; *Balantidium* Cl. and L., parasitic (*B. coli* in man); *Bursaria*, O.F.M., hollowed into an oval pouch, with the wreath inside.

4. Oligotrichaceae. *Tintinnus* Schranck (fig. iii. 3); *Trichodinopsis* Cl. and L.; *Codonella* Haeck. (fig. iii. 5); *Strombidium* Cl. and L. (fig. iii. 4), including *Torquatella* Lank. (fig. iii. 6, 7), according to Bütschli; *Halteria* Duj., with an equatorial girdle of stiff bristle-like cilia; *Caenomorpha* Perty (fig. iii. 23, 24); *Ophryoscolex* St., with straight digestive cavity, and visible anus, parasitic in Ruminants.

5. Hypotrichaceae. *Stylonychia* Ehr.; *Oxytricha* Ehr.; *Euplotes* Ehr. (fig. i. 14, 15); *Kerona* Ehr. (epizoic on *Hydra*).

6. Peritrichaceae. 1. Peristomial wreath projecting when expanded above a circular contractile collar-like rim.

(*a*) Fam. Urceolaridae: posterior wreath permanently present around sucker-like base. *Trichodina* Ehr. (fig. iii. 8, 9), epizoic on Hydra; *Lichnophora* Cl. and L.; *Cyclochaeta* Hatchett Jackson; *Gerda* Cl. and L.; *Scyphidia* Duj.

(*b*) Fam. Vorticellidae = Bell Animalcules: posterior wreath temporarily present, shed after fixation.

Subfam. 1. Vorticellinae animals naked. (i.) Solitary; *Vorticella* Linn. (fig. iii. 11-17), stalk hollow with spiral muscle; *Pyxidium* S. Kent, stalk non-contractile. (ii.) Forming colonies by budding on a branched stalk: *Carchesium* Ehr., hollow branches and muscles discontinuous; *Zoothamnium*. Ehr., branched hollow stem and muscle continuous through colony; *Epistylis* Ehr., stalk rigid—(the animal body in these three genera has the same characters as *Vorticella*)—*Campanella* Goldf., stalked like *Epistylis*, wreath of many turns (nematocysts sometimes present) (fig. iii. 19); *Opercularia*, stalk of *Epistylis*, disk supporting wreath obconical, collar very high (fig. iii. 20).

Subfam. 2. Vaginicolinae; body enclosed in a firm theca: *Vaginicola* Lam., shell simple, sessile; *Thuricola* St. Wright, shell sessile, with a valve opening inwards (fig. iii. 25-26); *Cothurnia* Ehr., shell stalked, simple; *Pyxicola* S. Kent, shell stalked, closed by an infraperistomial opercular thickening on the body (fig. iii. 21-22).

Subfam. 3. Shells gelatinous; those of the colony aggregated into a floating spheroidal mass several inches in diameter. *Ophrydium* Bory, *O. versatile* contains *Zoochlorella*, which secretes oxygen, and the gas-bubbles float the colonies like green lumps of jelly.

2. Peristomial wreath, not protrusible, surrounded by a very high usually spiral collar.

Fam. Spirochonina. *Spirochona* St. (fig. iii. 10); *Kentrochona* Rompel; both genera epizoic on gills, &c., of small Crustacea.

Suctoria.—These are distinguished from Ciliata by their possession of hollow tentacles (one only in *Rhyncheta*, fig. viii. 1, and *Urnula*) through which they ingest food, and by not possessing cilia, except in the young stage. Fission approximately equal is very rare. Usually it is unequal, or if nearly equal one of the halves remains attached, and the other, as an embryo or gemmule, develops cilia and swims off to attach itself elsewhere; *Sphaerophrya* (fig. viii. 2-6) alone, often occurring as an endoparasite in Ciliata, may be free, tentaculate and unattached.

The ectosarc is usually provided with a firm pellicle which shows a peculiar radiate "milling" in optical section, so fine that its true nature is difficult to make out; it may be due to radial rods, regularly imbedded, or may be the expression of radial vacuoles. The tentacles vary in many respects, but are always retractile. They are tubes covered by an extension of the pellicle; this is invaginated into the body round the base of the tentacle as a sheath, and then evaginated to form the outer layer of the tentacle itself, over which it is frequently raised into a spiral ridge, which may be traced down into the part sunk and ensheathed within the body: in *Choanophrya*, where the tentacles are largest, the pellicle is further continued into the interior of the tentacle. The tentacles are always pierced by a central canal opening at the apex, which may be (1) enlarged into a terminal capitate sucker, (2) slightly flared, (3) truncate and closed in the resting state to become widely opened into a funnel, or (4) pointed. The tentacles are always capable of being waved from side to side, or turned in a definite direction for the reception or prehension of food; in *Rhyncheta*, the movements of the long single tentacle recall those of an elephant's trunk, only they are more extensive and more varied. In the majority of cases the food consists of Ciliata: and the contents of the prey may be seen passing down the canal of the sucker beyond where it becomes free from the general surface. In *Choanophrya* the food appears to consist of the débris of the prey of the carnivorous host (*Cyclops*), which is sucked into the wide funnel-shaped mouths of the tentacles—by what mechanism is

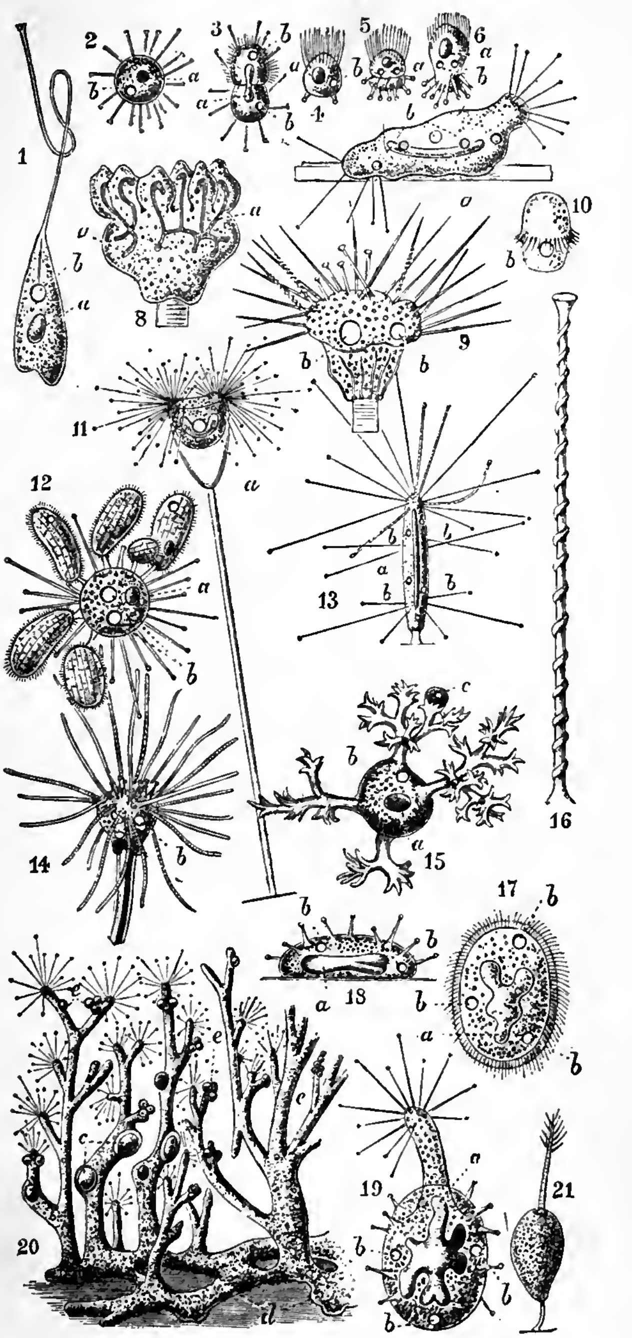

FIG. viii.—Suctoria (in all *a*, meganucleus; *b*, contractile vacuole).

1, *Rhyncheta cyclopum*, Zenker; only a single tentacle and that suctorial; × 150; epizoic on Cyclops.
2, *Sphaerophrya urostylae*, Maupas; normal adult; × 200; parasitic in Ciliate *Urostyla*.
3, The same dividing by transverse fission, the anterior moiety with temporarily developed cilia.
4, 5, 6, *Sphaerophrya stentorea*, Maupas; × 200. Parasitic in *Stentor*, and at one time mistaken for its young.
7, *Trichophrya epistylidis*, Cl. and L.; × 150.
8, *Hemiophrya gemmipara*, Hertwig; × 400. Example with six buds, into each of which a branch of the meganucleus *a* is extended.
9, The same species, showing the two kinds of tentacles (the suctorial and the pointed), and two contractile vacuoles *b*.
10, Ciliated embryo of *Podophrya steinii*, Cl. and L.; × 300.
11, *Acineta grandis*, Saville Kent; × 100; showing pedunculated cup, and animal with two bunches of entirely suctorial tentacles.
12, *Sphaerophrya magna*, Maupas; × 300. It has seized with its tentacles, and is in the act of sucking out the juices of six examples of the Ciliate *Colpoda parvifrons*.
13, *Podophrya elongata*, Cl. and L.; × 150.
14, *Hemiophrya benedenii*, Fraip.; × 200; the suctorial tentacles retracted.
15, *Dendrocometes paradoxus*, Stein; × 350. Parasitic on *Gammarus pulex*; captured prey.
16, A single tentacle of *Podophrya*; × 800. R. Hertwig.
17-20, *Dendrosoma radians*, Ehr.:—17, free-swimming ciliated embryo; × 600. 18, Earliest fixed condition of the embryo; × 600. 19, Later stage, a single tentaculiferous process now developed; × 600. 20, Adult colony; *c*, enclosed ciliated embryos; *d*, branching stolon; *e*, more minute reproductive (?) bodies.
21, *Ophryodendron pedicellatum*, Hincks; × 300.

unknown. The endosarc is full of food-granules and reserve-granules (oil, colouring matter and proteid).

The meganucleus and the micronucleus are both usually single, but in *Dendrosoma* (fig. viii. 20), of which the body is branched, and the meganucleus with it, there are numerous micronuclei. In most cases the micronucleus has not been recorded, though from the similarity of conjugation, and its presence in most cases of fission and budding that have been accurately described, we may infer that it is always present. In unequal fission the meganucleus sends a process into the bud, while the micronucleus divides as in Ciliata. The bud may be nearly equal to the remains of the original animal, or much smaller, and in that case a depression surrounds it which may deepen so as to form a brood-cavity, either communicating by a mere "birth-pore" with the outside or entirely closed. In some cases the budding is multiple (fig. viii. 8), and a large number of buds are formed and liberated at the same time. In all cases the bud escapes without tentacles, and possesses a characteristic supply of cilia, whose arrangement is constant for the species.

In some cases an adult may withdraw its tentacles, moult its pellicle and develop an equipment of cilia and swim away: this is the case with *Dendrocometes*, parasitic on *Gammarus*, when its host moults.

The numerous species of Suctoria, often so abundant on various species of *Cyclops*, are not found on the other fresh-water Copepoda, *Diaptomus* and *Canthocamptus*, belonging indeed to other families. Again, these Suctoria affect different positions, those found on the antennae not being present on the mouth parts; the ventral part of the thorax has another set; and the inside of the pleural fold another. *Rhyncheta* occupies the front of the "couplers" or median downgrowths uniting the coxopodites of the swimming legs, and *Choanophrya* settles in the immediate neighbourhood of the mouth, preferably on the epistoma, labrum and metastomatic region, but also on the adoral appendages and in rare cases extends, when the settlement is extensive, to the bases of the two pairs of antennae; while distinct species of *Podophrya* settle on the antennae, the front of the thorax and the inside of the pleural folds. *Dendrocometes* is common on the gills of the freshwater shrimp (Amphipod) *Gammarus* and *Stylocometes* on the gills and gill-covers of the Isopod *Asellus*, the water-slater. The independence of the Acinetaria was threatened by the erroneous view of Stein that they were phases in the life-history of Vorticellidae. Small parasitic forms (*Sphaerophrya*) were also regarded erroneously as the "acinetiform young" of Ciliata. They now must be regarded as an extreme modification of the Protozoon series, in which the differentiation of organs in a unicellular animal reaches its highest point.

Principal Genera.

1. Unstalked simple forms. *Urnula* Cl. and L., permanently ciliate; *Rhyncheta* Zenker (fig. viii. 1), on the limb couplers of *Cyclops*; *Sphaerophrya* Cl. and L. (fig. viii. 2-6, 12), endoparasitic in Ciliata and formerly taken for embryos thereof, never attached; *Trichophrya* Cl. and L. (fig. viii. 7), of similar habits, but temporarily attached, sessile.

2. Stalked simple forms; *Podophrya* Ehr. (fig. viii. 10, 13, 16), tentacles all knobbed or flared; *Ephelota* Strethill Wright, tentacles all pointed; *Hemiophrya* S. Kent (fig. viii. 8, 9, 14), tentacles of both kinds; *Choanophrya* Hartog, tentacles thick, truncate, very retractile, when expanded opening into funnels for aspiration of floating prey, never for attachment—epizoic on antero-ventral parts of *Cyclops*.

3. Cupped forms; *Solenophrya* Cl. and L., cup sessile; *Acineta* Ehr., cup stalked; *Acinetopsis* Bütschli, like *Acineta*, but the cup flattened, closed distally with only slit-like apertures ("pylomes") for the bundles of tentacles; *Podocyathus*, like *Acineta*, but with pointed as well as knobbed tentacles.

4. Tentacles in bundles at the tips of one or more processes or branches of the body. *Ophryodendron* Cl. and L., tentaculiferous process single (fig. viii. 21); *Dendrocometes* Stein (fig. viii. 15), body rounded, processes repeatedly branched, epizoic on gills of *Gammarus pulex*; *Dendrosoma* Ehr. (fig. viii. 17-20), body freely branched from a basal attached stolon, meganucleus branching with the body.

INGEBORG [Ingeburge, Ingelburge, Ingelborg, Isemburge, Dan. Ingibjörg] (*c.* 1176–1237 or 1238), queen of France, was the daughter of Valdemar I., king of Denmark. She married in 1193 Philip II. Augustus, king of France, but on the day after his marriage the king took a sudden aversion to her, and wished to obtain a separation. During almost twenty years he strained every effort to obtain from the church the declaration of nullity of his marriage. The council of Compiègne acceded to his wish on the 5th of November 1193, but the popes Celestine III. and Innocent III. successively took up the defence of the unfortunate queen. Philip, having married Agnes of Meran in June 1196, was excommunicated, and as he remained obdurate, the kingdom was placed under an interdict. Agnes was finally sent away, but Ingeborg, shut up in the château of Étampes, had to undergo all sorts of privations and vexations. The king attempted to induce her to solicit a divorce herself, or to enter a convent. At last, however (1213), hoping perhaps to justify by his wife's claims his pretensions to England, Philip was reconciled with Ingeborg, whose life from henceforth was devoted to religion. She survived him more than fourteen years, passing the greater part of the time in the priory of St Jean at Corbeil, which she had founded.

See Robert Davidson, *Philip II. August von Frankreich und Ingeborg* (Stuttgart, 1888); and E. Michael, "Zur Geschichte der Königin Ingelborg" in the *Zeitschrift für Katholische Theologie* (1890).

INGELHEIM (Ober-Ingelheim and Nieder-Ingelheim), the name of two contiguous market-towns of Germany, in the grand-duchy of Hesse-Darmstadt, on the Selz, near its confluence with the Rhine, 9 m. W.N.W. of Mainz on the railway to Coblenz. Ober-Ingelheim, formerly an imperial town, is still surrounded by walls. It has an Evangelical church with painted windows representing scenes in the life of Charlemagne, a Roman Catholic church and a synagogue. Its chief industry is the manufacture of red wine. Pop. (1900) 3402. Nieder-Ingelheim has an Evangelical and a Roman Catholic church, and, in addition to wine, manufactories of paper, chemicals, cement and malt. Pop. 3435.

Nieder-Ingelheim is, according to one tradition, the birthplace of Charlemagne, and it possesses the ruins of an old palace built by that emperor between 768 and 774. The building contained one hundred marble pillars, and was also adorned with sculptures and mosaics sent from Ravenna by Pope Adrian I. It was extended by Frederick Barbarossa, and was burned down in 1270, being restored by the emperor Charles IV. in 1354. Having passed into the possession of the elector palatine of the Rhine, the building suffered much damage during a war in 1462, the Thirty Years' War, and the French invasion in 1689. Only few remains of it are now standing; but of the pillars, several are in Paris, one is in the museum at Wiesbaden and another on the Schillerplatz in Mainz. Inside its boundaries there is the restored Remigius Kirche, apparently dating from the time of Frederick I.

See Hilz, *Der Reichspalast zu Ingelheim* (Ober-Ingelheim, 1868); and Clemen, "Der Karolingische Kaiserpalast zu Ingelheim," in *Westdeutsche Zeitschrift*, Band ix. (Trier, 1890).

INGELOW, JEAN (1820–1897), English poet and novelist, was born at Boston, in Lincolnshire, on the 17th of March 1820. She was the daughter of William Ingelow, a banker of that town. As a girl she contributed verses and tales to the magazines under the pseudonym of "Orris," but her first (anonymous) volume, *A Rhyming Chronicle of Incidents and Feelings*, did not appear until her thirtieth year. This Tennyson said had "very charming things" in it, and he declared he should "like to know" the author, who was later admitted to his friendship. Miss Ingelow followed this book of verse in 1851 with a story, *Allerton and Dreux*, but it was the publication of her *Poems* in 1863 which suddenly raised her to the rank of a popular writer. They ran rapidly through numerous editions, were set to music, and sung in every drawing-room, and in America obtained an even greater hold upon public estimation. In 1867 she published *The Story of Doom and other Poems*, and then gave up verse for a while and became industrious as a novelist. *Off the Skelligs* appeared in 1872, *Fated to be Free* in 1873, *Sarah de Berenger* in 1880, and *John Jerome* in 1886. She also wrote *Studies for Stories* (1864), *Stories told to a Child* (1865), *Mopsa the Fairy* (1869), and other excellent stories for children. Her third series of *Poems* was published in 1885. She resided for the last years of her life in Kensington, and somewhat outlived her popularity as a poet. She died on the 20th of July 1897. Her poems, which were collected in one volume in 1898, have often the genuine ballad note, and as a writer of songs she was exceedingly successful. "Sailing beyond Seas" and "When Sparrows build" in *Supper at the Mill* were deservedly among the most popular songs of the day; but they share, with the rest of her work, the faults of affectation and stilted phraseology. Her best-known poem was the "High Tide on the Coast of Lincolnshire," which reached the highest level of excellence. The blemishes of her style were cleverly indicated in a well-known parody of Calverley's; a false archaism and a deliberate assumption of unfamiliar and unnecessary synonyms for simple objects were among the most vicious of her mannerisms. She wrote, however, in verse with a sweetness which her sentiment and her heart inspired, and in prose she displayed feeling for character and the gift of narrative; while a delicate underlying tenderness is never wanting in either medium to her sometimes tortured expression. Miss Ingelow was a woman of frank and hospitable manners, with a look of the Lady Bountiful of a country parish. She had nothing of the professional authoress or the "literary lady" about her, and, as with characteristic simplicity she was accustomed to say, was no great reader. Her temperament was rather that of the improvisatore than of the professional author or artist.

INGEMANN, BERNHARD SEVERIN (1789–1862), Danish poet and novelist, was born at Torkildstrup, in the island of Falster, on the 28th of May 1789. He was educated at the grammar school at Slagelse, and entered the university of Copenhagen in 1806. His studies were interrupted by the English invasion, and on the first night of the bombardment of the city Ingemann stood with the young poet Blicher on the walls, while the shells whistled past them, and comrades were killed on either side. All his early and unpublished writings were destroyed when the English burned the town. In 1811 he published his first volume of poems, and in 1812 his second, followed in 1813 by a book of lyrics entitled *Procne* and in 1814 the verse romance, *The Black Knights*. In 1815 he published two tragedies, *Masaniello and Blanca*, followed by *The Voice in the Desert*, *The Shepherd of Tolosa*, and other romantic plays. After a variety of publications, all very successful, he travelled in 1818 to Italy. At Rome he wrote *The Liberation of Tasso*, and returned in 1819 to Copenhagen. In 1820 he began to display his real power in a volume of delightful tales. In 1821 his dramatic career closed with the production of an unsuccessful comedy, *Magnetism in a Barber's Shop*. In 1822 the poet was nominated lector in Danish language and literature at Sorö College, and he now married. *Valdemar the Great and his Men*, an historical epic, appeared in 1824. The next few years were occupied with his best and most durable work, his four great national and historical novels of *Valdemar Seier*, 1826; *Erik Menved's Childhood*, 1828; *King Erik*, 1833; and *Prince Otto of Denmark*, 1835. He then returned to epic poetry in *Queen Margaret*, 1836, and in a cycle of romances, *Holger Danske*, 1837. His later writings consist of religious and sentimental lyrics, epic poems, novels, short stories in prose, and fairy tales. His last publication was *The Apple of Gold*, 1856. In 1846 Ingemann was nominated director of Sorö College, a post from which he retired in 1849. He died on the 24th of February 1862. Ingemann enjoyed during his lifetime a popularity unapproached even by that of Öhlenschläger. His boundless facility and fecundity, his sentimentality, his religious melancholy, his direct appeal to the domestic affections, gave him instant access to the ear of the public. His novels are better than his poems; of the former the best are those which are directly modelled on the manner of Sir Walter Scott. As a dramatist he outlived his reputation, and his unwieldy epics are now little read.

Ingemann's works were collected in 41 vols. at Copenhagen (1843–1865). His autobiography was edited by Galskjöt in 1862; his correspondence by V. Heise (1879–1881); and his letters to Grundtvig by S. Grundtvig (1882). See also H. Schwanenflügel, *Ingemanns Liv og Digtning* (1886); and Georg Brandes, *Essays* (1889).

INGERSOLL, ROBERT GREEN (1833–1899), American lawyer and lecturer, was born in Dresden, New York, on the 11th of August 1833. His father was a Congregational minister, who removed to Wisconsin in 1843 and to Illinois in 1845. Robert, who had received a good common-school education, was admitted to the bar in 1854, and practised law with success in Illinois. Late in 1861, during the Civil War, he organized a cavalry regiment, of which he was colonel, until captured at Lexington, Tennessee, on the 18th of December 1862, by the Confederate cavalry under General N. B. Forrest. He was paroled, waited in vain to be exchanged, and in June 1863 resigned from the service. He was attorney-general of Illinois in 1867–1869, and in 1876 his speech in the Republican National Convention, naming James G. Blaine for the Presidential candidate, won him a national reputation as a public speaker. As a lawyer he distinguished himself particularly as counsel for the defendants in the "Star-Route Fraud" trials. He was most widely known, however, for his public lectures attacking the Bible, and his anti-Christian views were an obstacle to his political advancement. Ingersoll was an eloquent rhetorician rather than a logical reasoner. He died at Dobbs Ferry, N.Y., on the 21st of July 1899.

His principal lectures and speeches were published under the titles: *The Gods and Other Lectures* (1876); *Some Mistakes of Moses* (1879); *Prose Poems* (1884); *Great Speeches* (1887). His lectures, entitled "The Bible," "Ghosts," and "Foundations of Faith," attracted particular attention. His complete works were published in 12 vols. in New York in 1900.

INGERSOLL, a town and port of entry of Oxford county, Ontario, Canada, 19 m. E. of London, on the river Thames and the Grand Trunk and Canadian Pacific railways. Pop. (1901) 4572. The principal manufactures are agricultural implements, furniture, pianos and screws. There is a large export trade in cheese and farm produce.

INGHAM, CHARLES CROMWELL (1796–1863), American artist, was born in Dublin, Ireland. He was a pupil of the Dublin Academy, emigrated to the United States at the age of twenty-one, and immediately became identified with the art life of that country, being one of the founders of the National Academy of New York in 1826 and its vice-president from 1845 to 1850. He painted portraits of the reigning beauties of New York and acquired considerable reputation, continuing to practise his profession until his death, in New York, on the 10th of December 1863.

INGHIRAMI, the name of an Italian noble family of Volterra. The following are its most important members:

Tommaso Inghirami (1470–1516), a humanist, is best known for his Latin orations, seven of which were published in 1777. His success in the part of Phaedra in a presentation of Seneca's *Hippolytus* (or *Phaedra*) led to his being generally known as *Fedra*. He received high honours from Alexander VI., Leo X. and Maximilian I.

Francesco Inghirami (1772–1846), a distinguished archaeologist, fought in the French wars (1799), and afterwards devoted himself especially to the study of Etruscan antiquities. He founded a college at Fiesole and collected, though without critical insight, a mass of valuable material in his *Monumenti etruschi* (10 vols., 1820–1827), *Galleria omerica* (3 vols., 1829–1851), *Pitture di vasi fittili* (1831–1837), *Museo etrusco chiusino* (2 vols., 1833), and the incomplete *Storia della Toscana* (1841–1845): these works were elaborately illustrated.

His brother, Giovanni Inghirami (1779–1851), was an astronomer of repute. He was professor of astronomy at the Institute founded by Ximenes in Florence and published beside a number of text-books *Effemeridi dell' occultazione delle piccole stelle sotto la luna* (1809–1830); *Effemeridi di Venese e Giove all' uso de' naviganti* (1821–1824); *Tavole astronomichi universali portatili* (1811); *Base trigonometrica misurata in Toscana* (1818); *Carta topografica e geometrica della Toscana* (1830).

INGLEBY, CLEMENT MANSFIELD (1823–1886), English Shakespearian scholar, was born at Edgbaston, Birmingham, on the 29th of October 1823, the son of a solicitor. After taking his degree at Trinity College, Cambridge, he entered his father's office, eventually becoming a partner. In 1859 he abandoned the law and left Birmingham to live near London. He contributed articles on literary, scientific and other subjects to various magazines, but from 1874 devoted himself almost entirely to Shakespearian literature. His first work in this field had been an exposure of the manipulations of John Payne Collier, entitled *The Shakespeare Fabrications* (1859); his work as a commentator began with *The Still Lion* (1874), enlarged in the following year into *Shakespeare Hermeneutics*. In this book many of the then existing difficulties of Shakespeare's text were explained. In the same year (1875) he published the *Centurie of Prayse*, a collection of references to Shakespeare and his works between 1592 and 1692. His *Shakespeare: the Man and the Book* was published in 1877–1881; he also wrote *Shakespeare's Bones* (1882), in which he suggested the disinterment of Shakespeare's bones and an examination of his skull. This suggestion, though not due to vulgar curiosity, was regarded, however, by public opinion as sacrilegious. He died on the 26th of September 1886, at Ilford, Essex. Although Ingleby's reputation now rests solely on his works on Shakespeare, he wrote on many other subjects. He was the author of hand-books on metaphysic and logic, and made some contributions to the study of natural science. He was at one time vice-president of the New Shakspere Society, and one of the original trustees of the "Birthplace."

INGLEFIELD, SIR EDWARD AUGUSTUS (1820–1894), British admiral and explorer, was born at Cheltenham, on the 27th of March 1820, and educated at the Royal Naval College, Portsmouth. His father was Rear-Admiral Samuel Hood Inglefield (1783–1848), and his grandfather Captain John Nicholson Inglefield (1748–1828), who served with Lord Hood against the French. The boy went to sea when fourteen, took part in the naval operations on the Syrian Coast in 1840, and in 1845 was promoted to the rank of commander for gallant conduct at Obligado. In 1852 he commanded Lady Franklin's yacht "Isabel" on her cruise to Smith Sound, and his narrative of the expedition was published under the title of *A Summer Search for Sir John Franklin* (1853). He received the gold medal of the Royal Geographical Society on his return, and was given command of the "Phoenix," in which he made three trips to the Arctic, bringing home part of the Belcher Arctic expedition in 1854. In that year he was again sent out on the last attempt made by the Admiralty to find Sir John Franklin.

In the Crimean War Captain Inglefield took part in the siege of Sevastopol. He was knighted in 1877, and nominated a Knight Commander of the Bath ten years later. He was promoted admiral in 1879. Besides being an excellent marine artist, he was the inventor of the hydraulic steering gear and the Inglefield anchor. He died on the 5th of September 1894. His son, Captain Edward Fitzmaurice Inglefield (b. 1861), became secretary of Lloyds in 1906. Sir Edward Inglefield's brother, Rear-Admiral V. O. Inglefield, was the father of Rear-Admiral Frederick Samuel Inglefield (b. 1854), director of naval intelligence in 1902–1904, and of two other sons distinguished as soldiers.

INGLE-NOOK (from Lat. *igniculus*, dim. of *ignis*, fire), a corner or seat by the fireside, within the chimney-breast. The open Tudor or Jacobean fire-place was often wide enough to admit of a wooden settle being placed at each end of the embrasure of which it occupied the centre, and yet far enough away not to be inconveniently hot. This was one of the means by which the builder sought to avoid the draughts which must have been extremely frequent in old houses. English literature is full of references, appreciatory or regretful, to the cosy ingle-nook that was killed by the adoption of small grates. Modern English and American architects are, however, fond of devising them in houses designed on ancient models, and owners of old buildings frequently remove the modern grates and restore the original arrangement.

INGLIS, SIR JOHN EARDLEY WILMOT (1814–1862), British major-general, was born in Nova Scotia on the 15th of November 1814. His father was the third, and his grandfather the first, bishop of that colony. In 1833 he joined the 32nd Foot, in which all his regimental service was passed. In 1837 he saw active service in Canada, and in 1848–1849 in the Punjab, being in command at the storming of Mooltan and at the battle of Gujrat. In 1857, on the outbreak of the Indian Mutiny, he was in command of his regiment at Lucknow. Sir Henry Lawrence being mortally wounded during the siege of the residency, Inglis took command of the garrison, and maintained a successful defence for 87 days against an overwhelming force. He was promoted to major-general and made K.C.B. After further active service in India, he was, in 1860, given command of the British troops in the Ionian Islands. He died at Hamburg on the 27th of September 1862.

INGLIS, SIR WILLIAM (1764–1835), British soldier, was born in 1764, a member of an old Roxburghshire family. He entered the army in 1781. After ten years in America he served in Flanders, and in 1796 took part in the capture of St Lucia. In 1809 he commanded a brigade in the Peninsula, taking part in the battle of Busaco (1810) and the first siege of Badajoz. At Albuera his regiment, the 57th, occupied a most important position, and was exposed to a deadly fire. "Die hard! Fifty-Seventh," cried Inglis, "Die hard!" The regiment's answer has gone down to history. Out of a total strength of 579, 23 officers and 415 rank and file were killed and wounded. Inglis himself was wounded. On recovering, he saw further Peninsular service. In two engagements his horse was shot under him. His services were rewarded by the thanks of parliament and in 1825 he became lieutenant-general, and was made a K.C.B. After holding the governorships of Kinsale and Cork, he was, in 1830, appointed colonel of the 57th. He died at Ramsgate on the 29th of November 1835.

INGOLSTADT, a fortified town of Germany, in the kingdom of Bavaria, on the left bank of the Danube at its confluence with the Schutter, 52 m. north of Munich, at the junction of the main lines of railway, Munich, Bamberg and Regensburg-Augsburg. Pop. (1900) 22,207. The principal buildings are the old palace of the dukes of Bavaria-Ingolstadt, now used as an arsenal; the new palace on the Danube; the remains of the earliest Jesuits' college in Germany, founded in 1555; the former university buildings, now a school; the theatre; the large Gothic Frauenkirche, founded in 1425, with two massive towers, containing several interesting monuments, among them the tomb of Dr Eck, Luther's opponent; the Franciscan convent and nunnery; and several other churches and hospitals. Ingolstadt possesses several technical and other schools. In 1472 a university was founded in the town by the Bavarian duke, Louis the Rich, which at the end of the 16th century was attended by 4000 students. In 1800 it was removed to Landshut, whence it was transferred to Munich in 1826. Its newer public buildings include an Evangelical church, a civil hospital, an arsenal and an orphanage. The industries are cannon-founding, manufacture of gunpowder and cloth, and brewing.

Ingolstadt, known as *Aureatum* or *Chrysopolis*, was a royal villa in the beginning of the 9th century, and received its charter of civic incorporation before 1255. After that date it grew in importance, and became the capital of a dukedom which merged in that of Bavaria-Munich. The fortifications, erected in 1539, were put to the test during the contests of the Reformation period and in the Thirty Years' War. Gustavus Adolphus vainly besieged Ingolstadt in 1632, when Tilly, to whom there is a monument in the Frauenkirche, lay mortally wounded within the walls. In the War of the Spanish Succession it was besieged by the margrave of Baden in 1704. In 1743 it was surrendered by the French to the Austrians, and in 1800, after three months' siege, the French, under General Moreau, took the town, and dismantled the fortifications. They were rebuilt on a much larger scale under King Louis I., and since 1870 Ingolstadt has ranked as a fortress of the first class. In 1872 even more important fortifications were constructed, which include têtes-de-pont with round towers of massive masonry, and the redoubt Tilly on the right bank of the river.

See Gerstner, *Geschichte der Stadt Ingolstadt* (Munich, 1853); and Prantl, *Geschichte der Ludwig Maximilians Universität* (Munich, 1872).

INGOT, originally a mould for the casting of metals, but now a mass of metal cast in a mould, and particularly the small bars of the precious metals, cast in the shape of an oblong brick or wedge with slightly sloping sides, in which form gold and silver are handled as bullion at the Bank of England and the Mint. Ingots of varying sizes and shapes are cast of other metals, and "ingot-steel" and "ingot-iron" are technical terms in the manufacture of iron and steel (see IRON AND STEEL). The word is obscure in origin. It occurs in Chaucer ("The Canon's Yeoman's Tale") as a term of alchemy, in the original sense of a mould for casting metal, and, as the *New English Dictionary* points out, an English origin for such a term is unlikely. It may, however, be derived from *in* and the O. Eng. *gêotan* to pour; cf. Ger. *giessen* and *Einguss*, a mould. The Fr. *lingot*, with the second English meaning only, has been taken as the origin of "ingot" and derived from the Lat. *lingua*, tongue—with a supposed reference to the shape. This derivation is wrong, and French etymologists have now accepted the English origin for the word, *lingot* having coalesced from *l'ingot*.

INGRAM, JAMES (1774–1850), English antiquarian and Anglo-Saxon scholar, was born near Salisbury on the 21st of December 1774. He was educated at Warminster and Winchester schools and at Trinity College, Oxford, of which he became a fellow in 1803. From 1803 to 1808 he was Rawlinsonian professor of Anglo-Saxon at Oxford, and in 1824 was made President of Trinity College and D.D. His time, however, was principally spent in antiquarian research, and especially in the study of Anglo-Saxon, in which field he was the pre-eminent scholar of his time. He published in 1823 an edition of the *Saxon Chronicle*. His other works include admirable *Memorials of Oxford* (1832–1837), and *The Church in the Middle Centuries* (1842). He died on the 5th of September 1850.

INGRAM, JOHN KELLS (1823–1907), Irish scholar and economist, was born in Co. Donegal, Ireland, on the 7th of July 1823. Educated at Newry School and Trinity College, Dublin, he was elected a fellow of his college in 1846. He held the professorship of Oratory and English Literature in Dublin University from 1852 to 1866, when he became regius professor of Greek. In 1879 he was appointed librarian. Ingram was remarkable for his versatility. In his undergraduate days he had written the well-known poem "Who fears to speak of Ninety-eight?" and his *Sonnets and other Poems* (1900) reveal the poetic sense. He contributed many important papers to mathematical societies on geometrical analysis, and did much useful work in advancing the science of classical etymology, notably in his *Greek and Latin Etymology in England*, *The Etymology of Liddell and Scott*. His philosophical works include *Outlines of the History of Religion* (1900), *Human Nature and Morals according to A. Comte* (1901), *Practical Morals* (1904), and the *Final Transition* (1905). He contributed to the 9th edition of the *Encyclopaedia Britannica* an historical and biographical article on political economy, which was translated into nearly every European language. His *History of Slavery and Serfdom* was also written for the 9th edition of the *Encyclopaedia Britannica*. He died in Dublin on the 18th of May 1907.

INGRES, JEAN AUGUSTE DOMINIQUE (1780–1867), French painter, was born at Montauban, on the 29th of August 1780. His father, for whom he entertained the most tender and respectful affection, has described himself as *sculpteur en plâtre*; he was, however, equally ready to execute every other kind of decorative work, and now and again eked out his living by taking portraits or obtained an engagement as a violin-player. He brought up his son to command the same varied resources, but in consequence of certain early successes—the lad's performance of a concerto of Viotti's was applauded at the theatre of Toulouse—his attention was directed chiefly to the study of music. At Toulouse, to which place his father had removed from Montauban in 1792, Ingres had, however, received lessons from Joseph Roques, a painter whom he quitted at the end of a few months to become a pupil of M. Vigan, professor at the academy of fine arts in the same town. From Vigan, Ingres, whose vocation became day by day more distinctly evident, passed to M. Briant, a landscape-painter who insisted that his pupil was specially gifted by nature to follow the same line as himself. For a while Ingres obeyed, but he had been thoroughly aroused and enlightened as to his own objects and desires by the sight of a copy of Raphael's "Madonna della Sedia," and, having ended his connexion with Briant, he started for Paris, where he arrived about the close of 1796. He was then admitted to the studio of David, for whose lofty standard and severe principles he always retained a profound appreciation. Ingres, after four years of devoted study, during which (1800) he obtained the second place in the yearly competition, finally carried off the Grand Prix (1801). The work thus rewarded—the "Ambassadors of Agamemnon in the Tent of Achilles" (École des Beaux Arts)—was admired by Flaxman so much as to give umbrage to David, and was succeeded in the following year (1802) by the execution of a "Girl after Bathing," and a woman's portrait; in 1804 Ingres exhibited "Portrait of the First Consul" (Musée de Liége), and portraits of his father and himself; these were followed in 1806 by "Portrait of the Emperor" (Invalides), and portraits of M, Mme, and Mlle Rivière (the first two now in the Louvre). These and various minor works were executed in Paris (for it was not until 1809 that the state of public affairs admitted of the re-establishment of the Academy of France at Rome), and they produced a disturbing impression on the public. It was clear that the artist was some one who must be counted with; his talent, the purity of his line, and his power of literal rendering were generally acknowledged; but he was reproached with a desire to be singular and extraordinary. "Ingres," writes Frau v. Hastfer (*Leben und Kunst in Paris*, 1806) "wird nach Italien gehen, und dort wird er vielleicht vergessen dass er zu etwas Grossem geboren ist, und wird eben darum ein hohes Ziel erreichen." In this spirit, also, Chaussard violently attacked his "Portrait of the Emperor" (*Pausanias Français*, 1806), nor did the portraits of the Rivière family escape. The points on which Chaussard justly lays stress are the strange discordances of colour—such as the blue of the cushion against which Mme Rivière leans, and the want of the relief and warmth of life, but he omits to touch on that grasp of his subject as a whole, shown in the portraits of both husband and wife, which already evidences the strength and sincerity of the passionless point of view which marks all Ingres's best productions. The very year after his arrival in Rome (1808) Ingres produced "Oedipus and the Sphinx" (Louvre; lithographed by Sudre, engraved by Gaillard), a work which proved him in the full possession of his mature powers, and began the "Venus Anadyomene" (Collection Rieset; engraving by Pollet), completed forty years later, and exhibited in 1855. These works were followed by some of his best portraits, that of M. Bochet (Louvre), and that of Mme la Comtesse de Tournon, mother of the prefect of the department of the Tiber; in 1811 he finished "Jupiter and Thetis," an immense canvas now in the Musée of Aix; in 1812 "Romulus and Acron" (École des Beaux Arts), and "Virgil reading the *Aeneid*"—a composition very different from the version of it which has become popular through the engraving executed by Pradier in 1832. The original work, executed for a bedchamber in the Villa Aldobrandini-Miollis, contained neither the figures of Maecenas and Agrippa nor the statue of Marcellus; and Ingres, who had obtained possession of it during his second stay in Rome, intended to complete it with the additions made for engraving. But he never got beyond the stage of preparation, and the picture left by him, together with various other studies and sketches, to the Musée of his native town, remains half destroyed by the process meant for its regeneration. The "Virgil" was followed by the "Betrothal of Raphael," a small painting, now lost, executed for Queen Caroline of Naples; "Don Pedro of Toledo Kissing the Sword of Henry IV." (Collection Deymié; Montauban), exhibited at the Salon of 1814, together with the "Chapelle Sistine" (Collection Legentil; lithographed by Sudre), and the "Grande Odalisque" (Collection Seillière; lithographed by Sudre). In 1815 Ingres executed "Raphael and the Fornarina" (Collection Mme N. de Rothschild; engraved by Pradier); in 1816 "Aretin" and the "Envoy of Charles V." (Collection Schroth), and "Aretin and Tintoret" (Collection Schroth); in 1817 the "Death of Leonardo" (engraved by Richomme) and "Henry IV. Playing with his Children" (engraved by Richomme), both of which works were commissions from M. le Comte de Blacas, then ambassador of France at the Vatican. "Roger and Angelique" (Louvre; lithographed by Sudre), and "Francesca di Rimini" (Musée of Angers; lithographed by Aubry Lecomte), were completed in 1819, and followed in 1820 by "Christ giving the Keys to Peter" (Louvre). In 1815, also, Ingres had made many projects for treating a subject from the life of the celebrated duke of Alva, a commission from the family, but a loathing for "cet horrible homme" grew upon him, and finally he abandoned the task and entered in his diary—"J'étais forcé par la nécessité de peindre un pareil tableau; Dieu a voulu qu'il restât en ébauche." During all these years Ingres's reputation in France did not increase. The interest which his "Chapelle Sistine" had aroused at the Salon of 1814 soon died away; not only was the public indifferent, but amongst his brother artists Ingres found scant recognition. The strict classicists looked upon him as a renegade, and strangely enough Delacroix and other pupils of Guérin—the leaders of that romantic movement for which Ingres, throughout his long life, always expressed the deepest abhorrence—alone seem to have been sensible of his merits. The weight of poverty, too, was hard to bear. In 1813 Ingres had married; his marriage had been arranged for him with a young woman who came in a business-like way from Montauban, on the strength of the representations of her friends in Rome. Mme Ingres speedily acquired a faith in her husband which enabled her to combat with heroic courage and patience the difficulties which beset their common existence, and which were increased by their removal to Florence. There Bartolini, an old friend, had hoped that Ingres might have materially bettered his position, and that he might have aroused the Florentine school—a weak offshoot from that of David—to a sense of its own shortcomings. These expectations were disappointed. The good offices of Bartolini, and of one or two other persons, could only alleviate the miseries of this stay in a town where Ingres was all but deprived of the means of gaining daily bread by the making of those small portraits for the execution of which, in Rome, his pencil had been constantly in request. Before his departure he had, however, been commissioned to paint for M. de Pastoret the "Entry of

Charles V. into Paris," and M. de Pastoret now obtained an order for Ingres from the Administration of Fine Arts; he was directed to treat the "Vœu de Louis XIII." for the cathedral of Montauban. This work, exhibited at the Salon of 1824, met with universal approbation: even those sworn to observe the unadulterated precepts of David found only admiration for the "Vœu de Louis XIII." On his return Ingres was received at Montauban with enthusiastic homage, and found himself celebrated throughout France. In the following year (1825) he was elected to the Institute, and his fame was further extended in 1826 by the publication of Sudre's lithograph of the "Grande Odalisque," which, having been scorned by artists and critics alike in 1819, now became widely popular. A second commission from the government called forth the "Apotheosis of Homer," which, replaced by a copy in the decoration of the ceiling for which it was designed, now hangs in the galleries of the second storey of the Louvre. From this date up till 1834 the studio of Ingres was thronged, as once had been thronged the studio of David, and he was a recognized *chef d'école*. Whilst he taught with despotic authority and admirable wisdom, he steadily worked; and when in 1834 he produced his great canvas of the "Martyrdom of Saint Symphorien" (cathedral of Autun; lithographed by Trichot-Garneri), it was with angry disgust and resentment that he found his work received with the same doubt and indifference, if not the same hostility, as had met his earlier ventures. The suffrages of his pupils, and of one or two men—like Decamps—of undoubted ability, could not soften the sense of injury. Ingres resolved to work no longer for the public, and gladly availed himself of the opportunity to return to Rome, as director of the École de France, in the room of Horace Vernet. There he executed "La Vierge à l'Hostie" (Imperial collections, St Petersburg), "Stratonice," "Portrait of Cherubini" (Louvre), and the "Petite Odalisque" for M. Marcotte, the faithful admirer for whom, in 1814, Ingres had painted the "Chapelle Sistine." The "Stratonice," executed for the duke of Orleans, had been exhibited at the Palais Royal for several days after its arrival in France, and the beauty of the composition produced so favourable an impression that, on his return to Paris in 1841, Ingres found himself received with all the deference that he felt to be his due. A portrait of the purchaser of "Stratonice" was one of the first works executed after his return; and Ingres shortly afterwards began the decorations of the great hall in the Château de Dampierre, which, unfortunately for the reputation of the painter, were begun with an ardour which gradually slackened, until in 1849 Ingres, having been further discouraged by the loss of his faithful and courageous wife, abandoned all hope of their completion, and the contract with the duc de Luynes was finally cancelled. A minor work, "Jupiter and Antiope," marks the year 1851, but Ingres's next considerable undertaking (1853) was the "Apotheosis of Napoleon I.," painted for the ceiling of a hall in the Hôtel de Ville; "Jeanne d'Arc" (Louvre) appeared in 1854; and in 1855 Ingres consented to rescind the resolution, more or less strictly kept since 1834, in favour of the International Exhibition, where a room was reserved for his works. Prince Napoleon, president of the jury, proposed an exceptional recompense for their author, and obtained from the emperor Ingres's nomination as grand officer of the Legion of Honour. With renewed confidence Ingres now took up and completed one of his most charming productions—"La Source" (Louvre), a figure of which he had painted the torso in 1823, and which seen with other works in London (1862) there renewed the general sentiment of admiration, and procured him, from the imperial government, the dignity of senator. After the completion of "La Source," the principal works produced by Ingres were with one or two exceptions ("Molière" and "Louis XIV.," presented to the Théâtre Français, 1858; "Le Bain Turc," 1859), of a religious character; "La Vierge de l'Adoption," 1858 (painted for Mlle Roland-Gosselin), was followed by "La Vierge Couronnée" (painted for Mme la Baronne de Larinthie) and "La Vierge aux Enfans" (Collection Blanc); in 1859 these were followed by repetitions of "La Vierge à l'Hostie"; and in 1862 Ingres completed "Christ and the Doctors" (Musée Montauban), a work commissioned many years before by Queen Marie Amélie for the chapel of Bizy.

On the 17th of January 1867 Ingres died in his eighty-eighth year, having preserved his faculties in wonderful perfection to the last. For a moment only—at the time of the execution of the "Bain Turc," which Prince Napoleon was fain to exchange for an early portrait of the master by himself—Ingres's powers had seemed to fail, but he recovered, and showed in his last years the vigour which marked his early maturity. It is, however, to be noted that the "Saint Symphorien" exhibited in 1834 closes the list of the works on which his reputation will chiefly rest; for "La Source," which at first sight seems to be an exception, was painted, all but the head and the extremities, in 1821; and from those who knew the work well in its incomplete state we learn that the after-painting, necessary to fuse new and old, lacked the vigour, the precision, and the something like touch which distinguished the original execution of the torso. Touch was not, indeed, at any time a means of expression on which Ingres seriously calculated; his constant employment of local tint, in mass but faintly modelled in light by half tones, forbade recourse to the shifting effects of colour and light on which the Romantic school depended in indicating those fleeting aspects of things which they rejoiced to put on canvas;—their methods would have disturbed the calculations of an art wholly based on form and line. Except in his "Sistine Chapel," and one or two slighter pieces, Ingres kept himself free from any preoccupation as to depth and force of colour and tone; driven, probably by the excesses of the Romantic movement into an attitude of stricter protest, "ce que l'on sait" he would repeat, "il faut le savoir l'épée à la main." Ingres left himself therefore, in dealing with crowded compositions, such as the "Apotheosis of Homer" and the "Martyrdom of Saint Symphorien," without the means of producing the necessary unity of effect which had been employed in due measure—as the Stanze of the Vatican bear witness—by the very master whom he most deeply reverenced. Thus it came to pass that in subjects of one or two figures Ingres showed to the greatest advantage: in "Oedipus," in the "Girl after Bathing," the "Odalisque" and "La Source"—subjects only animated by the consciousness of perfect physical well-being—we find Ingres at his best. One hesitates to put "Roger and Angelique" upon this list, for though the female figure shows the finest qualities of Ingres's work,—deep study of nature in her purest forms, perfect sincerity of intention and power of mastering an ideal conception—yet side by side with these the effigy of Roger on his hippogriff bears witness that from the passionless point of view, which was Ingres's birthright, the weird creatures of the fancy cannot be seen.

A graphic account of "Ingres, sa vie et ses travaux," and a complete catalogue of his works, were published by M. Delaborde in 1870, and dedicated to Mme Ingres, *née* Ramel, Ingres's devoted second wife, whom he married in 1852. Allusions to the painter's early days will be found in Delécluze's *Louis David*; and amongst less important notices may be cited that by Théophile Silvestre in his series of living artists. Most of Ingres's important works are engraved in the collection brought out by Magimel. (E. F. S. D.)

INGRESS (Lat. *ingressus*, going in), entrance as opposed to exit or egress; in astronomy, the apparent entrance of a smaller body upon the disk of a larger one, as it passes between the latter and the observer; in this sense it is applied especially to the beginning of a transit of a satellite of Jupiter over the disk of the planet.

INHAMBANE, a seaport of Portuguese East Africa in 23° 50′ S., 35° 25′ E. The town, which enjoys a reputation for healthiness, is finely situated on the bank of a river of the same name which empties into a bay also called Inhambane. Next to Mozambique Inhambane, which dates from the middle of the 16th century, is architecturally the most important town in Portuguese East Africa. The chief buildings are the fort, churches and mosque. The principal church is built with stone and marble brought from Portugal. The population, about 4000 in 1909, is of a motley character: Portuguese and other Europeans, Arabs, Banyans, half-castes and negroes. Its commerce was formerly mostly in ivory and slaves. In 1834 Inhambane was taken and all its inhabitants save ten killed by a Zulu horde under Manikusa (see GAZALAND). It was not until towards the close of the 19th century that the trade of the town revived. The value of exports and imports in 1907 was about £150,000. The chief exports are wax, rubber, mafureira and other nuts, mealies and sugar. Cotton goods and cheap wines (for consumption by natives) are the principal imports. The harbour, about 9 m. long by 5 wide, accommodates vessels drawing 10 to 12 ft. of water. The depth of water over the bar varies from 17 to 28 ft., and large vessels discharge into and load from lighters. Inhambane is the natural port for the extensive and fertile district between the Limpopo and Sabi rivers. This region is the best recruiting ground for labourers in the Rand gold mines. Mineral oils have been found within a short distance of the port.

INHERITANCE. In English law, inheritance, heir and other kindred words have a meaning very different from that of the Latin *haeres*, from which they are derived. In Roman law the heir or heirs represented the entire legal personality of the deceased—his *universum jus*. In English law the heir is simply the person on whom the real property of the deceased devolves by operation of law if he dies intestate. He has nothing to do as heir with the personal property; he is not appointed by will; and except in the case of coparceners he is a single individual. The Roman *haeres* takes the whole estate; his appointment may or may not be by testament; and more persons than one may be associated together as heirs.

The devolution of an inheritance in England is now regulated by the rules of descent, as altered by the Inheritance Act 1833, amended by the Law of Property Amendment Act 1859.

1. The first rule is that inheritance shall descend to the issue of the last "purchaser." A purchaser in law means one who acquires an estate otherwise than by descent, *e.g.* by will, by gratuitous gift, or by purchase in the ordinary meaning of the word. This rule is one of the changes introduced by the Inheritance Act, which further provides that "the person last entitled to the land shall be considered the purchaser thereof unless it be proved that he inherited the same." Under the earlier law descent was traced from the last person who had "seisin" or feudal possession, and it was occasionally a troublesome question whether the heir or person entitled had ever, in fact, acquired such possession. Now the only inquiry is into title, and each person entitled is presumed to be in by purchase unless he is proved to be in by descent, so that the stock of descent is the last person entitled who cannot be shown to have inherited. 2. The male is admitted before the female. 3. Among males of equal degree in consanguinity to the purchaser, the elder excludes the younger; but females of the same degree take together as "coparceners." 4. Lineal descendants take the place of their ancestor. Thus an eldest son dying and leaving issue would be represented by such issue, who would exclude their father's brothers and sisters. 5. If there are no lineal descendants of the purchaser, the next to inherit is his nearest lineal ancestor. This is a rule introduced by the Inheritance Act. Under the former law inheritance never went to an ancestor—collaterals, however remote of the person last seized being preferred even to his father. Various explanations have been given of this seemingly anomalous rule—Bracton and Blackstone being content to say that it rests on the law of nature, by which heavy bodies gravitate downwards. Another explanation is that estates were granted to be descendible in the same way as an ancient inheritance, which having passed from father to son *ex necessitate* went to collaterals on failure of issue of the person last seized. 6. The sixth rule is thus expressed by Joshua Williams in his treatise on *The Law of Real Property*:—

"The father and all the male paternal ancestors of the purchaser and their descendants shall be admitted before any of the female paternal ancestors or their heirs; all the female paternal ancestors and their heirs before the mother or any of the maternal ancestors or her or their descendants; and the mother and all the male maternal ancestors and her and their descendants before any of the female maternal ancestors or their heirs."

7. Kinsmen of the half-blood may be heirs; such kinsmen shall inherit next after a kinsman in the same degree of the whole blood, and after the issue of such kinsman where the common ancestor is a male and next after the common ancestor where such ancestor is a female. The admission of kinsmen of the half-blood into the chain of descent is an alteration made by the Inheritance Act. Formerly a relative, however nearly connected in blood with the purchaser through one only and not both parents, could never inherit—a half-brother for example. 8. In the admission of female paternal ancestors, the mother of the more remote male paternal ancestor and her heirs shall be preferred to the mother of the less remote male paternal and her heirs; and, in the case of female maternal ancestors, the mother of the more remote male maternal ancestor shall be preferred to the mother of a less remote male maternal ancestor. This rule, following the opinion of Blackstone, settles a point much disputed by text-writers, although its importance was little more than theoretical. 9. When there shall be a total failure of heirs of the purchaser, or when any lands shall be descendible as if an ancestor had been the purchaser thereof, and there shall be a total failure of the heirs of such ancestor, then and in every such case the descent shall be traced from the person last entitled to the land as if he had been the purchaser thereof. This rule is enacted by the Law of Property Amendment Act 1859. It would apply to such a case as the following: Purchaser dies intestate, leaving a son and no other relations, and the son in turn dies intestate; the son's relations through his mother are now admitted by this rule. If the purchaser is illegitimate, his only relations must necessarily be his own issue. Failing heirs of all kinds, the lands of an intestate purchaser, not alienated by him, would revert by "escheat" to the next immediate lord of the fee, who would generally be the crown. If an intermediate lordship could be proved to exist between the crown and the tenant in fee simple, such intermediate lord would have the escheat. But escheat is a matter of rare occurrence.

The above rules apply to all freehold land whether the estate therein of the intestate is legal or equitable. Before 1884, if a sole trustee had the legal estate in realty, and his *cestui que trust* died intestate and without heirs, the land escheated to the trustee. This distinction was abolished by the Intestate Estates Act 1884.

The descent of an estate in tail would be ascertained by such of the foregoing rules as are not inapplicable to it. By the form of the entail the estate descends to the "issue" of the person to whom the estate was given in tail—in other words, the last purchaser. The preceding rules after the fourth, being intended for the ascertainment of heirs other than those by lineal descent, would therefore not apply; and a special limitation in the entail, such as to heirs male or female only, would render unnecessary some of the others. When the entail has been barred, the estate descends according to these rules. In copyhold estates descent, like other incidents thereof, is regulated by the custom of each particular manor; *e.g.* the youngest son may exclude the elder sons. How far the Inheritance Act applies to such estates has been seriously disputed. It has been held in one case (*Muggleton* v. *Barnett*) that the Inheritance Act, which orders descent to be traced from the last purchaser, does not override a manorial custom to trace descent from the person last seized, but this position has been controverted on the ground that the act itself includes the case of customary holdings.

Husband and wife do not stand in the rank of heir to each other. Their interests in each other's real property are secured by courtesy and dower.

The personal property of a person dying intestate devolves according to an entirely different set of rules (see INTESTACY).

In Scotland the rules of descent differ from the above in several particulars. Descent is traced, as in England before the Inheritance Act, to the person last seized. The first to succeed are the lineal descendants of the deceased, and the rules of primogeniture, preference of males to females, equal succession of females (heirs-portioners), and representation of ancestors are generally the same as in English law. Next to the lineal descendants, and failing them, come the brothers and sisters, and their issue as collaterals. Failing collaterals, the inheritance ascends to the father and his relations, to the entire exclusion of the mother and her relations. Even when the estate has descended from mother to son, it can never revert to the maternal line. As to succession of brothers, a distinction must be taken between an estate of heritage and an estate of conquest. Conquest is where the deceased has acquired the land otherwise than as heir, and corresponds to the English term purchase in the technical sense explained. Heritage is land acquired by deceased as heir. The distinction is important only in the case when the heir of the deceased is to be sought among his brothers; when the descent is lineal, conquest and heritage go to the same person. And when the brothers are younger than the deceased, both conquest and heritage go to the brother (or his issue) next in order of age. But when the deceased leaves an elder and a younger brother (or their issues), the elder brother takes the conquest, the younger takes the heritage. Again, when there are several elder brothers, the one next in age to the deceased takes the conquest before the more remote, and when there are several younger brothers, the one next to the deceased takes the heritage before the more remote. When heritage of the deceased goes to an elder brother (as might happen in certain eventualities), the younger of the elder brothers is preferred. The position of the father, after the brothers and sisters of the deceased, will be noticed as an important point of difference from the English axioms; so also is the total exclusion of the mother and the maternal line. As between brothers and sisters the half-blood only succeeds after the full blood. Half-blood is either consanguinean, as between children by the same father, or uterine, as between children having the same mother. The half-blood uterine is excluded altogether. Half-blood consanguinean succeeds thus: if the issue is by a former marriage, the youngest brother (being nearest to the deceased of the consanguinean) succeeds first; if by a later marriage than that from which the deceased has sprung, the eldest succeeds first.

United States.—American law has borrowed its rules of descent considerably more from the civil law than the common law. "The 118 novel of Justinian has a striking resemblance to American law in giving the succession of estates to all legitimate children without distinction and disregarding all considerations of primogeniture. There is one particular in which the American law differs from that of Justinian, that while generally in this country lineal descendants if they stand in an equal degree from the common ancestor share equally *per capita*, under the Roman law regard was had to the right of representation, each lineal branch of descendants taking only the portion which their parent would have taken had he been living, the division being *per stirpes* and not *per capita*. But in some of the states the rule of the Roman law in this respect has been adopted and retained. Among these are Rhode Island, New Jersey, North and South Carolina, Alabama and Louisiana" (3 Washburn's *Real Property*, pp. 408, 409; 4 Kent's *Comm.* p. 375). When such lineal descendants stand in unequal degrees of consanguinity the inheritance is *per stirpes* and not *per capita* (*In re Prote*, 1907; 104, N.Y. Supplement 581). This is the rule in practically all the states. But as in no two states or territories are the rules of descent identical, the only safe guides are the statutes and decisions of the particular state in which the land to be inherited is situated. The law of primogeniture as understood in England is generally abolished throughout the United States, and male and female relatives inherit equally. In some states, as in Massachusetts, relatives of the half-blood inherit equally with those of the whole-blood of the same degree; in others, like Maryland, they can inherit only in case none of whole-blood exist. In some of the states the English rule that natural children have no inheritable blood has been greatly modified. In Louisiana, if duly acknowledged, they may inherit from both father and mother in the absence of lawful issue. Degrees of kindred in the United States generally are computed according to the civil law, *i.e.* by adding together the number of degrees between each of the two persons whose relationship is to be ascertained and the common ancestor. Thus, relationship between two brothers is in the second degree; between uncle and nephew in the third degree; between cousins, in the fourth, &c.

In a few states such degrees are computed according to the common law, *i.e.* by counting from the common ancestor to the most remote descendant of the two from him—thus, brothers would be related in the first degree, uncle and nephew in the second, &c. In most states representation amongst collaterals is restricted—in some to the descendants of brothers and sisters, in others to their children only.

In some states, *e.g.* in California, Louisiana and Texas, the law of "community property" of husband and wife prevails. This is derived from the French and Spanish law existing in the territories out of which those states were formed, as the result of the conquest of Mexico by Spain and the colonizing of Louisiana by France. The foundation idea is an equal division at death of either party of all property acquired during their marriage except by gift, devise or descent. In general the husband has the control and management thereof during the marriage, and either survivor has the administration of the moiety of the one deceased. There is a conflict in the laws in such states as to the exact definition and as to whether or not the gains or profits of such property are to be deemed separate property or community property [Succession of Dielman (Louisiana, 1907), 43 Southern Rep. 972].

INHIBITION (from Lat. *inhibere*, to restrain, prevent), an act of restraint or prohibition, an English legal term, particularly used in ecclesiastical law, for a writ from a superior to an inferior court, suspending proceedings in a case under appeal, also for the suspension of a jurisdiction of a bishop's court on the visitation of an archbishop, and for that of an archdeacon on the visitation of a bishop. It is more particularly applied to a form of ecclesiastical *censure*, suspending an offending clergyman from the performance of any service of the Church, or other spiritual duty, for the purpose of enforcing obedience to a monition or order of the bishop or judge. Such inhibitions are at the discretion of the ordinary if he considers that scandal might arise from the performance of spiritual duties by the offender (Church Discipline Act 1860, re-enacted by the Clergy Discipline Act 1892, sect. 10). By the Sequestration Act 1871, sect. 5, similar powers of inhibition are given where a sequestration remains in force for more than six months, and also, by the Benefices Act 1898, in cases where a commission reports that the ecclesiastical duties of a benefice are inadequately performed through the negligence of the incumbent.

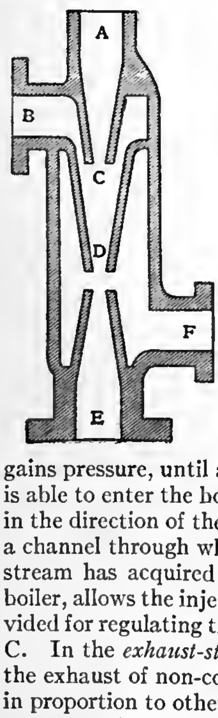
INISFAIL, a poetical name for Ireland. It is derived from *Faul* or *Lia-fail*, the celebrated stone, identified in Irish legend with the stone on which the patriarch Jacob slept when he dreamed of the heavenly ladder. The Lia-fail was supposed to have been brought to Ireland by the Dedannans and set up at Tara as the "inauguration stone" of the Irish kings; it was subsequently removed to Scone where it became the coronation stone of the Scottish kings, until it was taken by James VI. of Scotland to Westminster and placed under the coronation chair in the Abbey, where it has since remained. Inisfail was thus the island of the Fail, the island whose monarchs were crowned at Tara on the sacred inauguration stone.

INITIALS (Lat. *initialis*, of or belonging to a beginning, *initium*), the first letters of names. In legal and formal documents it is usually the practice in appending a signature to write the name in full. But this is by no means necessary, even in cases where a signature is expressly required by statute. It has been held that it is sufficient if a person affixes to a document the usual form in which he signs his name, with the intent that it shall be treated as his signature. So, signature by initials is a good signature within the Statute of Frauds (*Phillimore* v. *Barry*, 1818, 1 Camp. 513), and also under the Wills Act 1837 (*In re Blewitt*, 1880, 5 P.D. 116).

INITIATION (Lat. *initium*, beginning, entrance, from *inire*, to go in), the process of formally entering, and especially the rite of admission into, some office, or religious or secret society, &c. Among nearly all primitive races initiatory rites of a bloody character were and are common. The savage pays homage to strength, and the purpose of his initiatory rites is to test physical vigour, self-control and the power of enduring pain. Initiation is sometimes religious, sometimes social, but in primitive society it has always the same character. Thus, in Whydah (West Africa) the young girls consecrated to the worship of the serpent, "the brides of the Serpent," had figures of flowers and animals burnt into their skins with hot irons; while in the neighbouring Yorubaland the power of enduring a sound thrashing is the qualification for the throne. In no country was the practice of initiatory rites more general than in the Americas. The Colombian Indians compelled their would-be chief to submit to terrible tests. He had first to bear severe beatings without a murmur. Then, placed in a hammock with his hands tied, venomous ants were placed on his naked body. Finally a fire was lit beneath him. All this he had to bear without flinching. In ancient Mexico there were several orders of chivalry, entry into which was only permitted after brutal initiation. The nose of the candidate was pierced with an eagle's talon or a pointed bone, and he was expected to dig knives into his body. In Peru the young Inca princes had to fast and live for weeks without sleep. Among the North American Indians initiatory rites were universal. The Mandans held a feast at which the young "braves" supported the weight of their bodies on pieces of wood skewered through the muscles of shoulders, breasts and arms. With the Sioux, to become a medicine-man, it was necessary to submit to the ordeal known as "looking at the sun." The sufferer, nearly naked, was bound on the earth by cords passed through holes made in the pectoral muscles. With bow and arrow in hand, he lay in this position all day gazing at the sun. Around him his friends gathered to applaud his courage.

Religious brotherhoods of antiquity, too, were to be entered only after long and complicated initiation. But here the character of the ordeal is rather moral than physical. Such were the rites of admission to the Mysteries of Isis and Eleusis. Secret societies of all ages have been characterized by more or less elaborate initiation. That of the Femgerichte, the famous medieval German secret tribunal, took place at night in a cave, the neophyte kneeling and making oath of blind obedience. Imitations of such tests are perpetuated to-day in freemasonry; while the Mafia, the Camorra, the Clan-na-Gael, the Molly Maguires, the Ku-Klux Klan, are among more recent secret associations which have maintained the old idea of initiation.

INJECTOR (from Lat. *injicere*, to throw in), an appliance for supplying steam-boilers with water, and especially used with locomotive boilers. It was invented by the French engineer H. V. Giffard in 1858, and presents the paradox that by the pressure of the steam in the boiler, or even, as in the case of the exhaust steam injector, by steam at a much lower pressure, water is forced into the boiler against that pressure. A diagrammatic section illustrating its construction is shown in figure. Steam enters at A and blows through the annular orifice C, the size of which can be regulated by a valve not shown in the figure. The feed water flows in at B and meeting the steam at C causes it to condense. Hence a vacuum is produced at C, and consequently the water rushes in with great velocity and streams down the combining cone D, its velocity being augmented by the impact of steam on the back of the column. In the lower part of the nozzle E the stream expands; it therefore loses velocity and, by a well-known hydrodynamic principle, gains pressure, until at the bottom the pressure is so great that it is able to enter the boiler through a check valve which opens only in the direction of the stream. An overflow pipe F, by providing a channel through which steam and water may escape before the stream has acquired sufficient energy to force its way into the boiler, allows the injector to start into action. Means are also provided for regulating the amount of water admitted between D and C. In the *exhaust-steam* injector, which works with steam from the exhaust of non-condensing engines, the steam orifice is larger in proportion to other parts than in injectors working with boiler steam, and the steam supply more liberal. In *self-starting* injectors an arrangement is provided which permits free overflow until the injector starts into action, when the openings are automatically adjusted to suit delivery into the boiler.



INJUNCTION (from Lat. *injungere*, to fasten, or attach to, to lay a burden or charge on, to enjoin), a term meaning generally a command, and in English law the name for a judicial process whereby a party is required to refrain from doing a particular thing according to the exigency of the writ. Formerly it was a remedy peculiar to the court of chancery, and was one of the instruments by which the jurisdiction of that court was established in cases over which the courts of common law were entitled to exercise control. The court of chancery did not presume to interfere with the action of the courts, but, by directing an injunction to the person whom it wished to restrain from following a particular remedy at common law, it effected the same purpose indirectly. Under the present constitution of the judicature, the injunction is now equally available in all the divisions of the high court of justice, and it can no longer be used to prevent an action in any of them from proceeding in the ordinary course.

Although an injunction is properly a restraining order, there are instances in which, under the form of a prohibition, a positive order to do something is virtually expressed. Thus in a case of nuisance an injunction was obtained to restrain the defendant from preventing water from flowing in such regular quantities as it had ordinarily done before the day on which the nuisance commenced. But generally, if the relief prayed for is to compel something to be done, it cannot be obtained by injunction, although it may be expressed in the form of a prohibition—as in the case in which it was sought to prevent a person from discontinuing to keep a house as an inn. The injunction was used to stay proceedings in other courts "wherever a party by fraud, accident, mistake or otherwise had obtained an advantage in proceeding in a court of ordinary jurisdiction, which must necessarily make that court an instrument of injustice." As the injunction operates personally on the defendant, it may be used to prevent applications to foreign judicatures; but it is not used to prevent applications to parliament, or to the legislature of any foreign country, unless such applications be in breach of some agreement, and relate to matters of private interest. In so far as an injunction is used to prohibit acts, it may be founded either on an alleged contract or on a right independent of contract. The jurisdiction of the court to prevent breaches of contract has been described as supplemental to its power of compelling specific performance; *i.e.* if the court has power to compel a person to perform a contract, it will interfere to prevent him from doing anything in violation of it. But even when it is not within the power of the court to compel specific performance, it may interfere by injunction; thus, *e.g.* in the case of an agreement of a singer to perform at the plaintiff's theatre and at no other, the court, although it could not compel her to sing, could by injunction prevent her from singing elsewhere in breach of her agreement.

An injunction may as a general rule be obtained to prevent acts which are violations of legal rights, except when the same may be adequately remedied by an action for damages at law. Thus the court will interfere by injunction to prevent waste, or the destruction by a limited owner, such as a tenant for life, of things forming part of the inheritance. Injunctions may also be obtained to prevent the continuance of nuisances, public or private, the infringement of patents, copyrights and trade marks. Trespass might also in certain cases be prevented by injunction. Under the Common Law Procedure Act of 1854, and by other statutes in special cases, a limited power of injunction was conferred on the courts of common law. But the Judicature Act, by which all the superior courts of common law and chancery were consolidated, enacts that an injunction may be granted by an interlocutory order of the court in all cases in which it shall appear to be just or convenient; . . . and, if an injunction is asked either before or at or after the hearing of any cause or matter, to prevent any threatened or apprehended waste or trespass, such injunction may be granted whether the person against whom it is sought is or is not in possession under any claim of title or otherwise, or if not in possession does or does not claim to do the act sought to be restrained under colour of any title, and whether the estates claimed are legal or equitable.

An injunction obtained on interlocutory application during the progress of an action is superseded by the trial. It may be continued either provisionally or permanently. In the latter case the injunction is said to be perpetual. The distinction between "special" and "common" injunctions—the latter being obtained as of course—is now abolished in English law.

In the courts of the United States the writ of injunction remains purely an equitable remedy. It may be issued at the instance of the president to prevent any organized obstruction to inter-state commerce or to the passage of the mails (*in re* Debs, 158 United States Reports, 564). Temporary restraining orders may be issued, *ex parte*, pending an application for a temporary injunction. In the state courts temporary injunctions are often issued, *ex parte*, subject to the defendant's right to move immediately for their dissolution. Generally, however, notice of an application for a temporary injunction is required.

For the analogous practice in Scots law see INTERDICT.

INK (from Late Lat. *encaustum*, Gr. ἔγκαυστον, the purple ink used by Greek and Roman emperors, from ἐγκαίειν, to burn in), in its widest signification, a substance employed for producing graphic tracings, inscriptions, or impressions on paper or similar materials. The term includes two distinct conditions of pigment or colouring matter: the one fluid, and prepared for use with a pen or brush, as writing ink; the other a glutinous adhesive mass, printing ink, used for transferring to paper impressions from types, engraved plates and similar surfaces.

The ancient Egyptians prepared and used inks (Flinders Petrie discovered a papyrus bearing written characters as old as 2500 B.C.), and in China the invention of an ink is assigned to Tien-Tcheu, who lived between 2697 B.C. and 2597 B.C. These early inks were prepared from charcoal or soot mixed with gum, glue or varnish. Sepia (*q.v.*), the black pigment secreted by the cuttle-fish, was used as a writing fluid by the Romans. The iron-gall ink, *i.e.* an ink prepared from an iron salt and tannin, appears to have been first described by the monk Theophilus, who lived in the 11th century A.D., although Pliny, in the 1st century A.D., was acquainted with the blackening of paper containing green vitriol by immersion in an infusion of nut-galls. Iron-gall inks, prepared by mixing extracts of galls, barks, &c., with green vitriol, subsequently came into common use, and in the 16th century recipes for their preparation were given in domestic encyclopaedias. Their scientific investigation was first made by William Lewis in 1748. The earlier iron-inks were essentially a suspension of the pigment in water. In the early part of the 19th century the firm of Stephens introduced the first of the so-called blue-black inks under the name of "Stephens' writing fluid." Solutions of green vitriol and tannin, coloured by indigo and logwood, were prepared, which wrote with a blue tint and blackened on exposure, this change being due to the production of the pigment within the pores of the paper. The "alizarine" inks, patented by Leonhardi in 1856, are similar inks with the addition of a little madder. The application of aniline colours to ink manufacture in England dates from Croc's patent of 1861.

Writing Inks.—Writing inks are fluid substances which contain colouring matter either in solution or in suspension, and commonly partly in both conditions. They may be prepared in all shades of colour, and contain almost every pigment which can be dissolved or suspended in a suitable medium. The most important of all varieties is black ink, after which red and blue are most commonly employed. Apart from colour there are special qualities which recommend certain inks for limited applications, such as marking inks, ineradicable ink, sympathetic ink, &c. A good writing ink for ordinary purposes should continue limpid, and flow freely and uniformly from the pen; it should not throw down a thick sludgy deposit on exposure to the air; nor should a coating of mould form on its surface. It should yield distinctly legible characters immediately on writing, not fading with age; and the fluid ought to penetrate into the paper without spreading, so that the characters will neither wash out nor be readily removed by erasure. Further, it is desirable that ink should be non-poisonous, that it should as little as possible corrode steel pens, that characters traced in it should dry readily on the application of blotting paper without smearing, and that the writing should not present a glossy, varnished appearance.

Tannin Inks.—These inks are prepared from galls, or other sources of tannin, and a salt of iron, with the addition of some agglutinant in the case of the so-called oxidized inks, or a colouring matter in the case of unoxidized inks. Such mixtures form the staple black inks of commerce; they are essentially an insoluble iron gallate in extremely fine division held in suspension in water or a soluble compound dissolved in water.

On long exposure to air, as in inkstands, or otherwise, tannin inks gradually become thick and ropy, depositing a slimy sediment. This change on exposure is inevitable, resulting from the gradual oxidation of the ferrous compound, and it can only be retarded by permitting access of air to as small surfaces as possible. The inks also have a tendency to become mouldy, an evil which may be obviated by the use of a minute proportion of carbolic acid; or salicylic acid may be used.

The essential ingredients of ordinary black ink are—first, tannin-yielding bodies, for which Aleppo or Chinese galls are the most eligible materials; second, a salt of iron, ferrous sulphate (green vitriol) being alone employed; and third, a gummy or mucilaginous agent to keep in suspension the insoluble tinctorial matter of the ink. For ink-making the tannin has first to be transformed into gallic acid. In the case of Aleppo galls this change takes place by fermentation when the solution of the galls is exposed to the air, the tannin splitting up into gallic acid and sugar. Chinese galls do not contain the ferment necessary for inducing this change; and to induce the process yeast must be added to their solution. To prepare a solution of Aleppo galls for ink-making, the galls are coarsely powdered, and intimately mixed with chopped straw. This mixture is thrown into a narrow deep oak vat, provided with a perforated false bottom, and having a tap at the bottom for drawing off liquid. Over the mixture is poured lukewarm water, which, percolating down, extracts and carries with it the tannin of the galls. The solution is drawn off and repeatedly run through the mixture to extract the whole of the tannin, the water used being in such proportion to the galls as will produce as nearly as possible a solution having 5% of tannin. The object of using straw in the extraction process is to maintain the porosity of the mixture, as powdered galls treated alone become so slimy with mucilaginous extract that liquid fails to percolate the mass. For each litre of the 5% solution about 45 grammes of the iron salt are used, or about 100 parts of tannin for 90 parts of crystallized green vitriol. These ingredients when first mixed form a clear solution, but on their exposure to the air oxidation occurs, and an insoluble blue-black ferrosoferric gallate in extremely fine division, suspended in a coloured solution of ferrous gallate, is formed. To keep the insoluble portion suspended, a mucilaginous agent is employed, and those most available are gum senegal and gum arabic. An ink so prepared develops its intensity of colour only after some exposure; and after it has partly sunk into the paper it becomes oxidized there, and so mordanted into the fibre. As the first faintness of the characters is a disadvantage, it is a common practice to add some adventitious colouring matter to give immediate distinctness, and for that purpose either extract of logwood or a solution of indigo is used. When logwood extract is employed, a smaller proportion of extract of galls is required, logwood itself containing a large percentage of tannin. For making an unoxidized or blue-black ink indigo is dissolved in strong sulphuric acid, and the ferrous sulphate, instead of being used direct, is prepared by placing in this indigo solution a proper quantity of scrap iron. To free the solution from excess of uncombined acid, chalk or powdered limestone is added, whereby the free acid is fixed and a deposit of sulphate of lime formed. A solution so prepared, mixed with a tannin solution, yields a very limpid sea-green writing fluid, and as all the constituents remain in solution, no gum or other suspending medium is necessary. In consequence the ink flows freely, is easily dried and is free from the glossy appearance which arises through the use of gum.

China ink or *Indian ink* is the form in which ink was earliest prepared, and in which it is still used in China and Japan for writing with small brushes instead of pens. It is extensively used by architects, engineers and artists generally, and for various special uses. China ink is prepared in the form of sticks and cakes, which are rubbed down in water for use. It consists essentially of lamp-black in very fine condition, baked up with a glutinous substance; and the finer Oriental kinds are delicately perfumed. The following description of the manufacture as conducted in Japan is from a native source:—

"The body of the ink is soot obtained from pine wood or rosin, and lamp-black from sesamum oil for the finest sort. This is mixed with liquid glue made of ox-skin. This operation is effected in a large round copper bowl, formed of two spherical vessels, placed 1 in. apart, so that the space between can be filled up with hot water to prevent the glue from hardening during the time it is being mixed by hand with the lamp-black. The cakes are formed in wooden moulds, and dried between paper and ashes. Camphor, or a peculiar mixture of scents which comes from China, and a small quantity of carthamine (the red colouring substance of safflower), are added to the best kinds for improving the colour as well as for scenting the ink. There is a great difference both in price and in quality of the various kinds of ink, the finest article being rather costly."

It is said that the size used in Chinese kinds is of vegetable origin.

Logwood Ink.—Under the name of chrome ink a black ink was discovered by Runge, which held out the promise of cheapness combined with many excellent qualities. It is prepared by dissolving 15 parts of extract of logwood in 900 parts of water, to which 4 parts of crystallized sodium carbonate are added. A further solution of 1 part of potassium chromate (not bichromate) in 100 parts of water is prepared, and is added very gradually to the other solution with constant agitation. The ink so obtained possesses an intense blue-black colour, flows freely and dries readily, is neutral in reaction and hence does not corrode steel pens, and adheres to and sinks into paper so that manuscripts written with it may be freely washed with a sponge without danger of smearing or spreading. It forms a good copying ink, and it possesses all the qualities essential to the best ink; but on exposure to air it very readily undergoes decomposition, the colouring matter separating in broad flakes, which swim in a clear menstruum. It is affirmed by Viedt that this drawback may be overcome by the use of soda, a method first suggested by Böttger.

Logwood forms the principal ingredient in various other black inks used, especially as copying ink. A very strong decoction of logwood or a strong solution of the extract with ammonium-alum yields a violet ink which darkens slowly on exposure. Such an ink is costly, on account of the concentrated condition in which the logwood must be used. If, however, a metallic salt is introduced, a serviceable ink is obtained with the expenditure of much less logwood. Either sulphate of copper or sulphate of iron may be used, but the former, which produces a pleasing blue-black colour, is to be preferred. The following is the formula most highly recommended for this ink. A clear solution of 20 kilos of extract of logwood in 200 litres of water is obtained, to which is added, with agitation, 10 kilos of ammonium-alum dissolved in 20 litres of boiling water. The solution is acidified with 0·2 kilo of sulphuric acid, which has the effect of preventing any deposit, and finally there is added a solution of 1·5 kilos of sulphate of copper dissolved in 20 litres of water. This compound is exposed to the air for a few days to allow the colour to develop by oxidation, after which it is stored in well-corked bottles. The acid condition of this ink has a corrosive influence on steel pens; in all other respects it is a most valuable writing fluid.

Aniline Inks.—Solutions of aniline dye-stuffs in water are widely used as inks, especially coloured varieties. They are usually fugitive. Nigrosine is a black ink, which, although not producing a black so intense as common ink, possesses various advantages. Being perfectly neutral, it does not attack pens; it can easily be kept of a proper consistency by making up with water; and its colour is not injuriously affected by the action of acids. Its ready flow from stylographic pens led to the name "stylographic ink." Other aniline inks are mentioned below.

Copying Ink.—Ink which yields by means of pressure an impression, on a sheet of damped tissue paper, of characters written in it is called copying ink. Any ink soluble in water, or which retains a certain degree of solubility, may be used as copying ink. Runge's chrome ink, being a soluble compound, is, therefore, so available; and the other logwood inks as well as the ordinary ferrous gallate inks contain also soluble constituents, and are essentially soluble till they are oxidized in and on the paper after exposure to the air. To render these available as copying inks it is necessary to add to them a substance which will retard the oxidizing effect of the air for some time. For this purpose the bodies most serviceable are gum arabic or senegal, with glycerin, dextrin or sugar, which last, however, renders the ink sticky. These substances act by forming a kind of glaze or varnish over the surface of the ink which excludes the air. At the same time when the damp sheet of tissue paper is applied to the writing, they dissolve and allow a portion of the yet soluble ink to be absorbed by the moistened tissue. As copying ink has to yield two or more impressions, it is necessary that it should be made stronger, *i.e.* that it should contain more pigment or body than common ink. It, therefore, is prepared with from 30 to 40% less of water than non-copying kinds; but otherwise, except in the presence of the ingredients above mentioned, the inks are the same. Copying ink pencils consist of a base of graphite and kaolin impregnated with a very strong solution of an aniline colour, pressed into sticks and dried.

Red Ink.—The pigment most commonly employed as the basis of red ink is Brazil-wood. Such an ink is prepared by adding to a strong decoction of the wood a proportion of stannous chloride (tin spirits), and thickening the resulting fluid with gum arabic. In some instances alum and cream of tartar are used instead of the stannous chloride. Cochineal is also employed as the tinctorial basis of red ink; but, while the resulting fluid is much more brilliant than that obtained from Brazil-wood, it is not so permanent. A very brilliant red ink may be prepared by dissolving carmine in a solution of ammonia, but this preparation must be kept in closely stoppered bottles. A useful red ink may also be made by dissolving the rosein of Brook, Simpson and Spiller in water, in the proportion of 1 to from 150 to 200 parts.

Blue Ink.—For the production of blue ink the pigment principally used is Prussian blue. It is first digested for two or three days with either strong hydrochloric acid, sulphuric acid or nitric acid, the digested mass is next very largely diluted with water, and after settling the supernatant liquid is siphoned away from the sediment. This sediment is repeatedly washed, till all traces of iron and free acid disappear from the water used, after which it is dried and mixed with oxalic acid in the proportion of 8 parts of Prussian blue to 1 of the acid, and in this condition the material is ready for dissolving in water to the degree of colour intensity necessary. An aniline blue ink may be prepared by dissolving 1 part of bleu de Paris in from 200 to 250 parts of water.

Marking Ink.—The ink so called, used principally for marking linen, is composed of a salt of silver, usually the nitrate, dissolved in water and ammonia, with a little provisional colouring matter and gum for thickening. The colour resulting from the silver salt is developed by heat and light; and the stain it makes, although exceedingly obstinate, gradually becomes a faint brownish-yellow. The following yields a good marking ink. Equal parts of nitrate of silver and dry tartaric acid are triturated in a mortar, and treated with water, when a reaction takes place, resulting in the formation of tartrate of silver and the liberation of nitric acid. The acid is neutralized, and at the same time the silver tartrate is dissolved by the addition of ammonia, and this solution with colouring matter and gum forms the ink, which may be used with an ordinary steel pen.

Many vegetable juices, *e g.* of *Coriaria thymifolia, Semecarpus* *anacardium*, *Anacardium occidentale* (Cashew), are inks of this type.

Gold and *silver inks* are writing fluids in which gold and silver, or imitations of these metals, are suspended in a state of fine division. In place of gold, Dutch leaf or mosaic gold is frequently substituted, and bronze powders are used for preparing a similar kind of ink. The metallic foil is first carefully triturated into a fine paste with honey, after which it is boiled in water containing a little alkali, and then repeatedly washed in hot water and dried at a gentle heat. A solution is prepared consisting of 1 part of pure gum arabic and 1 part of soluble potash glass in 4 parts of distilled water, into which the requisite quantity of the metallic powder prepared is introduced. Owing to the superior covering nature of pure gold, less of the metal is required than is necessary in the case of silver and other foils. In general 1 part of foil to 3 or 4 parts of solution is sufficient. The metallic lustre of writing done with this solution may be greatly heightened by gently polishing with a burnishing point. Another gold ink depends upon the formation of purple of Cassius; the linen is mordanted with stannous chloride, and the gold applied as a gummy solution of the chloride.

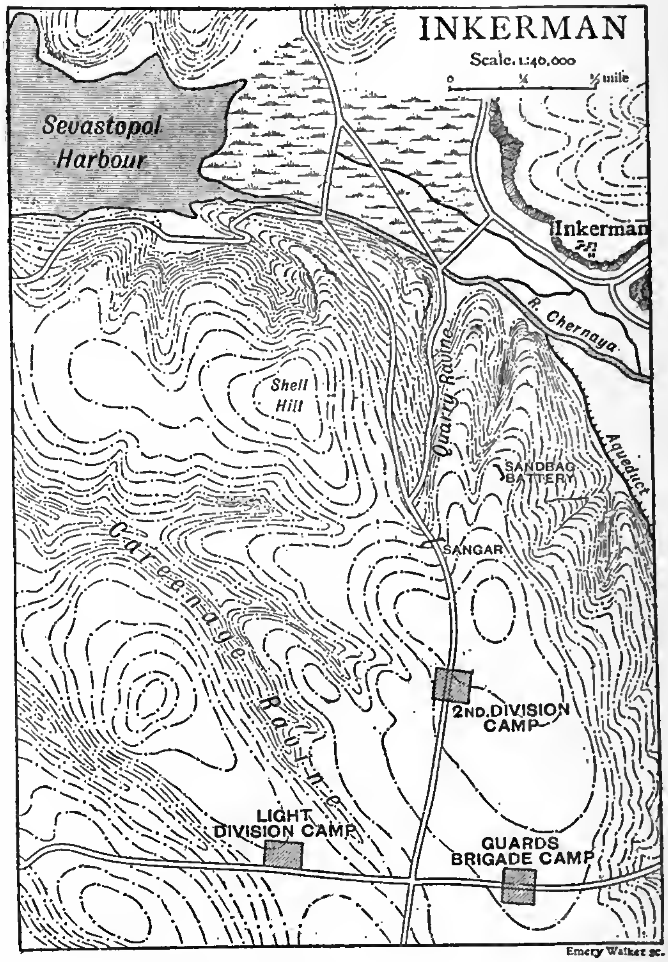
Indelible or *incorrodible ink* is the name given to various combinations of lamp-black or other carbonaceous material with resinous substances used for writing which is exposed to the weather or to the action of strong acids or alkaline solutions. An ink having great resisting powers may be conveniently prepared by rubbing down Indian ink in common ink till the mixture flows easily from the pen. Other combinations have more the character of coloured varnishes.

Sympathetic inks are preparations used for forming characters which only become visible on the application of heat or of some chemical reagent. Many chemicals which form in themselves colourless solutions, but which develop colour under the influence of reagents, may be used as sympathetic ink, but they are of little practical utility. Characters written in a weak solution of galls develop a dark colour on being treated with a solution of copperas; or, vice versa, the writing may be done in copperas and developed by the galls solution. Writing done in various preparations develops colour on heating which fades as the paper cools. Among such substances are solutions of the chlorides of cobalt and of nickel. Very dilute solutions of the mineral acids and of common salt and a solution of equal parts of sulphate of copper and sal-ammoniac act similarly. Writing with rice water and developing with iodine was a device much used during the Indian Mutiny.

Printing Inks.—Printing inks are essentially mixtures of a pigment and a varnish. The varnish is prepared from linseed oil, rosin and soap; the oil must be as old as possible; the rosin may be black or amber; and the soap, which is indispensable since it causes the ink to adhere uniformly to the type and also to leave the type clean after taking an impression, is yellow, or turpentine soap for dark inks, and curd soap for light inks. The varnish is prepared as follows: The oil is carefully heated until it " strings " properly, *i.e.* a drop removed from the vessel on a rod, when placed upon a plate and the rod drawn away, forms a thread about ½ in. long. The rosin is carefully and slowly added and the mixture well stirred. The soap is then stirred in. The ink is prepared by mixing the varnish with the pigment, and grinding the mass to impalpable fineness either in a levigating mill or by a stone and muller. For black ink, lamp-black mixed with a little indigo or Prussian blue is the pigment employed; for wood engravings it may be mixed with ivory black, and for copper plates with ivory or Frankfurt black; for lithographic reproductions Paris black is used. Red inks are made with carmine or cochineal; red lead is used in cheap inks, but it rapidly blackens. Blue inks are made with indigo or Prussian blue; yellow with lead chromate or yellow ochre; green is made by mixing yellow and blue; and purple by mixing red and blue.

See C. A. Mitchell and T. C. Hepworth, *Inks, their Composition and Manufacture* (1904); S. Lehner, *Ink Manufacture* (1902); A. F. Gouillon, *Encres et cirages* (1906); L. E. Andés, *Schreib-, Kopier- und andere Tinten* (1906).

INKERMAN, BATTLE OF, fought on the 5th of November 1854 between a portion of the Allied English and French army besieging Sevastopol and a Russian army under Prince Menshikov (see CRIMEAN WAR). This battle derives its name from a ruin on the northern bank of the river Tchernaya near its mouth, but it was fought some distance away, on a nameless ridge (styled Mount Inkerman after the event) between the Tchernaya and the Careenage Ravine, which latter marked the right of the siege-works directed against Sevastopol itself. Part of this ridge, called Home Ridge and culminating in a knoll, was occupied by the British, while farther to the south, facing the battleground of Balaklava, a corps under General Bosquet was posted to cover the rear of the besiegers against attacks from the direction of Traktir Bridge. The Russians arranged for a combined attack on



the ridge above-mentioned by part of Menshikov's army (16,000) and a corps (19,000) that was to issue from Sevastopol. This attack was to have, beside its own field artillery, the support of fifty-four heavy guns, and the Russian left wing on the Balaklava battleground was to keep Bosquet occupied. If successful, the attack on the ridge was to be the signal for a general attack all along the line. It was apparently intended by Menshikov that the column from the field army should attack the position from the north, and that the Sevastopol column should advance along the west side of the Careenage Ravine. But he only appointed a commander to take charge of both columns at the last moment, and the want of a clear understanding as to what was to be done militated against success from the first. General Soimonov, with the Sevastopol column, after assembling his troops before dawn on the 5th, led them on to the upland east of Careenage Ravine, while the field army column, under General Pavlov, crossed the Tchernaya near its mouth, almost at right angles to Soimonov's line of advance.

The British troops on or near the ground were the 2nd Division, 3000, encamped on the ridge; Codrington's brigade of the Light Division, 1400, on the slopes west of the Careenage Ravine; and the Guards' brigade, 1350, about $\frac{3}{4}$ m. in rear of the 2nd Division camp. No other forces, French or British, were within 2 m. except another part of Sir George Brown's Light Division. A mist overhung the field and the hillsides were slippery with mud. Soimonov, with his whole force deployed in a normal attack formation (three lines of battalion columns covered by a few hundred skirmishers) pushed forward along the ridge (6 A.M.) without waiting for Pavlov or for Dannenberg, the officer appointed to command the whole force. Shell Hill, guarded only by a picquet, was seized at once. The heavy guns that had been brought from the fortress were placed in position on this hill, and opened fire (7 A.M.) on the knoll, 1400 yds. to the S., behind which the 2nd Division was encamped. The Russian infantry halted for the guns to prepare the way, and the heavy projectiles both swept the crest of the British knoll and destroyed the camp in rear. But already General Pennefather, commanding the division, had pushed forward one body of his infantry after another down the forward slope, near the foot of which they encountered the Russians in great force. On his side, Soimonov had been compelled to break up his regular lines of columns at the narrowest part of the ridge and to push his battalions forward a few at a time. This and the broken character of the ground made the battle even in the beginning a mêlée. The obscurity of the mist, which had at first allowed the big battalions to approach unobserved, now favoured the weaker side. Soimonov himself, however, formed up some 9000 men, who drove back the British left wing—for the whole of Pennefather's force at the time was no more than 3600 men. But the right wing, not as yet attacked, either by Soimonov or by Pavlov, held on to its positions on the forward slope, and a column of Russian sailors and marines, who had been placed under Soimonov's command and had moved up the Careenage Ravine to turn the British left, were caught, just as they emerged on to the plateau in rear of Pennefather's line, between two bodies of British troops hurrying to the scene of action. On the front, too, the Russian attack came to a standstill and ebbed, for Soimonov's overcrowded battalions jostled one another and dissolved on the narrow and broken plateau. Soimonov himself was killed, and the disciplined confidence and steady volleys of the defenders dominated the chaotic *élan* of the Russians. Thus 3300 defenders were able to repulse and even to "expunge from the battlefield" the whole of the Sevastopol column, except that portion of it which drifted away to its left and joined Pavlov. This stage of the battle had lasted about forty minutes. But, brilliant as was this overture, it is the second stage of the battle that gives it its epic interest.

The first attack made by Pavlov's advanced guard, aided by parts of Soimonov's corps, was relatively slight, but General Dannenberg now arrived on the field, and arranged for an assault on the British centre and right, to be delivered by 10,000 men (half his intact forces) chiefly by way of the Quarry Ravine, the attack to be prepared by the guns on Shell Hill. Pennefather had been reinforced by the Guards' brigade and a few smaller units. Not the least extraordinary feature of the battle that followed is the part played by a sangar of stones at the head of Quarry Ravine and a small battery, called the Sandbag Battery, made as a temporary emplacement for two heavy guns a few days before. The guns had done their work and been sent back whence they came. Nevertheless these two insignificant works, as points to hold and lines to defend on an otherwise featureless battlefield, became the centres of gravity of the battle.

The sangar at first fell into the hands of the Russians, but they were soon ejected, and small British detachments reoccupied and held it, while the various Russian attacks flowed up and past it and ebbed back into the Quarry Ravine. Possession of the Sandbag Battery was far more fiercely contested. The right wing was defended by some 700 men of the 2nd Division, who were reinforced by 1300 of the Guards. The line of defence adjacent to the battery looked downhill for about 300 yds., giving a clear field of fire for the new Enfield rifle the English carried; but a sharp break in the slope beyond that range gave the assailants plenty of "dead ground" on which to form up. For a time, therefore, the battle was a series of attacks, delivered with great fierceness by the main body of Pavlov's corps, the repulse of each being followed by the disappearance of the assailants. But the arrival of part of the British 4th Division under Sir George Cathcart gave the impulse for a counter-attack. Most of the division indeed had to be used to patch up the weaker parts of the line, but Cathcart himself with about 400 men worked his way along the lower and steeper part of the eastern slope so as to take the assailants of the battery in flank. He had not proceeded far, however, when a body of Russians moving higher up descended upon the small British corps and scattered it, Cathcart himself being killed. Other counter-strokes that his arrival had inspired were at the same time made from different parts of the defensive front, and had the effect of breaking up what was a solid line into a number of disconnected bands, each fighting for its life in the midst of the enemy. The crest of the position was laid open and parts of the Russian right wing seized it. But they were flung back to the lower slopes of the Quarry Ravine by the leading French regiment sent by Bosquet. This regiment was quickly followed by others. The last great assault was delivered with more precision, if with less fury than the others, and had Dannenberg chosen to employ the 9000 bayonets of his reserve, who stood idle throughout the day, to support the 6000 half-spent troops who made the attack, it would probably have been successful.

As it was, supported by the heavy guns on Shell Hill, the assailants, though no longer more than slightly superior in numbers, carried not only the sangar, but part of the crest line of the allied position. But they were driven back into the Quarry Ravine, and, relieving the exhausted British, the French took up the defence along the edge of the ravine, which, though still not without severe fighting, they maintained till the close of the battle. Inkerman, however, was not a drawn battle. The allied field artillery, reinforced by two long 18-pr. guns of the British siege train and assisted by the bold advance of two French horse-artillery batteries which galloped down the forward slope and engaged the Russians at close range, gained the upper hand. Last of all, the dominant guns on Shell Hill thus silenced, the resolute advance of a handful of British infantry decided the day, and the Russians retreated. The final shots were fired about 1.30 P.M.

The total British force engaged was 8500, of whom 2357 were killed and wounded. The French lost 939 out of about 7000 who came on to the field, though not all these were engaged. The Russians are said to have lost 11,000 out of about 42,000 present. The percentage (27·7) of loss sustained by the British is sufficient evidence of the intensity of the conflict, and provides a convincing answer to certain writers who have represented the battle as chiefly a French affair. On the other hand, the reproaches addressed by some British writers to General Bosquet for not promptly supporting the troops at Inkerman with his whole strength are equally unjustifiable, for apparently Sir George Brown and Sir George Cathcart both declined his first offers of support, and he had Prince Gorchakov with at least 20,000 Russians in his own immediate front. He would therefore have risked the failure of his own mission in order to take part in a battle where his intervention was not, so far as he could tell, of vital importance. When Lord Raglan definitely asked him for support, he gave it willingly and eagerly, sending his troops up at the double, and it must be remembered that several British divisions took no part in the action for the same reason that actuated Bosquet. But, in spite of the seemingly inevitable controversies attendant on an "allied" battle, it is now generally admitted that, as a "soldiers' battle," Inkerman is scarcely to be surpassed in modern history.

INLAYING, a method of ornamentation, by incrusting or otherwise inserting in one material a substance or substances differing therefrom in colour or nature. The art is practised in the fabrication of furniture and artistic objects in all varieties of wood, metal, shell, ivory and coloured and hard stone, and in compound substances; and the combinations, styles and varieties of effect are exceedingly numerous. Several special classes of inlaying may be here enumerated and defined, details regarding most of which will be found under their separate headings. In the ornamental treatment of metal surfaces *Niello* decoration, applied to silver and gold, is an ancient and much-practised species of inlaying. It consists in filling up engraved designs with a composition of silver, copper, lead and sulphur incorporated by heat. The composition is black, and the finished work has the appearance of a drawing in black on a metallic plate. An art, analogous in effect, called *bidri*, from Bider in the Deccan, is practised in India. In bidri work the ground is an alloy of zinc, with small proportions of copper and lead, in which shallow patterns and devices are traced, and filled up with thin plates of silver. When the surface has been evened and smoothed, the bidri ground is stained a permanent black by a paste the chief ingredients of which are sal-ammoniac and nitre, leaving a pleasing contrast of bright metallic silver in a dead black ground. The inlaying of gold wire in iron or steel is known as DAMASCENING (*q.v.*). It has been very largely practised in Persia and India for the ornamentation of arms and armour, being known in the latter country as Kuft work or Kuftgari. In Kashmir, vessels of copper and brass are very effectively inlaid with tin—an art which, like many other decorative arts, appears to have originated in Persia. In the ornamental inlaying of metal surfaces the Japanese display the most extraordinary skill and perfection of workmanship. In the inlaying of their fine bronzes they use principally gold and silver, but for large articles and also for common cast hollow ware commoner metals and alloys are employed. In inlaying bronzes they generally hollow out and somewhat undercut the design, into which the ornamenting metal, usually in the form of wire, is laid and hammered over. Frequently the lacquer work of the Japanese is inlaid with mother-of-pearl and other substances, in the same manner as is practised in ornamenting lacquered papier-mâché among Western communities. The Japanese also practise the various methods of inlaying referred to under DAMASCENING. The term *Mosaic* (*q.v.*) is generally applied to inlaid work in hard stones, marble and glass, but the most important class of mosaics—those which consist of innumerable small separate pieces—do not properly come under the head of inlaying. Inlaid mosaics are those in which coloured designs are inserted in spaces cut in a solid ground or basis, such as the modern Florentine mosaic, which consists of thin veneers of precious coloured stones set in slabs of marble. The Taj Mahal at Agra is an example of inlaid mosaic in white marble, and the art, carried to that city by a French artist, is still practised by native workmen. *Pietra dura* is a fine variety of inlaid mosaic in which hard and expensive stones —agate, cornelian, amethyst and the like—are used in relief. Certain kinds of enamel might also be included among the varieties of inlaying. (See also MARQUETRY and BOMBAY FURNITURE.)

INMAN, HENRY (1801–1846), American artist, was born in Utica, New York, on the 20th of October 1801. Apprenticed to the painter John W. Jarvis at the age of fourteen, he left him after seven years and set up for himself, painting portraits, genre and landscape. He was one of the organizers of the National Academy of Design in New York and its first vice-president (from 1826 until 1832). As a portrait painter he was highly successful both in New York and Philadelphia, and going to England in 1844, he had for sitters the Lord Chancellor (Cottenham), the poet Wordsworth, Doctor Chalmers, Lord Macaulay and others. His American sitters included President Van Buren and Chief Justice Marshall. He died in New York City on the 17th of January 1846.

INN, a river of Europe, an important right bank tributary of the Danube. It rises at an elevation of 7800 ft., in a small lake under the Piz Longhino, in the Swiss canton of the Grisons. After flowing for a distance of 55 m., through the Engadine it leaves Swiss territory at Martinsbruck and enters Austria. It next plunges through the deep ravine of Finstermünz, and, continuing in the main a north-easterly direction, receives at Landeck the Rosanna. Hence its course becomes more rapid, until, after swirling through the narrow and romantic Oberinnthal, it enters the broader and pastoral Unterinnthal. It next passes Innsbruck and from Hall, a few miles lower down, begins to be navigable for barges. At Kufstein, down to which point it has still pursued a north-easterly direction, it breaks through the north Tirol limestone formation, and, now keeping a northerly course, enters at Rosenheim the Bavarian high plateau. Its bed is now broad, studded with islands and enclosed by high banks. Its chief tributaries on this last portion of its course are the Alz and the Salzach, and at Passau, 309 m. from its source, it joins the Danube, which river down to that point it equals in length and far exceeds in volume of water. Its rapid current does not permit of extensive navigation, but timber rafts are floated down from above Innsbruck.

See Greinz, *Eine Wanderung durch das Unterinntal* (Stuttgart, 1902).

INN and **INNKEEPER.** An inn is a house where travellers are fed and lodged for reward. A distinction has been drawn between tavern, inn and hotel, the tavern supplying food and drink, the hotel lodging, the inn both; but this is fanciful. "Hotel" now means "inn," and "inn" is often applied to a mere public-house, whilst "tavern" is less used. "Inn," still the legal and best, as it is the oldest, is a form of the word "in" or "within." This sense is retained in the case of the English legal societies still known as INNS OF COURT (*q.v.*). In the Bible "inn" means "lodging-place for the night." Hospitality has always been a sacred duty in the East. The pilgrim or the traveller claims it as a right. But some routes were crowded, as that from Bagdad to Babylon. On these, *khans* (in or near a town) and *caravanserais* (in waste places) were erected at the expense of the benevolent. They consisted of a square building surrounded by a high wall; on the roof there was a terrace and over the gateway a tower; inside, was a large court surrounded by compartments in which was some rude provision for the animals and baggage of the traveller as well as for himself. The latter purchased his own food where he chose, and had to "do for himself." In some such place Jesus was born. Tavern is mentioned once in Scripture (Acts xxviii. 15) where it is said the brethren from Rome met Paul at "the Three Taverns." This was a station on the Appian Way, referred to also in Cicero's *Letters* (*Ad Att.* ii. 12). So, in modern London, stations are called "Elephant and Castle," or "Bricklayers' Arms," from adjacent houses of entertainment. Among the Greeks inns and innkeepers were held in low repute. The houses were bad and those who kept them had a bad name. A self-respecting Greek entered them as seldom as possible; if he travelled he relied on the hospitality of friends. In Rome under the emperors something akin to the modern inn grew up. There is, however, scarcely any mention of such institutions in the capital as distinguished from mere wine-shops or eating-houses. Ambassadors were lodged in apartments at the expense of the state. But along the great roads that radiated from Rome there were inns. Horace's account of his journey to Brundisium (*Sat.* i. 5), that brilliant picture of contemporary travel, tells us of their existence, and the very name of the Three Taverns shows that there was sufficient custom to support a knot of these institutions at one place. Under the Roman law, the innkeeper was answerable for the property of his guests unless the damage was due to *damnum fatale* or *vis major*, in modern language the act of God or the king's enemies. He was also liable for damage done by his servant or his slave or other inhabitant of the house.

In the middle ages hospitality was still regarded as a duty, and provision for travellers was regularly made in the monasteries. People of rank were admitted to the house itself, others sought the guest-chamber, which sometimes stood (as at Battle Abbey) outside the precincts. It consisted of a hall, round which were sleeping-rooms, though the floor of the hall itself was often utilized. Again, hospitality was rarely denied at the castle or country house. The knight supped with his host at the daïs or upper part of the great hall, and retired with him into his own apartment. His followers, or the meaner strangers, sat lower down at meat, and after the tables had been removed stretched themselves to rest upon the floor. In desolate parts hospices were erected for the accommodation of pilgrims. Such existed in the Alps and on all the great roads to the Holy Land or to famous shrines, notably to that of Canterbury. The still impressive remains of the Travellers' Hospital at Maidstone, founded by Archbishop Boniface in 1260, give an idea of the extent of such places. The mention of Canterbury recalls two inns celebrated by Chaucer. The pilgrims started from the "Tabard" at Southwark under the charge of Harry Baily the host, and they put up at the "Checquers of the Hope," in Mercery Lane, Canterbury. It is easy to infer that, as time went on, the meagre hospitality of the monastery or the hospice was not sufficient for an increasing middle class, and that the want was met by the development of the mere ale-house into the inn. The "ale-house," to give it the old English name, was always in evidence, and even in pre-Reformation days was a favourite subject for the satirist. In Langland's *Piers the Plowman* and in Skelton's *Elynour Rummynge* we have contemporary pictures of ale-houses of the 14th and 16th centuries, but the Tabard is quite a modern inn, with a *table d'hôte* supper, a sign, a landlord ("right a mery man") and a reckoning!

It has been conjectured (Larwood and Hotten, *History of Signboards*, 1874) that the inn sign was taken or imitated from that displayed on the town houses or *inns* of noblemen and prelates. The innkeeper alone of tradesmen retains his individual sign. The inn shared with the tavern the long projecting pole garnished with branches. These poles had become of such inordinate length in London that in 1375 they were restricted to 7 ft. But the inn of those times was still a simple affair. In each room there were several beds, the price of which the prudent traveller inquired beforehand. Extortion was frequent, though it was forbidden by a statute of Edward III. The fare was simple; bread, meat and beer, with fish on Fridays. The tavern sentiment is strong in Elizabethan literature. The "Boar's Head" in Eastcheap is inseparably connected with Sir John Falstaff and Dame Quickly. "Shall I not take mine ease in mine Inn?" (1 Henry IV., Act iii. sc. 3) is well-nigh the most famous word of the famous knight. A passage in Holinshed's *Chronicle* (1587, i. 246) explains the inner meaning of this. He assures us that the inns of England are not as those of other lands. Abroad the guest is under the tyranny of the host, but in England your inn is as your own house; in your chamber you can do what you will, and the host is rather your servant than your master. The "Mermaid" in Bread Street is associated with the memory of many wits and poets—Raleigh, Shakespeare, Beaumont, Fletcher, Ben Jonson—who frequented it and praised it.

Shenstone's lines as to "the warmest welcome at an inn" vent a common but rather cheap cynicism. Doctor Johnson was a great frequenter of inns and was outspoken in praise and blame. In the time immediately preceding railways the inn, which was also a post-house where the public coach as well as that of the private traveller changed horses, was a place of much importance. We have it presented over and over again in the pages of Dickens. The "Maypole" in *Barnaby Rudge* may be singled out for mention; it survives at Chigwell, Essex, as the "King's Head."

The effect of railways was to multiply hotels in great centres and gradually increase their size till we have the huge structures so plentiful to-day. The bicycle and later the motor car, through the enormous traffic they caused on the country roads, have restored the old wayside inns to more than their former prosperity.

In Scotland a statute (1424) of James I. ordained inns for man and beast, with food and drink at reasonable prices, in each borough, and a subsequent act prohibited lodging in private houses in places where there were inns, under a penalty of 40s. But for centuries the Scots inn was a poor affair. The Clachan of Aberfoyle in *Rob Roy*, kept by the widow MacAlpine, was probably typical. In *St Ronan's Well* Scott gives the more pleasing picture of the Cleikum Inn, kept by the delightful Meg Dods, and mention should be made of St Mary's Cottage, with its hostess Tibby Shiels, the scene of one of the *Noctes Ambrosianae*, with memories not merely of Scott but of Christopher North and the Ettrick Shepherd. Burns had much to do with inns and taverns. If Poosie Nancie's, where the Jolly Beggars held wild revel, is long vanished, the Globe at Dumfries still exists, a fair sample of an inn of the period. As late as 1841 Dickens, writing to John Foster during his first visit to Scotland, describes the Highland inns as very poor affairs, "a mere knot of little outhouses" he says of one; and even in Queen Victoria's *Leaves from the Journal of Our Life in the Highlands* the inn is described as invariably small and unassuming. Thus the development of hotels in Scotland did not begin much before the middle of the 19th century.

In America the first hotel mentioned in New York is "Kriger's Tavern" about 1642, replaced in 1703 by the "King's Arms." When the town came to be English a proclamation was issued regulating the inns. Meals were not to cost more than 8d. or beer 2d. per quart.

Law Relating to Innkeepers.—Whether any special building is an inn is a question of fact. A temperance hotel is an inn, but a mere public-house is not. An innkeeper is bound to receive, lodge and feed travellers if he has accommodation, if they are able and willing to pay, and are not obviously objectionable. If he refuse he is liable at common law to indictment, or an action will lie against him at the suit of the would-be guest. Under the Army Act soldiers of all kinds may be billeted on the innkeeper, even beyond his power to provide in his own house; he must find accommodation for them elsewhere. An innkeeper must keep the goods and chattels of his guest in safety, unless they are destroyed by the act of God or the king's enemies. Under this last the king's rebellious subjects are not included. He is not liable for goods stolen or destroyed by the companion of the guest or through the guest's own negligence. There are two theories as to the origin of this common law liability of the innkeeper: (1) it was a survival of the liability of the common trader, or (2) specially imposed from the nature of his calling. Old English law held him to some extent suspect. The traveller amongst strangers seemed forlorn and unprotected, and conspiracy with thieves was dreaded. In modern times the landlord's responsibilities were cut down by the Innkeepers Liability Act 1863. He is not liable (save for horses and other live animals with their gear and carriages) to a greater extent than £30, unless the loss is caused by the default or neglect of himself or his servants, or the goods have been formally deposited with him. He must conspicuously exhibit a copy of the material parts of the act. The innkeeper may contract himself out of his common law obligation, and, apart from negligence, he is not liable for injury to the person or clothes of his guest. In return for these responsibilities the law gives him a lien over his guest's goods till his bill be paid. This is a particular and not a general lien. It attaches only to the special goods brought by the guest to the inn, and housed by the innkeeper with him. When several guests go together, the lien extends to all their goods. The innkeeper is only bound to take ordinary care of goods thus held, but he cannot use them or charge for their house-room. By the custom of London and Exeter, "when a horse eats out the price of his head," namely, when the cost of keep exceeds value, the host may have him as his own. By the Innkeepers Act 1878, if goods have been kept for six weeks they may be advertised and then sold after the interval of a month. Although an advertisement in a London paper is directed, this act (it would seem) applies to Scotland (J. A. Fleming, in Green's *Encyclopaedia of the Law of Scotland*, vi. 363). In that country the law is generally the same as in England, though it has been held that the innkeeper is not responsible for loss by accidental fire. Nor is his refusal to receive a guest a criminal offence. In the United States the common law follows that of England, though laws of the various states have diminished the liability of the innkeeper in much the same fashion as in England. Innkeepers as retailers of intoxicating liquors are subject to the provisions of the Licensing Laws.

English and Roman law are compared in Pymar's *Law of Innkeepers* (1892). For Scots law, see Bell's *Principles*. An American treatise is S. H. Wandell, *Law of Inns, Hotels and Boarding Houses* (1888). (F. Wa.)

INNERLEITHEN, a police burgh and health resort of Peeblesshire, Scotland, on Leithen Water, near its junction with the Tweed, 6½ m. S.E. of Peebles by the North British railway. Pop. (1901) 2181. In olden times it seems to have been known as Hornehuntersland, and to have been mentioned as early as 1159, when a son of Malcolm IV. (the Maiden) was drowned in a pool of the Tweed, close to Leithenfoot. Its chief industry is the manufacture of tweeds and fine yarns, which, together with the fame of its medicinal springs, brought the burgh into prominence towards the end of the 18th century. The spa, alleged to be the St Ronan's well of Scott's novel of that name, has a pump-room, baths, &c. The saline waters are useful in minor cases of dyspepsia and liver complaints. The town is flanked on the W. by the hill fort of Caerlee (400 ft. long) and on the E. by that of the Pirn (350 ft. long). Farther E., close to the village of Walkerburn, are Purvis Hill terraces, a remarkable series of earthen banks, from 50 ft. to more than 100 ft. wide, and with a length varying up to 900 ft., the origin and purpose of which are unknown. Traquair House, or Palace, on the right bank of the Tweed, is believed to be the oldest inhabited house in Scotland, the most ancient portion dating from the 10th century, and including a remnant of the castle. It was largely added to by Sir John Stewart, first earl of Traquair (d. 1659) and is a good example of the Scottish Baronial mansion with high-pitched roof and turreted angles. To the west of the house was the arbour which formed the "bush aboon Traquair" of the songs by Robert Crawford (d. 1733) and John Campbell Shairp, its site being indicated by a few birch trees. James Nicol (1769–1819), the poet, was minister of Traquair, and his son James Nicol (1810–1879), the geologist and professor of natural history in Aberdeen University, was born in the manse.

INNESS, GEORGE (1825–1894), American landscape painter, was born near Newburgh, N.Y., on the 1st of May 1825. Before he was five years of age his parents had moved to New York and afterwards to Newark, N.J., in which latter city his boyhood was passed. He would not "take education" at the town academy, nor was he a success as a greengrocer's boy. He had a strong bent towards art, and his parents finally placed him with a drawing-master named Barker. At sixteen he went to New York to study engraving, but soon returned to Newark, where he continued sketching and painting after his own initiative. In 1843 he was again in New York, and is said to have passed a month in Gignoux's studio. But he was too impetuous, too independent in thought, to accept teaching; and, besides, the knowledge of his teachers must have been limited. Practically he was self-taught, and always remained a student. In 1851 he went to Europe, and in Italy got his first glimpse of real art. He was there two years, and imbibed some traditions of the classic landscape. In 1854 he went to France, and there studied the Barbizon painters, whom he greatly admired, especially Daubigny and Rousseau. After his return to America he opened a studio in New York, then went to Medfield, Mass., where he resided for five years. A pastoral landscape near this town inspired the characteristic painting "The Medfield Meadows." Again he went abroad and spent six years in Europe. He came back to New York in 1876, and lived there, or near there, until the year of his death, which took place at Bridge of Allan on the 3rd of August 1894 while he was travelling in Scotland. He was a National Academician, a member of the Society of American Artists, and had received many honours at home and abroad. He was married twice, his son, George Inness (*b.* 1854), being also a painter. Inness was emphatically a man of temperament, of moods, enthusiasms, convictions. He was fond of speculation and experiment in metaphysics and religion, as in poetry and art. Swedenborgianism, symbolism, socialism, appealed to him as they might to a mystic or an idealist. He aspired to the perfect unities, and was impatient of structural foundations. This was his attitude towards painting. He sought the sentiment, the light, air, and colour of nature, but was put out by nature's forms. How to subordinate form without causing weakness was his problem, as it was Corot's. His early education gave him no great technical facility, so that he never was satisfied with his achievement. He worked over his pictures incessantly, retouching with paint, pencil, coal, ink—anything that would give the desired effect—yet never content with them. In his latter days it was almost impossible to get a picture away from him, and after his death his studio was found to be full of experimental canvases. He was a very uneven painter, and his experiments were not always successful. His was an original—a distinctly American—mind in art. Most of his American subjects were taken from New York state, New Jersey and New England. His point of view was his own. At his best he was often excellent in poetic sentiment, and superb in light, air and colour. He had several styles: at first he was somewhat grandiloquent in Roman scenes, but sombre in colour; then under French influence his brush grew looser, as in the "Grey Lowering Day"; finally he broke out in full colour and light, as in the "Niagara" and the last "Delaware Water-Gap." Some of his pictures are in American museums, but most of them are in private hands. (J. C. Van D.)

INNOCENT (Innocentius), the name of thirteen popes and one anti-pope.

Innocent I., pope from 402 to 417, was the son of Pope Anastasius I. It was during his papacy that the siege of Rome by Alaric (408) took place, when, according to a doubtful anecdote of Zosimus, the ravages of plague and famine were so frightful, and help seemed so far off, that papal permission was granted to sacrifice and pray to the heathen deities; the pope was, however, absent from Rome on a mission to Honorius at Ravenna at the time of the sack in 410. He lost no opportunity of maintaining and extending the authority of the Roman see as the ultimate resort for the settlement of all disputes; and his still extant communications to Victricius of Rouen, Exuperius of Toulouse, Alexander of Antioch and others, as well as his action on the appeal made to him by Chrysostom against Theophilus of Alexandria, show that opportunities of the kind were numerous and varied. He took a decided view on the Pelagian controversy, confirming the decisions of the synod of the province of proconsular Africa held in Carthage in 416, which had been sent to him. He wrote in the same year in a similar sense to the fathers of the Numidian synod of Mileve who, Augustine being one of their number, had addressed him. Among his letters are one to Jerome and another to John, bishop of Jerusalem, regarding annoyances to which the first named had been subjected by the Pelagians at Bethlehem. He died on the 12th of March 417, and in the Roman Church is commemorated as a confessor along with Saints Nazarius, Celsus and Victor, martyrs, on the 28th of July. His successor was Zosimus.

Innocent II. (Gregorio Paparesci dei Guidoni), pope from 1130 to 1143, was originally a Benedictine monk. His ability, pure life and political connexions raised him rapidly to power. Made cardinal deacon of Sant Angelo in Pescheria by Paschal II. he was employed in various diplomatic missions. Calixtus II. appointed him one of the ambassadors who made peace with the Empire and drew up the Concordat of Worms (1122), and in the following year, with his later enemy Cardinal Peter Pierleoni, he was papal legate in France. On the 13th of February 1130 Honorius II. died, and on that night a minority of the Sacred College elected Paparesci, who took the name of Innocent II. After a hasty consecration he was forced to take refuge with a friendly noble by the faction of Pierleoni, who was elected pope under the name of Anacletus II. by a majority of the cardinals. Declaring that the cardinals had been intimidated, Innocent refused to recognize their choice; by June, however, he was obliged to flee to France. Here his title was recognized by a synod called by Bernard of Clairvaux at Étampes. Similar action was taken in Germany by the synod of Würzburg. In January 1131 Innocent held a personal interview with King Henry I. of England at Chartres, and in March, at Liége, with the German King Lothair, whom he induced to undertake a campaign against Anacletus. The German army invaded Italy in August 1132, and occupied Rome, all except St Peter's church and the castle of St Angelo which held out against them. Lothair was crowned emperor at the Lateran in June 1133, and as a further reward Innocent gave him the territories of the Countess Mathilda as a fief, but refused to surrender the right of investiture. Left to himself Innocent again had to flee, this time to Pisa. Here he called a council which condemned Anacletus. A second expedition of Lothair expelled Roger of Sicily (to whom Anacletus had given the title of king in return for his support) from southern Italy, but a quarrel with Innocent prevented the emperor attacking Rome. At this crisis, in January 1138, Anacletus died, and a successor elected by his faction, as Victor IV., resigned after two months. The Lateran council of 1139 restored peace to the Church, excommunicating Roger of Sicily, against whom Innocent undertook an expedition which proved unsuccessful. In matters of doctrine the pope supported Bernard of Clairvaux in his prosecution of Abelard and Arnold of Brescia, whom he condemned as heretics. The remaining years of Innocent's life were taken up by a quarrel with the Roman commune, which had set up an independent senate, and one with King Louis VII. of France, about an appointment. France was threatened with the interdict, but before matters came to a head Innocent died on the 22nd of September 1143.

See Herzog-Hauck, *Realencyklopädie*, "Innocenz II.," with full references. Gregorovius, *History of Rome in the Middle Ages*, trans. by Hamilton (London, 1896), vol. iv. part ii. pp. 420-453. (P. Sm.)

Innocent III. (Lando da Sezza), antipope (1179–1180), sprang from a noble Lombard family. Opponents of Alexander III. tried to make him pope in September 1179. Alexander, however, bribed his partisans to give him up, and imprisoned him in the cloister of La Cava in January 1180.

Innocent III. (Lotario de' Conti di Segni), pope from 1198 to 1216, was the son of Trasimondo, count of Segni, and of Claricia, a Roman lady of the noble family of Scotti, and was born at Anagni about 1160. His early education he received at Rome, whence he went to the university of Paris and subsequently to that of Bologna. At Paris, where he attended the lectures of Peter of Corbeil, he laid the foundations of his profound knowledge of the scholastic philosophy; at Bologna he acquired an equally profound knowledge of the canon and civil law. Thus distinguished by birth, intellect and attainments, on his return to Rome he rose rapidly in the church. He at once became a canon of St Peter's; he was made subdeacon of the Roman Church by Gregory VIII.; and in 1190 his uncle, Pope Clement III., created him cardinal-deacon of Santi Sergio e Baccho. The election of Celestine III. in the following year withdrew Lotario for a while from the active work of the Curia, the new pope belonging to the family of the Orsini, who were at feud with the Scotti. Lotario, however, employed his leisure in writing several works: *Mysteriorum evangelicae legis ac sacramenti eucharistiae libri VI.*, *De contemtu mundi, sive de miseria humanae conditionis*, and *De quadrapartita specie nuptiarum*. Of these only the two first are extant; they are written in the scholastic style, a sea of quotations balanced and compared, and they witness at once to the writer's profound erudition and to the fact that his mind had not yet emancipated itself from the morbid tendencies characteristic of one aspect of medieval thought. Yet Lotario was destined to be above all things a man of action, and, though his activities to the end were inspired by impracticable ideals, they were in their effects intensely practical; and Innocent III. is remembered, not as a great theologian, but as a great ruler and man of affairs.

On the 8th of January 1198 Celestine III. died, and on the same day Lotario, though not even a priest, was unanimously elected pope by the assembled cardinals. He took the name of Innocent III. On the 21st of February he was ordained priest, and on the 22nd consecrated bishop. Innocent was but thirty-seven years old at this time, and the vigour of youth, guided by a master mind, was soon apparent in the policy of the papacy. His first acts were to restore the prestige of the Holy See in Italy, where it had been overshadowed by the power of the emperor Henry VI. As pope it was his object to shake off the imperial yoke, as an Italian prince to clear the land of the hated Germans. The circumstances of the time were highly favourable to him. The early death of Henry VI. (September 1197) had left Germany divided between rival candidates for the crown, Sicily torn by warring factions of native and German barons. It was, then, easy for Innocent to depose the imperial prefect in Rome itself and to oust the German feudatories who held the great Italian fiefs for the Empire. Spoleto fell; Perugia surrendered; Tuscany acknowledged the leadership of the pope; papal *rectores* once more governed the patrimony of St Peter. Finally, Henry's widow, Constance, in despair, acknowledged the pope as overlord of the two Sicilies, and on her death (November 27, 1198) appointed him guardian of her infant son Frederick. Thus in the first year of his pontificate Innocent had established himself as the protector of the Italian nation against foreign aggression, and had consolidated in the peninsula a secure basis on which to build up his world-power.

The effective assertion of this world-power is the characteristic feature of Innocent's pontificate. Other popes before him—from Gregory VII. onwards—had upheld the theory of the supremacy of the spiritual over the temporal authority, with various fortune; it was reserved for Innocent to make it a reality. The history of the processes by which he accomplished this is given elsewhere. Here it will suffice to deal with it in the broadest outline. In Germany his support of Otto IV. against Philip of Swabia, then of Philip against Otto and finally, after Philip's murder (June 21, 1208), of the young Frederick II. against Otto, effectually prevented the imperial power, during his pontificate, from again becoming a danger to that of the papacy in Italy. Concessions at the cost of the Empire in Italy were in every case the price of his support (see Germany: *History*). In his relations with the German emperors Innocent acted partly as pope, partly as an Italian prince; his victories over other and more distant potentates he won wholly in his spiritual capacity. Thus he forced the masterful Philip Augustus of France to put away Agnes of Meran and take back his Danish wife Ingeborg, whom he had wrongfully divorced; he compelled Peter of Aragon to forgo his intended marriage with Bianca of Navarre and ultimately (1204) to receive back his kingdom as a fief of the Holy See; he forced Alphonso IX. of Leon to put away his wife Berengaria of Castile, who was related to him within the prohibited degrees, though he pronounced their children legitimate. Sancho of Portugal was compelled to pay the tribute promised by his father to Rome, and Ladislaus of Poland to cease from infringing the rights of the church. Even the distant north felt the weight of Innocent's power, and the archbishop of Trondhjem was called to order for daring to remove the ban of excommunication from the repentant King Haakon IV., as an infringement of the exclusive right of the pope to impose or remove the ban of the church in the case of sovereigns. So widespread was the prestige of the pope that Kaloyan, prince of Bulgaria, hoping to strengthen himself against internal foes and the aggressions of the Eastern Empire, submitted to Rome and, in November 1204, received the insignia of royalty from the hands of the papal legates as the vassal of the Holy See.

Meanwhile Innocent had been zealous in promoting the crusade which ultimately, under the Doge Dandolo, led to the Latin occupation of Constantinople (see Crusades). This diversion from its original object was at first severely censured by Innocent; but an event which seemed to put an end to the schism of East and West came to wear a different aspect; he was the first pope to nominate a patriarch of Constantinople, and he expressed the hope that henceforth the church would be "one fold under one shepherd." By a bull of October 12, 1204, moreover, Innocent proclaimed the same indulgences for a crusade to Livonia as the Holy Land. The result was the "conversion" of the Livonians (1206) and the Letts (1208) by the crusaders headed by the knights of the Teutonic Order. The organization of the new provinces thus won for the church

Innocent kept in his own hands, instituting the new archbishopric of Riga and defining the respective jurisdictions of the archbishops and the Teutonic Knights, a process which, owing to the ignorance at Rome of the local geography, led to curious confusion.

Another crusade, horrible in its incidents and momentous in its consequences, was that proclaimed by Innocent in 1207 against the Albigenses. In this connexion all that can be said in his favour is that he acted from supreme conviction; that the heresies against which he appealed to the sword were really subversive of Christian civilization; and that he did not use force until for ten years he had tried all the arts of persuasion in vain (see ALBIGENSES).

Of all Innocent's triumphs, however, the greatest was his victory over King John of England. The quarrel between the pope and the English king arose out of a dispute as to the election to the vacant see of Canterbury, which Innocent had settled by nominating Stephen Langton over the heads of both candidates. John refusing to submit, Innocent imposed an interdict on the kingdom and threatened him with a crusade; and, to avert a worse fate, the English king not only consented to recognize Langton but also to hold England and Ireland as fiefs of the Holy See, subject to an annual tribute (May 1213). The submission was no idle form; for years the pope virtually ruled England through his legates (see ENGLISH HISTORY and JOHN, king of England). So great had the secular power of the papacy become that a Byzantine visitor to Rome declared Innocent to be "the successor not of Peter but of Constantine."

As in the affairs of the world at large, so also in those of the church itself, Innocent's authority exceeded that of all his predecessors. Under him the centralization of the ecclesiastical administration at Rome received a great impulse, and the independent jurisdiction of metropolitans and bishops was greatly curtailed. In carrying out this policy his unrivalled knowledge of the canon law gave him a great advantage. To his desire to organize the discipline of the church was due the most questionable of his expedients: the introduction of the system of provisions and reservations, by which he sought to bring the patronage of sees and benefices into his own hands—a system which led later to intolerable abuses.

The year before Innocent's death the twelfth ecumenical council assembled at the Lateran under his presidency. It was a wonderful proof at once of the world-power of the pope and of his undisputed personal ascendancy. It was attended by the plenipotentiaries of the emperor, of kings and of princes, and by some 1500 archbishops, bishops, abbots and other dignitaries. The business before it, the disciplining of heretics and Jews, and the proclamation of a new crusade, &c., vitally concerned the states represented; yet there was virtually no debate and the function of the great assembly was little more than to listen to and endorse the decretals read by the pope (see LATERAN COUNCILS). Shortly after this crowning exhibition of his power the great pope died on the 16th of July 1216.

Innocent III. is one of the greatest historical figures, both in the grandeur of his aims and the force of character which brought him so near to their realization. An appreciation of his work and personality will be found in the article PAPACY; here it will suffice to say that, whatever judgment posterity may have passed on his aims, opinion is united as to the purity of the motives that inspired them and the tireless self-devotion with which they were pursued. "I have no leisure," Innocent once sighed, "to meditate on supermundane things; scarce I can breathe. Yea, so much must I live for others, that almost I am a stranger to myself." Yet he preached frequently, both at Rome and on his journeys—many of his sermons, inspired by a high moral earnestness, have come down to us—and, towards the end of his life, he found time to write a pious exposition of the Psalms. His views on the papal supremacy are best explained in his own words. Writing to the patriarch of Constantinople (*Inn. III., lib.* ii. *ep.* 200) he says: "The Lord left to Peter the governance not of the church only but of the whole world;" and again in his letter to King John of England (*lib.* xvi. *ep.* 131): "The King of Kings . . . so established the kingship and the priesthood in the church, that the kingship should be priestly, and the priesthood royal (*ut sacerdotale sit regnum et sacerdotium sit regale*), as is evident from the epistle of Peter and the law of Moses, setting one over all, whom he appointed his vicar on earth." In his answer to the ambassadors of Philip Augustus he states the premises from which this stupendous claim is logically developed:—

"To princes power is given on earth, but to priests it is attributed also in heaven; to the former only over bodies, to the latter also over souls. Whence it follows that by so much as the soul is superior to the body, the priesthood is superior to the kingship. . . . Single rulers have single provinces, and single kings single kingdoms; but Peter, as in the plenitude, so in the extent of his power is pre-eminent over all, since he is the Vicar of Him whose is the earth and the fullness thereof, the whole wide world and all that dwell therein."

To the emperor of Constantinople, who quoted 1 Peter ii. 13, 14, to the contrary, he replied in perfect good faith that the apostle's admonition to obey "the king as supreme was addressed to lay folk and not to the clergy." The more intelligent laymen of the time were not convinced even when coerced. Even so pious a Catholic as the minnesinger Walther von der Vogelweide, giving voice to the indignation of German laymen, ascribed Innocent's claims, not to soundness of his scholastic logic, but to the fact that he was "too young" (*owê der babest ist ze junc*).

The literature on Innocent III. is very extensive; a carefully analysed bibliography will be found in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1901) *s.* "Innocenz III." In A. Potthast, *Bibliotheca hist. med. aevi* (2nd ed., Berlin, 1896), p. 650, is a bibliography of the literature on Innocent's writings. In the *Corpus juris canonici*, ed. Aemilius Friedberg (Leipzig, 1881), vol. ii., pp. xiv.-xvii., are lists of the official documents of Innocent III. excerpted in the *Decretales Gregorii IX.* The most important later works on Innocent III. are Achille Luchaire's *Innocent III, Rome et l'Italie* (Paris, 1904), *Innocent III, la croisade des Albigeois* (*ib.* 1905), *Innocent III, la papauté et l'empire* (*ib.* 1906), *Innocent III, la question d'orient* (*ib.* 1906); *Innocent III, les royautés vassales du Saint-Siège* (*ib.* 1908); and *Innocent III, la concile de latran et la réforme de l'eglise* (1908); *Innocent the Great*, by C. H. C. Pirie-Gordon (London, 1907); is the only English monograph on this pope and contains some useful documents, but is otherwise of little value. See also H. H. Milman, *History of Latin Christianity*, vol. v.; F. Gregorovius, *Rome in the Middle Ages*, translated by A. Hamilton (1896), vol. v. pp. 5-110; J. C. L. Gieseler, *Ecclesiastical Hist.*, translated by J. W. Hull, vol. iii. (Edinburgh, 1853), which contains numerous excerpts from his letters, &c. Innocent's works are found in Migne, *Patrologiae Cursus Completus, Series Latina*, vols. ccxiv.-ccxvii. For a translation of Innocent's answer to King John on the interdict, and John's surrender of England and Ireland to Innocent, see Gee and Hardy, *Documents illustrative of Church History* (London, 1896), pp. 73 et seq. (W. A. P.)

INNOCENT IV. (Sinibaldo Fiesco), pope 1243–1254, belonged to the noble Genoese family of the counts of Lavagna. Born at Genoa, he was educated under the care of his uncle Opizo, bishop of Parma. After taking orders at Parma, when he was made canon of the cathedral, he studied jurisprudence at Bologna. His first recorded appearance in political affairs was in 1218–1219, when he was associated with Cardinal Hugolinus (afterwards Gregory IX.) in negotiating a peace between Genoa and Pisa. This led to his rapid promotion. In 1223 Pope Honorius III. gave him a benefice in Parma, and in 1226 he was established at the curia as *auditor contradictarum literarum* of the pope, a post he held also under Gregory IX., until promoted (1227) to be vice-chancellor of the Roman Church. In September of the same year he was created cardinal priest of San Lorenzo in Lucina. He was papal *rector* (governor) of the March of Ancona from 1235 to 1240. On the 25th of June 1243 he was elected pope by the cardinals assembled at Anagni.

Innocent was raised to the Holy See when it was at deadly feud with the emperor Frederick II., who lay under excommunication. Frederick at first greeted the elevation of a member of an imperialist family with joy; but it was soon clear that Innocent intended to carry on the traditions of his predecessors. Embassies and courtesies were, indeed, interchanged, and on the 31st of March 1244 a treaty was signed at Rome, whereby the emperor undertook to satisfy the pope's claims in return for his own absolution from the ban. Neither side, however, was prepared to take the first steps to carry out the agreement, and Innocent, who had ventured back to Rome, began to feel unsafe in the city, where the imperial partisans had the ascendancy. Fearing a plan to kidnap him, he left Rome, ostensibly to meet the emperor, and from Sutri fled by night on horseback, pursued by 300 of the emperor's cavalry, to Civitavecchia, whence he took ship for Genoa and thence proceeded across the Alps to Lyons, at that time a merely nominal dependence of the Empire. Thence he wrote to the French king, Louis IX., asking for an asylum in France; but this Louis cautiously refused. Innocent, therefore, remained at Lyons, whence he issued a summons to a general council, before which he cited Frederick to appear in person, or by deputy. The council, which met on the 5th of June 1245, was attended only by those prepared to support the pope's cause; and though Frederick condescended to be represented by his justiciar, Thaddeus of Suessa, the judgment was a foregone conclusion. On the 17th of July Innocent formally renewed the sentence of excommunication on the emperor, and declared him deposed from the imperial throne and that of Naples. Frederick retorted by announcing his intention of reducing "the clergy, especially the highest, to a state of apostolic poverty," and by ordaining the severest punishments for those priests who should obey the papal sentence. Innocent thereupon proclaimed a crusade against the emperor and armed his ubiquitous agents, the Franciscan and Dominican friars, with special indulgences for all those who should take up the cross against the imperial heretic. At the same time he did all in his power to undermine Frederick's authority in Germany and Italy. In Naples he fomented a conspiracy among the feudal lords, who were discontented with the centralized government established under the auspices of Frederick's chancellor, Piero della Vigna. In Germany, at his instigation, the archbishops with a few of the secular nobles in 1246 elected Henry Raspe, landgrave of Thuringia, German king; but the "priests' king," as he was contemptuously called, died in the following year, William II., count of Holland, being after some delay elected by the papal party in his stead.

Innocent's relentless war against Frederick was not supported by the lay opinion of his time. In Germany, where it wrought havoc and misery, it increased the already bitter resentment against the priests. From England the pope's legate was driven by threats of personal violence. In France not even the saintly King Louis IX., who made several vain attempts to mediate, approved the pope's attitude; and the failure of the crusade which, in 1248, he led against the Mussulmans in Egypt, was, with reason, ascribed to the deflection of money and arms from this purpose to the war against the emperor. Even the clergy were by no means altogether on Innocent's side; the council of Lyons was attended by but 150 bishops, mainly French and Spanish, and the deputation from England, headed by Robert Grossetête of Lincoln and Roger Bigod, came mainly in order to obtain the canonization of Edmund of Canterbury and to protest against papal exactions. Yet, for better or for worse, Innocent triumphed. His financial position was from the outset strong, for not only had he the revenue from the accustomed papal dues but he had also the support of the powerful religious orders; *e.g.* in November 1245 he visited the abbey of Cluny and was presented by the abbot with gifts, the value of which surprised even the papal officials. At first the war went in Frederick's favour; then came the capture of the strategically important city of Parma by papal partisans (June 16th, 1247). From this moment fortune changed. On the 18th of February 1248 Frederick's camp before Parma (the temporary town of Vittoria) was taken and sacked, the imperial insignia—of vast significance in those days—being captured. From this blow the emperor never recovered; and when on the 13th of December 1250 he died Innocent greeted the news by quoting from Psalm xcvi. 11, "Let the heavens rejoice and let the earth be glad."

On the 19th of April 1251 Innocent left Lyons, which had suffered severely from his presence, and returned to Italy. He continued the struggle vigorously with Frederick's son and successor, Conrad IV., who in 1252 descended into Italy, reduced the rebellious cities and claimed the imperial crown. Innocent, determined that the Hohenstaufen should not again dominate Italy, offered the crown of Sicily in turn to Richard of Cornwall, Charles of Anjou, and Henry III. of England, the last of whom accepted the doubtful gift for his son Edmund. Even after Conrad's capture of Naples Innocent remained inexorable; for he feared that Rome itself might fall into the hands of the German king. But fortune favoured him. On the 20th of May 1254 Conrad died, leaving his infant son Conradin, as Henry VI. had left Frederick II., under the pope's guardianship. Innocent accepted the charge and posed as the champion of the infant king. He held, indeed, to his bargain with Henry III. and, with all too characteristic nepotism, exercised his rights over the Sicilian kingdom by nominating his own relations to its most important offices. Finally, when Manfred, who by Frederick's will had been charged with the government of the two Sicilies, felt obliged to acknowledge the pope's suzerainty, Innocent threw off the mask, ignored Conradin's claims, and on the 24th of October formally asserted his own claims to Calabria and Sicily. He entered Naples on the 27th; but meanwhile Manfred had fled and had raised a considerable force; and the news of his initial successes against the papal troops reached Innocent as he lay sick and hastened his end. He died on the 7th of December 1254.

Innocent IV. is comparable to his greater predecessor Innocent III. mainly in the extreme assertion of the papal claims. "The emperor," he wrote, "doubts and denies that all men and all things are subject to the See of Rome. As if we who are judges of angels are not to give sentence on earthly things. . . . The ignorant assert that Constantine first gave temporal power to the See of Rome; it was already bestowed by Christ Himself, the true King and Priest, as inalienable from its nature and absolutely unconditional. Christ established not only a pontifical but a royal sovereignty (*principatus*) and committed to blessed Peter and his successors the empire both of earth and heaven, as is sufficiently proved by the plurality of the keys" (*Codex epist. Vatic.* No. 4957, 49, quoted in Raumer, *Hohenstaufen*, iv. 78). But this language, which in the mouth of Innocent III. had been consecrated by the greatness of his character and aims, was less impressive when it served as a cloak for an unlimited personal ambition and a family pride which displayed itself in unblushing nepotism. Yet in some respects Innocent IV. carried on the high traditions of his great predecessors. Thus he admonished Sancho II. of Portugal to turn from his evil courses and, when the king disobeyed, absolved the Portuguese from their allegiance, bestowing the crown on his brother Alphonso. He also established an ecclesiastical organization in the newly converted provinces of Prussia, which he divided into four dioceses; but his attempt to govern the Baltic countries through a legate broke on the opposition of the Teutonic Order, whose rights in Prussia he had confirmed.

It was Innocent IV. who, at the council of Lyons, first bestowed the red hat on the Roman cardinals, as a symbol of their readiness to shed their blood in the cause of the church.

Innocent was a canon lawyer of some eminence. His small work *De exceptionibus* was probably written before he became pope; but the *Apparatus in quinque libros decretalium*, which displays both practical sense and a remarkable mastery of the available materials, was written at Lyons immediately after the council. His *Apologeticus*, a defence of the papal claims against the Empire, written—as is supposed—in refutation of Piero della Vigna's argument in favour of the independence of the Empire, has been lost. Innocent was also a notable patron of learning; he encouraged Alexander of Hales to write his *Summa universae theologiae*, did much for the universities, notably the Sorbonne, and founded law schools at Rome and Piacenza.

Innocent's letters, the chief source for his life, are collected by E. Berger in *Les Registres d'Innocent IV* (3 vols., Paris, 1884–1887). For English readers the account in Milman's *Latin Christianity*, vol. vi. (3rd ed., 1864) is still useful. Full references will be found in Herzog-Hauck, *Realencyklopädie*, vol. ix. (1901). (W. A. P.)

INNOCENT V. (Pierre de Champagni or de Tarentaise), pope from the 21st of January to the 22nd of June 1276, was born about 1225 in Savoy and entered the Dominican order at an early age. He studied theology under Thomas Aquinas, Albertus Magnus and Bonaventura, and in 1262 was elected provincial of his order in France. He was made archbishop of Lyons in 1271; cardinal-bishop of Ostia and Velletri, and grand penitentiary in 1275; and, partly through the influence of Charles of Anjou, was elected to succeed Gregory X. As pope he established peace between the republics of Lucca and Pisa, and confirmed Charles of Anjou in his office of imperial vicar of Tuscany. He was seeking to carry out the Lyons agreement with the Eastern Church when he died. His successor was Adrian V. Innocent V., before he became pope, prepared, in conjunction with Albertus Magnus and Thomas Aquinas, a rule of studies for his order, which was accepted in June 1259. He was the author of several works in philosophy, theology and canon law, including commentaries on the Scriptures and on the Sentences of Peter Lombard, and is sometimes referred to as *famosissimus doctor*. He preached the funeral sermon at Lyons over St Bonaventura. His bulls are in the Turin collection (1859).

Bourgeois, *Le Bienheureux Innocent V* (Paris, 1899); J. E. Borel, *Notice biogr. sur Pierre de Tarentaise* (Chambéry, 1890); P. J. Béthaz, *Pierre des Cours de la Salle, pape sous le nom Innocent V* (Augustae, 1891); L. Carboni, *De Innocentio V. Romano pontifice* (1894). (C. H. Ha.)

INNOCENT VI. (Étienne Aubert), pope from the 18th of December 1352 to the 12th of September 1362, was born at Mons in Limousin. He became professor of civil law at Toulouse and subsequently chief judge of the city. Having taken orders, he was raised to the see of Noyon and translated in 1340 to that of Clermont. In 1342 he was made cardinal-priest of Sti Giovanni e Paolo, and ten years later cardinal-bishop of Ostia and Velletri, grand penitentiary, and administrator of the bishopric of Avignon. On the death of Clement VI., the cardinals made a solemn agreement imposing obligations, mainly in favour of the college as a whole, on whichever of their number should be elected pope. Aubert was one of the minority who signed the agreement with the reservation that in so doing he would not violate any law, and was elected pope on this understanding; not long after his accession he declared the agreement null and void, as infringing the divinely-bestowed power of the papacy. Innocent was one of the best Avignon popes and filled with reforming zeal; he revoked the reservations and commendations of his predecessor and prohibited pluralities; urged upon the higher clergy the duty of residence in their sees, and diminished the luxury of the papal court. Largely through the influence of Petrarch, whom he called to Avignon, he released Cola di Rienzo, who had been sent a prisoner in August 1352 from Prague to Avignon, and used the latter to assist Cardinal Albornoz, vicar-general of the States of the Church, in tranquillizing Italy and restoring the papal power at Rome. Innocent caused Charles IV. to be crowned emperor at Rome in 1355, but protested against the famous "Golden Bull" of the following year, which prohibited papal interference in German royal elections. He renewed the ban against Peter the Cruel of Castile, and interfered in vain against Peter IV. of Aragon. He made peace between Venice and Genoa, and in 1360 arranged the treaty of Bretigny between France and England. In the last years of his pontificate he was busied with preparations for a crusade and for the reunion of Christendom, and sent to Constantinople the celebrated Carmelite monk, Peter Thomas, to negotiate with the claimants to the Greek throne. He instituted in 1354 the festival of the Holy Lance. Innocent was a strong and earnest man of monastic temperament, but not altogether free from nepotism. He was succeeded by Urban V.

The chief sources for the life of Innocent VI. are in Baluzius, *Vitae Pap. Avenion.* vol. i. (Paris, 1693); *Magnum bullarium Romanum*, vol. iv. (Turin, 1859); E. Werunsky, *Excerpta ex registris Clementis VI. et Innocentii VI.* (Innsbruck, 1885). See also L. Pastor, *History of the Popes*, vol. i, trans. by F. I. Antrobus (London, 1899); F. Gregorovius, *Rome in the Middle Ages*, vol. 6, trans. by Mrs G. W. Hamilton (London, 1900–1902); D. Cerri, *Innocenzo Papa VI* (Turin, 1873); J. B. Christophe, *Histoire de la papauté pendant le XIVe siècle*, vol. 2 (Paris, 1853); M. Souchon, *Die Papstwahlen* (Brunswick, 1888); G. Daumet, *Innocent VI et Blanche de Bourbon* (Paris, 1899); E. Werunsky, *Gesch. Kaiser Karls IV.* (Innsbruck, 1892). There is an excellent article by M. Naumann in Hauck's *Realencyklopädie*, 3rd ed. (C. H. Ha.)

INNOCENT VII. (Cosimo dei Migliorati), pope from the 17th of October 1404 to the 6th of November 1406, was born of middle-class parentage at Sulmona in the Abruzzi in 1339. On account of his knowledge of civil and canon law, he was made papal vice-chamberlain and archbishop of Ravenna by Urban VI., and appointed by Boniface IX. cardinal priest of Sta Croce in Gerusalemme, bishop of Bologna, and papal legate to England. He was unanimously chosen to succeed Boniface, after each of the cardinals had solemnly bound himself to employ all lawful means for the restoration of the church's unity in the event of his election, and even, if necessary, to resign the papal dignity. The election was opposed at Rome by a considerable party, but peace was maintained by the aid of Ladislaus of Naples, in return for which Innocent made a promise, inconsistent with his previous oath, not to come to terms with the antipope Benedict XIII., except on condition that he should recognize the claims of Ladislaus to Naples. Innocent issued at the close of 1404 a summons for a general council to heal the schism, and it was not the pope's fault that the council never assembled, for the Romans rose in arms to secure an extension of their liberties, and finally maddened by the murder of some of their leaders by the pope's nephew, Ludovico dei Migliorati, they compelled Innocent to take refuge at Viterbo (6th of August 1405). The Romans, recognizing later the pope's innocence of the outrage, made their submission to him in January 1406. He returned to Rome in March, and, by bull of the 1st of September, restored the city's decayed university. Innocent was extolled by contemporaries as a lover of peace and honesty, but he was without energy, guilty of nepotism, and showed no favour to the proposal that he as well as the antipope should resign. He died on the 6th of November 1406 and was succeeded by Gregory XII.

INNOCENT VIII. (Giovanni Battista Cibo), pope from the 29th of August 1484 to the 25th of July 1492, successor of Sixtus IV., was born at Genoa (1432), the son of Arano Cibo, who under Calixtus III. had been a senator of Rome. His youth, spent at the Neapolitan court, was far from blameless, and it is not certain that he was married to the mother of his numerous family. He later took orders, and, through the favour of Cardinal Calandrini, half-brother of Nicholas V., obtained from Paul II. the bishopric of Savona. Sixtus IV. translated him to the see of Molfetta, and in 1473 created him cardinal-priest of Sta Balbina, subsequently of Sta Cecilia. As pope, he addressed a fruitless summons to Christendom to unite in a crusade against the infidels, and concluded in 1489 a treaty with Bayezid II., agreeing in consideration of an annual payment of 40,000 ducats and the gift of the Holy Lance, to detain the sultan's fugitive brother Jem in close confinement in the Vatican. Innocent excommunicated and deposed Ferdinand, king of Naples, by bull of the 11th of September 1489, for refusal to pay the papal dues, and gave his kingdom to Charles VIII. of France, but in 1492 restored Ferdinand to favour. He declared (1486) Henry VII. to be lawful king of England by the threefold right of conquest, inheritance and popular choice, and approved his marriage with Elizabeth, the daughter of Edward IV. Innocent, like his predecessor, hated heresy, and in the bull *Summis desiderantes* (5th of December 1484) he instigated very severe measures against magicians and witches in Germany; he prohibited (1486) on pain of excommunication the reading of the propositions of Pico della Mirandola; he appointed (1487) T. Torquemada to be grand inquisitor of Spain; and he offered plenary indulgence to all who would engage in a crusade against the Waldenses. He took the first steps towards the canonization of Queen Margaret of Scotland, and sent missionaries under Portuguese auspices to the Congo. An important event of his pontificate was the capture of Granada (2nd of January 1492), which was celebrated at Rome with great rejoicing and for which Innocent gave to Ferdinand of Aragon the title of "Catholic Majesty." Innocent was genial, skilled in flattery, and popular with the Romans, but he lacked talent and relied on the stronger will of Cardinal della Rovere, afterwards Julius II. His Curia was notoriously corrupt, and he himself openly practised nepotism in favour of his children, concerning whom the epigram is quoted: "Octo nocens pueros genuit, totidemque puellas:—Hunc merito poterit dicere Roma patrem." Thus he gave to his undeserving son Franceschetto several towns near Rome and married him to the daughter of Lorenzo de' Medici. Innocent died on the 25th of July 1492, and was succeeded by Alexander VI.

The sources for the life of Innocent VIII. are to be found in L. Muratori, *Rerum Italicarum Scriptores*, vol. 3, and in Raynaldus, a. 1484–1492. See also L. Pastor, *History of the Popes*, vol. 5, trans. by F. I. Antrobus (London, 1898); M. Creighton, *History of the Papacy*, vol. 4 (London, 1901); F. Gregorovius, *Rome in the Middle Ages*, vol. 7, trans. by Mrs. G. W. Hamilton (London, 1900–1902); T. Hagen, *Die Papstwahlen von 1484 u. 1492* (Brizen, 1885); S. Riezler, *Die Hexenprozesse* (1896); G. Viani, *Memorie della famiglia Cybo* (Pisa, 1808); F. Serdonati, *Vita e fatti d'Innocenzo VIII.* (Milan, 1829). (C. H. HA.)

INNOCENT IX. (Giovanni Antonio Fachinetti) was born in 1519. He filled the offices of apostolic vicar of Avignon, legate at the council of Trent, nuncio to Venice, and president of the Inquisition. He became cardinal in 1583; and under the invalid Gregory XIV. assumed almost the entire conduct of affairs. His election to the papacy, on the 29th of October 1591, was brought about by Philip II., who profited little by it, however, inasmuch as Innocent soon succumbed to age and feebleness, dying on the 30th of December 1591.

See Ciaconius, *Vitae et res gestae summorum Pontiff. Rom.* (Rome, 1601–1602); Cicarella, continuator of Platina, *De Vitis Pontiff. Rom.* (both contemporaries of Innocent); Ranke, *Popes* (Eng. trans., Austin), ii. 233 sq. (all brief accounts). (T. F. C.)

INNOCENT X. (Giovanni Battista Pamfili) was born in Rome on the 6th of May 1574, served successively as auditor of the Rota, nuncio to Naples, legate apostolic to Spain, was made cardinal in 1627, and succeeded Urban VIII. as pope on the 15th of September 1644. Throughout his pontificate Innocent was completely dominated by his sister-in-law, Donna Olimpia Maidalchini, a woman of masculine spirit. There is no reason to credit the scandalous reports of an illicit attachment. Nevertheless, the influence of Donna Olimpia was baneful; and she made herself thoroughly detested for her inordinate ambition and rapacity. Urban VIII. had been French in his sympathies; but the papacy now shifted to the side of the Habsburgs, and there remained for nearly fifty years. Evidences of the change were numerous: Innocent promoted pro-Spanish cardinals; attacked the Barberini, protégés of Mazarin, and sequestered their possessions; aided in quieting an insurrection in Naples, fomented by the duke of Guise; and refused to recognize the independence of Portugal, then at war with Spain. As a reward he obtained from Spain and Naples the recognition of ecclesiastical immunity. In 1649 Castro, which Urban VIII. had failed to take, was wrested from the Farnese and annexed to the Papal States. The most worthy efforts of Innocent were directed to the reform of monastic discipline (1652). His condemnation of Jansenism (1653) was met with the denial of papal infallibility in matters of *fact*, and the controversy entered upon a new phase (see JANSENISM). Although the pontificate of Innocent witnessed the conversion of many Protestant princes, the most notable being Queen Christina of Sweden, the papacy had nevertheless suffered a perceptible decline in prestige; it counted for little in the negotiations at Münster, and its solemn protest against the peace of Westphalia was entirely ignored. Innocent died on the 7th of January 1655, and was succeeded by Alexander VII.

For contemporary lives of Innocent see Oldoin, continuator of Ciaconius, *Vitae et res gestae summorum Pontiff. Rom.*; and Palazzi, *Gesta Pontiff. Rom.* (Venice, 1687–1688) iv. 570 sqq.; Ciampi's *Innoc. X. Pamfili, et la sua Corte* (Rome, 1878), gives a very full account of the period. Gualdus' (pseud. of Gregorio Leti; v. bibliog. note, art. "SIXTUS V.") *Vita de Donna Olimpia Maidalchina* (1666) is gossipy and untrustworthy; Capranica's *Donna Olympia Pamfili* (Milan, 1875, 3rd ed.) is fanciful and historically of no value. See also Ranke, *Popes* (Eng. trans., Austin), iii. 40 sqq.; v. Reumont, *Gesch. der Stadt Rom.* iii. 2, p. 623 sqq.; Brosch, *Gesch. des Kirchenstaates* (1880) i. 409 sqq.; and the extended bibliography in Herzog-Hauck, *Realencyklopädie*, s.v. "Innocenz X." (T. F. C.)

INNOCENT XI. (Benedetto Odescalchi), pope from 1676 to 1689, was born at Como on the 16th of May 1611. He studied law in Rome and Naples, entered the Curia under Urban VIII. (his alleged military service seems to be questionable), and became successively protonotary, president of the Apostolic Chamber, governor of Macerate and commissary of Ancona. Innocent X. made him a cardinal (1647), legate to Ferrara, and, in 1650, bishop of Novara. His simple and blameless life, his conscientious discharge of duty, and his devotion to the needs of the poor had won for him such a name that, despite the opposition of France, he was chosen to succeed Clement X. on the 21st of September 1676. He at once applied himself to moral and administrative reform; declared against nepotism, introduced economy, abolished sinecures, wiped out the deficit (at the same time reducing rents), closed the gaming-houses, and issued a number of sumptuary ordinances. He held monks strictly to the performance of their vows; took care to satisfy himself of the fitness of candidates for bishoprics; enjoined regular catechetical instruction, greater simplicity in preaching, and greater reverence in worship. The moral teaching of the Jesuits incurred his condemnation (1679) (see LIGUORI), an act which the society never forgave, and which it partially revenged by forcing, through the Inquisition, the condemnation of the quietistic doctrines of Molinos (1687), for which Innocent entertained some sympathy (see MOLINOS).

The pontificate of Innocent fell within an important period in European politics, and he himself played no insignificant rôle. His protest against Louis XIV.'s extended claim to regalian rights called forth the famous Declaration of Gallican Liberties by a subservient French synod under the lead of Bossuet (1682), which the pope met by refusing to confirm Louis's clerical appointments. His determination to restrict the ambassadorial right of asylum, which had been grossly abused, was resented by Louis, who defied him in his own capital, seized the papal territory of Avignon, and talked loudly of a schism, without, however, shaking the pope in his resolution. The preponderance of France Innocent regarded as a menace to Europe. He opposed Louis's candidate for the electorate of Cologne (1688), approved the League of Augsburg, acquiesced in the designs of the Protestant William of Orange, even in his supplanting James II., whom, although a Roman Catholic, he distrusted as a tool of Louis. The great object of Innocent's desire was the repulse of the Turks, and his unwearying efforts to that end entitled him to share in the glory of relieving Vienna (1683).

Innocent died on the 12th of August 1689, lamented by his subjects. His character and life were such as to suggest the propriety of canonization, but hostile influences have defeated every move in that direction.

The life of Innocent has been frequently written. See Guarnacci, *Vitae et res gestae Pontiff. Rom.* (Rome, 1751), i. 105 sqq.; Palazzi, *Gesta Pontiff. Rom.* (Venice, 1690); also the lives by Albrizzi (Rome, 1695); Buonamici (Rome, 1776); and Immich (Berlin, 1900). Particular phases of Innocent's activity have been treated by Michaud, *Louis XIV. et Innoc. XI.* (Paris, 1882 sqq., 4 vols.); Dubruel, *La Correspond. . . . du Card. Carlo Pio*, &c. (see *Rev. des quest. hist.* lxxv. (1904) 602 sqq.); and Gerin, in *Rev. des quest. hist.*, 1876, 1878, 1886. For correspondence of Innocent see Colombo, *Notizie biogr. e lettere di P. Innoc. XI.* (Turin, 1878); and Berthier, *Innoc. PP. XI. Epp. ad Principes* (Rome, 1890 sqq.). An extended bibliography may be found in Herzog-Hauck, *Realencyklopädie*, s.v. "Innocenz XI." (T. F. C.)

Innocent XII. (Antonio Pignatelli), pope from 1691 to 1700 in succession to Alexander VIII., was born in Naples on the 13th of March 1615, was educated at the Jesuit College in Rome, entered upon his official career at the age of twenty, and became vice-legate of Urbino, governor of Perugia, and nuncio to Tuscany, to Poland and to Austria. He was made cardinal and archbishop of Naples by Innocent XI., whose pontificate he took as a model for his own, which began on the 12th of July 1691. Full of reforming zeal, he issued ordinances against begging, extravagance and gambling; forbade judges to accept presents from suitors; built new courts of justice; prohibited the sale of offices, maintaining the financial equilibrium by reducing expenses; and, an almost revolutionary step, struck at the root of nepotism, in a bull of 1692 ordaining that thenceforth no pope should grant estates, offices or revenues to any relative. Innocent likewise put an end to the strained relations that had existed between France and the Holy See for nearly fifty years. He adjusted the difficulties over the regalia, and obtained from the French bishops the virtual repudiation of the Declaration of Gallican Liberties. He confirmed the bull of Alexander VIII. against Jansenism (1696); and, in 1699, under pressure from Louis XIV., condemned certain of Fénelon's doctrines which Bossuet had denounced as quietistic (see Fénelon). When the question of the Spanish succession was being agitated he advised Charles II. to make his will in favour of the duke of Anjou. Innocent died, on the eve of the great conflict, on the 27th of September 1700. Moderate, benevolent, just, Innocent was one of the best popes of the modern age.

See Guarnacci, *Vitae et res gestae Pontiff. Rom.* (Rome, 1751), i. 389 sqq.; Ranke, *Popes* (Eng. trans., Austin), iii. 186 sqq.; v. Reumont, *Gesch. der Stadt Rom.* iii. 2, p. 640 sqq.; and the *Bullarium Innoc. XII.* (Rome, 1697). (T. F. C.)

Innocent XIII. (Michele Angelo Conti), pope from 1721 to 1724, was the son of the duke of Poli, and a member of a family that had produced several popes, among them Innocent III., was born in Rome on the 13th of May 1655, served as nuncio in Switzerland, and, for a much longer time, in Portugal, was made cardinal and bishop of Osimo and Viterbo by Clement XI., whom he succeeded on the 8th of May 1721. One of his first acts was to invest the emperor Charles VI. with Naples (1722); but against the imperial investiture of Don Carlos with Parma and Piacenza he protested, albeit in vain. He recognized the Pretender, "James III.," and promised him subsidies conditional upon the re-establishment of Roman Catholicism in England. Moved by deep-seated distrust of the Jesuits and by their continued practice of "Accommodation," despite express papal prohibition (see Clement XI.), Innocent forbade the Order to receive new members in China, and was said to have meditated its suppression. This encouraged the French Jansenist bishops to press for the revocation of the bull *Unigenitus*; but the pope commanded its unreserved acceptance. He weakly yielded to pressure and bestowed the cardinal's hat upon the corrupt and debauched Dubois. Innocent died on the 7th of March 1724, and was succeeded by Benedict XIII.

See Guarnacci, *Vitae et res gestae Pontiff. Rom.* (Rome, 1751), ii. 137 sqq., 381 sqq.; Sandini, *Vitae Pontiff. Rom.* (Padua, 1739); M. v. Mayer, *Die Papstwahl Innocenz' XIII.* (Vienna, 1874); Michaud, "La Fin du Clement XI. et le commencement du pontificat d'Innocent XIII." in the *Internat. Theol. Zeitschr.* v. 42 sqq., 304 sqq. (T. F. C.)

INNOCENTS' DAY, or Childermas, a festival celebrated in the Latin church on the 28th of December, and in the Greek church on the 29th (O.S.) in memory of the massacre of the children by Herod. The Church early regarded these little ones as the first martyrs. It is uncertain when the day was first kept as a saint's day. At first it seems to have been absorbed into the celebration of the Epiphany, but by the 5th century it was kept as a separate festival. In Rome it was a day of fasting and mourning. In the middle ages the festival was the occasion for much indulgence to the children. The boy-bishop (*q.v.*), whose tenure of office lasted till Childermas, had his last exercise of authority then, the day being one of the series of days which were known as the Feast of Fools. Parents temporarily abdicated authority, and in nunneries and monasteries the youngest nun and monk were for the twenty-four hours allowed to masquerade as abbess and abbot. These mockeries of religion were condemned by the Council of Basel (1431); but though shorn of its extravagances the day is still observed as a feast day and merry-making for children in Catholic countries, and particularly as an occasion for practical joking like an April Fool's Day. In Spanish-America when such a joke has been played, the phrase equivalent to "You April fool!" is *Que la inocencia le valga!* May your innocence protect you! The society of Lincoln's Inn specially celebrated Childermas, annually electing a "king of the Cockneys." Innocents' Day was ever accounted unlucky. Nothing was begun and no marriages took place then. Louis XI. prohibited all state business. The coronation of Edward IV., fixed for a Sunday, was postponed till the Monday when it was found the Sunday fell on the 28th of December. In rural England it was deemed unlucky to do housework, put on new clothes or pare the nails. At various places in Gloucestershire, Somerset and Worcestershire muffled peals were rung (*Notes and Queries*, 1st series, vol. viii. p. 617). In Northampton the festival was called "Dyzemas Day" (possibly from Gr. δυσ- "ill" and "mass"), and there is a proverb "What is begun on Dyzemas will never be finished." The Irish call the day *La Croasta na bliana*, "the cross day of the year," or *Diar dasin darg*, "blood Thursday," and many legends attach to it (*Notes and Queries*, 4th series, vol. xii. p. 185). In medieval England the children were reminded of the mournfulness of the day by being whipped in bed on Innocents' morning. This custom survived to the 17th century.

INNSBRUCK, the capital of the Austrian province of Tirol, and one of the most beautifully situated towns in Europe. In 1900 the population was 26,866 (with a garrison of about 2000 men), mainly German-speaking and Romanist. Built at a height of 1880 ft., in a wide plain formed by the middle valley of the Inn and on the right bank of that river, it is surrounded by lofty mountains that seem to overhang the town. It occupies a strong military position (its commercial and industrial importance is now but secondary) at the junction of the great highway from Germany to Italy over the Brenner Pass, by which it is by rail 109½ m. from Munich and 174½ m. from Verona, with that from Bregenz in the Vorarlberg, distant 122 m., by rail under the Arlberg Pass. It takes its name from its position, close to the chief bridge over the Inn. It is the seat of the supreme judicial court of the Tirol, the Diet of which meets in the Landhaus. The streets are broad, there are several open places and the houses are handsome, many of those in the old town dating from the 17th and 18th centuries, and being adorned with frescoes, while the arcades beneath are used as shops.

The principal monument is the Franciscan or Court church (1553–1563). In it is the magnificent 16th-century cenotaph (his body is elsewhere) of the emperor Maximilian (d. 1519), who, as count of the Tirol from 1490 onwards, was much beloved by his subjects. It represents the emperor kneeling in prayer on a gigantic marble sarcophagus, surrounded by twenty-eight colossal bronze statues of mourners, of which twenty-three figure ancestors, relatives or contemporaries of Maximilian, while five represent his favourite heroes of antiquity—among these five are the two finest statues (both by Peter Vischer of Nuremberg), those of King Arthur of Britain and of Theodoric, the Ostrogothic king. On the sides of the sarcophagus are twenty-four marble reliefs, depicting the principal events in the life of Maximilian, nearly all by Alexander Colin of Malines, while the general design of the whole monument is attributed to Gilg Sesselschreiber, the court painter. In one of the aisles of the same church is the Silver Chapel, so called from a silver Madonna and silver bas-reliefs on the altar; it contains the tombs of Archduke Ferdinand, count of the Tirol (d. 1595) and his non-royal wife, Philippine Welser of Augsburg (d. 1580), whose happy married life spent close by is one of the most romantic episodes in Tirolese history. In the other aisle are the tombs, with monuments, of the heroes of the War of Independence of 1809, Hofer, Haspinger and Speckbacher. It was in this church that Queen Christina of Sweden, daughter of Gustavus Adolphus, abjured Protestantism, in 1655. There are also several other churches and convents, among the latter the first founded (1593) in Germany by the Capuchins.

The university of Innsbruck was formally founded in 1677, and refounded (after two periods of suspension, 1782–1792 and 1810–1826) in 1826. It is attended by about 1000 students and has a large staff of professors, the theological faculty being controlled by the Jesuits. It has a library of 176,000 books, and 1049 MSS. The University or Jesuit church dates from the early 17th century. The Ferdinandeum is the provincial museum (founded in 1823, though the present building is later). The house known as the Goldne Dachl has its roof covered with gilded copper tiles; it was built about 1425, by Frederick, count of the Tirol, nicknamed "with the empty pockets," but the balcony and gilded roof were added in 1500 by the emperor Maximilian. Among the other monuments of Innsbruck may be mentioned the Pillar of St Anne, erected in 1706 to commemorate the repulse of the French and the Bavarians in 1703; the Triumphal Arch, built in 1765, on the occasion of the marriage of the future emperor Leopold II. with the Infanta Maria Louisa of Spain; and a fountain, with a bronze statue of Archduke Leopold V., set up in 1863–1877, in memory of the five-hundredth anniversary of the union of the Tirol with Austria.

The Roman station of Veldidena was succeeded by the Premonstratensian abbey of Wilten, both serving to guard the important strategical bridge over the Inn. In 1180 the count of Andechs (the local lord) moved the market-place over to the right bank of the river (where is the convent), and in 1187 we first hear of the town by its present name. Between 1233 and 1235 it was fortified, and a castle built for the lord. But it was only about 1420 that Archduke Frederick IV. ("with the empty pockets") built himself a new castle in Innsbruck, which then replaced Meran as the capital of Tirol. The county of Tirol was generally held by a cadet line of the Austrian house, the count being almost an independent ruler. But the last princeling of this kind died in 1665, since which date Innsbruck and Tirol have been governed from Vienna. In 1552 Maurice of Saxony surprised and nearly took Innsbruck, almost capturing the emperor Charles V. himself, who escaped owing to a mutiny among Maurice's troops. In the patriotic war of 1809, Innsbruck played a great part and suffered much, while in 1848, at the time of the revolution in Vienna, it joyfully received the emperor Ferdinand. (W. A. B. C.)

INNS OF COURT. The Inns of Court and Chancery are voluntary non-corporate legal societies seated in London, having their origin about the end of the 13th and the commencement of the 14th century.

Dugdale (*Origines Juridiciales*) states that the learned in English law were anciently persons in holy orders, the justices of the king's court being bishops, abbots and the like. But in 1207 the clergy were prohibited by canon from acting in the temporal courts. The result proving prejudicial to the interests of the community, a commission of inquiry was issued by Edward I. (1290), and this was followed up (1292) by a second commission, which among other things directed that students "apt and eager" should be brought from the provinces and placed in proximity to the courts of law now fixed by Magna Carta at Westminster (see INN). These students were accordingly located in what became known as the Inns of Court and Chancery, the latter designated by Fortescue (*De Laudibus*) as "the earliest settled places for students of the law," the germ of what Sir Edward Coke subsequently spoke of as our English juridical university. In these Inns of Court and Chancery, thus constituted, and corresponding to the ordinary college, the students, according to Fortescue, not only studied the laws and divinity, but further learned to dance, sing and play instrumental music, "so that these hostels, being nurseries or seminaries of the court, were therefore called Inns of Court."

Stow in his *Survey* (1598) says: "There is in and about this city a whole university, as it were, of students, practisers or pleaders and judges of the laws of this realm"; and he goes on to enumerate the several societies, fourteen in number, then existing, corresponding nearly with those recognized in the present day, of which the Inns of Court, properly so-called, are and always have been four, namely *Lincoln's Inn*, the *Inner Temple*, the *Middle Temple* and *Gray's Inn*. To these were originally attached as subordinate Inns of Chancery, Furnival's Inn, Thavie's Inn (to Lincoln's Inn), Clifford's Inn, Clement's Inn (to the Inner Temple), New Inn (to the Middle Temple), Staple's Inn, Barnard's Inn (to Gray's Inn), but they were cut adrift by the older Inns and by the middle of the 18th century had ceased to have any legal character (*vide infra*). In addition to these may be specified *Serjeant's Inn*, a society composed solely of serjeants-at-law, which ceased to exist in 1877. Besides the Inns of Chancery above enumerated, there were others, such as Lyon's Inn, which was pulled down in 1868, and Scrope's Inn and Chester or Strand Inn, spoken of by Stow, which have long been removed, and the societies to which they belonged have disappeared. The four Inns of Court stand on a footing of complete equality, no priority being conceded to or claimed by one inn over another. Their jurisdictions and privileges are equal, and upon affairs of common interest the benchers of the four inns meet in conference. From the earliest times there has been an interchange of fellowship between the four houses; nevertheless the Middle Temple and Lincoln's Inn, and the Inner Temple and Gray's Inn, have maintained a closer alliance.

The members of an Inn of Court consist of benchers, barristers and students. The benchers are the senior members of the society, who are invested with the government of the body to which they belong. They are more formally designated "masters of the bench," are self-elected and unrestricted as to numbers. Usually a member of an inn, on attaining the rank of king's counsel, is invited to the bench. Other members of long standing are also occasionally chosen, but no member by becoming a king's counsel or by seniority of standing acquires the right of being nominated a bencher. The benchers vary in number from twenty in Gray's Inn to seventy and upwards in Lincoln's Inn and the Inner Temple. The powers of the benchers are practically without limit within their respective societies; their duties, however, are restricted to the superintendence and management of the concerns of the inn, the admission of candidates as students, the calling of them to the bar and the exercise of discipline generally over the members. The meetings of the benchers are variously denominated a "parliament" in the Inner and Middle Temples, a "pension" in Gray's Inn and a "council" in Lincoln's Inn. The judges of the superior courts are the visitors of the inns, and to them alone can an appeal be had when either of the societies refuses to call a member to the bar, or to reinstate in his privileges a barrister who has been disbarred for misconduct. The presiding or chief officer is the treasurer, one of the benchers, who is elected annually to that dignity. Other benchers fulfil the duties of master of the library, master of the walks or gardens, dean of the chapel and so forth, while others are readers, whose functions are referred to below.

The usages of the different inns varied somewhat formerly in regard both to the term of probationary studentship enforced and to the procedure involved in a "call" to the bar by which the student is converted into the barrister. In the present day the entrance examination, the course of study and the examinations to be passed on the completion of the curriculum are identical and common to all the inns (see ENGLISH LAW). When once called to the bar, no hindrance beyond professional etiquette limits a barrister's freedom of action; so also members may on application to the benchers, and on payment of arrears of dues (if any), leave the society to which they belong, and thus cease altogether to be members of the bar likewise. A member of an Inn of Court retains his name on the lists of his inn for life by means of a small annual payment varying from £1 to £5, which at one or two of the inns is compounded for by a fixed sum taken at the call to the bar.

The ceremony of the "call" varies in detail at the different inns. It takes place after dinner (before dinner at the Middle Temple, which is the only inn at which students are called in their wigs and gowns), in the "parliament," "pension" or "council" chamber of the benchers. The benchers sit at a table round which are ranged the students to be called. Each candidate being provided with a glass of wine, the treasurer or senior bencher addresses them and the senior student briefly replies. "Call Parties" are also generally held by the new barristers; at the Middle Temple they are allowed in hall.

During the reign of Edward III. the Inns of Court and Chancery, based on the collegiate principle, prospered under the supervision and protection of the crown. In 1381 Wat Tyler invaded the Temple, and in the succeeding century (1450) Jack Cade meditated pulling down the Inns of Court and killing the lawyers. It would appear, moreover, that the inmates of the inns were themselves at times disorderly and in conflict with the citizens. Fortescue (*c.* 1464) describing these societies thus speaks of them: "There belong to the law ten lesser inns, which are called the Inns of Chancery, in each of which there are one hundred students at least, and in some a far greater number, though not constantly residing. After the students have made some progress here they are admitted to the Inns of Court. Of these there are four, in the least frequented of which there are about two hundred students. The discipline is excellent, and the mode of study well adapted for proficiency." This system had probably existed for two centuries before Fortescue wrote, and continued to be enforced down to the time of Sir Thomas More (1498), of Chief Justice Dyer (1537) and of Sir Edward Coke (1571). By the time of Sir Matthew Hale (1629) the custom for law students to be first entered to an Inn of Chancery before being admitted to an Inn of Court had become obsolete, and thenceforth the Inns of Chancery have been abandoned to the attorneys. Stow in his *Survey* succinctly points out the course of reading enforced at the end of the 16th century. He says that the Inns of Court were replenished partly by students coming from the Inns of Chancery, who went thither from the universities and sometimes immediately from grammar schools; and, having spent some time in studying the first elements of the law, and having performed the exercises called "bolts," "moots" and "putting of cases," they proceeded to be admitted to, and become students in, one of the Inns of Court. Here continuing for the space of seven years or thereabouts, they frequented readings and other learned exercises, whereby, growing ripe in the knowledge of the laws, they were, by the general consent either of the benchers or of the readers, called to the degree of barrister, and so enabled to practise in chambers and at the bar. This ample provision for legal study continued with more or less vigour down to nearly the commencement of the 18th century. A languor similar to that which affected the church and the universities then gradually supervened, until the fulfilment of the merest forms sufficed to confer the dignity of advocate and pleader. This was maintained until about 1845, when steps were taken for reviving and extending the ancient discipline and course of study, bringing them into harmony with modern ideas and requirements.

The fees payable vary slightly at the different inns, but average about £150. This sum covers all expenses from admission to an inn to the call at the bar, but the addition of tutorial and other expenses may augment the cost of a barrister's legal education to £400 or £500. The period of study prior to call must not be less than twelve terms, equivalent to about three years. Solicitors, however, may be called without keeping any terms if they have been in practice for not fewer than five consecutive years.

It has been seen that the studies pursued in ancient times were conducted by means of "readings," "moots" and "bolts." The *readings* were deemed of vital importance, and were delivered in the halls with much ceremony; they were frequently regarded as authorities and cited as such at Westminster in argument. Some statute or section of a statute was selected for analysis and explanation, and its relation to the common law pointed out. Many of these readings, dating back to Edward I., are extant, and well illustrate the importance of the subjects and the exhaustive and learned manner in which they were treated. The function of "reader" involved the holder in very weighty expenses, chiefly by reason of the profuse hospitality dispensed—a constant and splendid table being kept during the three weeks and three days over which the readings extended, to which were invited the nobility, judges, bishops, the officers of state and sometimes the king himself. In 1688 the readers were paid £200 for their reading, but by that time the office had become a sinecure. In the present day the readership is purely honorary and without duties. The privilege formerly assumed by the reader of calling to the bar was taken away in 1664 by an order of the lord chancellor and the judges. *Moots* were exercises of the nature of formal arguments on points of law raised by the students and conducted under the supervision of a bencher and two barristers sitting as judges in the halls of the inns. *Bolts* were of an analogous character, though deemed inferior to moots.

In the early history of the inns discrimination was exercised in regard to the social status of candidates for admission to them. Sir John Ferne, a writer of the 16th century, referred to by Dugdale, states that none were admitted into the houses of court except they were gentlemen of blood. So also Pliny, writing in the 1st century of the Christian era (*Letters*, ii. 14), says that before his day young men even of the highest families of Rome were not admitted to practice except upon the introduction of some man of consular rank. But he goes on to add that all barriers were then broken down, everything being open to everybody—a remark applicable to the bar of England and elsewhere in the present day. It may here be noted that no dignity or title confers any rank at the bar. A privy councillor, a peer's son, a baronet, the speaker of the House of Commons or a knight—all rank at the bar merely according to their legal precedence. Formerly orders were frequently issued both by the benchers and by the crown on the subject of the dress, manners, morals and religious observances of students and members. Although some semblance of a collegiate discipline is still maintained, this is restricted to the dining in hall, where many ancient usages survive, and to the closing of the gates of the inns at night.

Each inn maintains a chapel, with the accompaniment of preachers and other clergy, the services being those of the Church of England. The Inner and the Middle Temple have joint use of the Temple church. The office of preacher is usually filled by an ecclesiastic chosen by the benchers. The principal ecclesiastic of the Temple church is, however, constituted by letters patent by the crown without episcopal institution or induction, enjoying, nevertheless, no authority independently of the benchers. He bears the title of Master of the Temple.

It has already been stated, on the authority of Fortescue, that the students of the Inns of Court learned to dance, sing and play instrumental music; and those accomplishments found expression in the "masques" and "revels" for which the societies formerly distinguished themselves, especially the Inner Temple and Gray's Inn. These entertainments were of great antiquity and much magnificence, involving very considerable expense. Evelyn (*Diary*) speaks of the revels at the Middle Temple as an old and riotous custom, having relation neither to virtue nor to policy. The last revel appears to have been held at the Inner Temple in 1734, to mark the occasion of the elevation of Lord Chancellor Talbot to the woolsack. The plays and masques performed were sometimes repeated elsewhere than in the hall of the inn, especially before the sovereign at court. A master of the revels was appointed, commonly designated Lord of Misrule. There is abundant information as to the scope and nature of these entertainments: one of the festivals is minutely described by Gerard Leigh in his *Accedence of Armorie*, 1612; and a tradition ascribes the first performance of Shakespeare's *Twelfth Night* to a revel held in the Middle Temple hall in February 1601. The hospitality of the inns now finds expression mainly in the "Grand Day," held once in each of the four terms, when it is customary for the judges and other distinguished visitors to dine with the benchers (who sit apart from the barristers and students on a daïs in some state), and "Readers' Feast," on both which occasions extra commons and wine are served to the members attending. But the old customs also found some renewal in the shape of balls, concerts, garden-parties and other entertainments. In 1887 there was a revival (the first since the 17th century) of the Masque of Flowers at both the Inner Temple and Gray's Inn. The Royal Horticultural Society's annual exhibition of flowers and fruit is held in May in the Temple Gardens. Plays are also occasionally performed in the Temple, Robert Browning's *Sordello* being acted in 1902 by a company of amateurs, most of whom were either members of the bar or connected with the legal profession.

The *Inner* and the *Middle Temple*, so far as their history can be traced, have always been separate societies. Fortescue, writing between 1461 and 1470, makes no allusion to a previous junction of the two inns. Dugdale (1671) speaks of the Temple as having been one society, and states that the students so increased in number that at length they divided, becoming the Inner and Middle Temple respectively. He does not, however, give any authority for this statement, or furnish the date of the division. The first trustworthy mention of the Temple as an inn of court is found in the *Paston Letters*, where, under date November 1440, the Inner Temple is spoken of as a college, as is also subsequently the Middle Temple. The Temple had been the seat in England of the Knights Templars, on whose suppression in 1312 it passed with other of their possessions to the crown, and after an interval of some years to the Knights Hospitallers of St John of Jerusalem, who in the reign of Edward III. demised the mansion and its surroundings to certain professors of the common law who came from Thavie's Inn. Notwithstanding the destruction of the muniments of the Temple by fire or by popular commotion, sufficient testimony is attainable to show that in the reigns of Edward III. and Richard II. the Temple had become the residence of the legal communities which have since maintained there a permanent footing. The two societies continued as tenants to the Knights Hospitallers of St John until the dissolution of the order in 1539; they then became the lessees of the crown, and so remained until 1609, when James I. made a grant by letters patent of the premises in perpetuity to the benchers of the respective societies on a yearly payment by each of £10, a payment bought up in the reign of Charles II. In this grant the two inns are described as "the Inner and the Middle Temple or New Temple," and as "being two out of those four colleges the most famous of all Europe" for the study of the law. Excepting the church, nothing remains of the edifices belonging to the Knights Templars, the present buildings having been almost wholly erected since the reign of Queen Elizabeth or since the Great Fire, in which the major part of the Inner Temple perished. The church has been in the joint occupation of the Inner and Middle Temple from time immemorial—the former taking the southern and the latter the northern half. The round portion of the church was consecrated in 1185, the nave or choir in 1240. It is the largest and most complete of the four remaining round churches in England, and is built on the plan of the church of the Holy Sepulchre at Jerusalem. Narrowly escaping the ravages of the fire of 1666, this beautiful building is one of the most perfect specimens of early Gothic architecture in England. In former times the lawyers awaited their clients for consultation in the Round Church, as similarly the serjeants-at-Law were accustomed to resort to St Paul's Cathedral, where each serjeant had a pillar assigned him.

The *Inner Temple*, comprehending a hall, parliament chamber, library and other buildings, occupies the site of the ancient mansion of the Knights Templars, built about the year 1240, and has from time to time been more or less rebuilt and extended, the present handsome range of buildings, including a new dining hall, being completed in 1870. The library owes its existence to William Petyt, keeper of the Tower Records in the time of Queen Anne, who was also a benefactor to the library of the Middle Temple. The greatest addition by gift was made by the Baron F. Maseres in 1825. The number of volumes now in the library is 37,000. Of the Inns of Chancery belonging to the Inner Temple *Clifford's Inn* was anciently the town residence of the Barons Clifford, and was demised in 1345 to a body of students of the law. It was the most important of the Inns of Chancery, and numbered among its members Coke and Selden. At its dinners a table was specially set aside for the "Kentish Mess," though it is not clear what connexion there was between the Inn and the county of Kent. It was governed by a principal and twelve rulers. *Clement's Inn* was an Inn of Chancery before the reign of Edward IV., taking its name from the parish church of St Clement Danes, to which it had formerly belonged. Clement's Inn was the inn of Shakespeare's Master Shallow, and was the Shepherd's Inn of Thackeray's *Pendennis*. The buildings of Clifford's Inn survive (1910), but of Clement's Inn there are left but a few fragments.

The *Middle Temple* possesses in its hall one of the most stately of existing Elizabethan buildings. Commenced in 1562, under the auspices of Edmund Plowden, then treasurer, it was not completed until 1572, the richly carved screen at the east end in the style of the Renaissance being put up in 1575. The belief that the screen was constructed of timber taken from ships of the Spanish Armada (1588) is baseless. The hall, which has been preserved unaltered, has been the scene of numerous historic incidents, notably the entertainments given within its walls to regal and other personages from Queen Elizabeth downwards. The library, which contains about 28,000 volumes, dates from 1641, when Robert Ashley, a member of the society, bequeathed his collection of books in all classes of literature to the inn, together with a large sum of money; other benefactors were Ashmole (the antiquary), William Petyt (a benefactor of the Inner Temple) and Lord Stowell. From 1711 to 1826 the library was greatly neglected; and many of the most scarce and valuable books were lost. The present handsome library building, which stands apart from the hall, was completed in 1861, the prince of Wales (afterwards Edward VII.) attending the inauguration ceremony on October 31st of that year, and becoming a member and bencher of the society on the occasion. He afterwards held the office of treasurer (1882). The MSS. in the collection are few and of no special value. In civil, canon and international law, as also in divinity and ecclesiastical history, the library is very rich; it contains also some curious works on witchcraft and demonology. There was but one Inn of Chancery connected with the Middle Temple, that of *New Inn*, which, according to Dugdale, was formed by a society of students previously settled at St George's Inn, situated near St Sepulchre's Church without Newgate; but the date of this transfer is not known. The buildings have now been pulled down.

Lincoln's Inn stands on the site partly of an episcopal palace erected in the time of Henry III. by Ralph Nevill, bishop of Chichester and chancellor of England, and partly of a religious house, called Black Friars House, in Holborn. In the reign of Edward II., Henry Lacy, earl of Lincoln, possessed the place, which from him acquired the name of Lincoln's Inn, probably becoming an Inn of Court soon after his death (in 1310), though of its existence as a place of legal study there is little authentic record until the time of Henry VI. (1424), to which date the existing muniments reach back. The fee simple of the inn would appear to have remained vested in the see of Chichester; and it was not until 1580 that the society which for centuries had occupied the inn as tenants acquired the absolute ownership of it. The old hall, built about 1506, still remains, but has given place to a modern structure designed by Philip Hardwick, R.A., which, along with the buildings containing the library, was completed in 1845, Queen Victoria attending the inauguration ceremony (October 13). The chapel, built after the designs of Inigo Jones, was consecrated in 1623. The library—as a collection of law books the most complete in the country—owes its foundation to a bequest of John Nethersale, a member of the society, in 1497, and is the oldest of the existing libraries in London. Various entries in the records of the inn relate to the library, and notably in 1608, when an effort was made to extend the collection, and the first appointment of a master of the library (an office now held in annual rotation by each bencher) was made. The library has been much enriched by donations and by the acquisition by purchase of collections of books on special subjects. It includes also an extensive and valuable series of MSS., the whole comprehending 50,000 volumes. The prince of Wales (George V.), a bencher of the society, filled the office of treasurer in 1904. The Inns of Chancery affiliated to Lincoln's Inn were Thavie's Inn and Furnival's Inn. *Thavie's Inn* was a residence of students of the law in the time of Edward III., and is mentioned by Fortescue as having been one of the lesser houses of Lincoln's Inn for some centuries. It thus continued down to 1769, when the inn was sold by the benchers, and thenceforth it ceased to have any character as a place of legal education. *Furnival's Inn* became the resort of students about the year 1406, and was purchased by the society of Lincoln's Inn in 1547. It was governed by a principal and twelve antients. In 1817 the Inn was rebuilt, but from that date it ceased to exist as a legal community and is now demolished.

The exact date of *Gray's Inn* becoming the residence of lawyers is not known, though it was so occupied before the year 1370. The inn stands upon the site of the manor of Portpoole, belonging in ancient times to the dean and chapter of St Paul's, but subsequently the property of the family of Grey de Wilton and eventually of the crown, from which a grant of the manor or inn was obtained, many years since discharged from any rent or payment. The hall of the inn is of handsome design, similar to the Middle Temple hall in its general character and arrangements, and was completed about the year 1560. The chapel, of much earlier date than the hall, has, notwithstanding its antiquity, little to recommend it to notice, being small and insignificant, and lacking architectural features of any kind. The library, including about 13,000 volumes, contains a small but important collection of MSS. and missals, and also some valuable works on divinity. Little is known of the origin or early history of the library, though mention is incidentally made of it in the society's records in the 16th and 17th centuries. The gardens, laid out about 1597, it is believed under the auspices of the lord chancellor Bacon, at that time treasurer of the society, continue to this day as then planned, though with some curtailment owing to the erection of additional buildings. Among many curious customs maintained in this inn is that of drinking a toast on grand days "to the glorious, pious and immortal memory of Queen Elizabeth." Of the special circumstances originating this display of loyalty there is no record. The Inns of Chancery connected with Gray's Inn are Staple and Barnard's Inns. *Staple Inn* was an Inn of Chancery in the reign of Henry V., and is probably of yet earlier date. Readings and moots were observed here with regularity. Sir Simonds d'Ewes mentions attending a moot in February 1624. The Inn, with its picturesque Elizabethan front, faces Holborn. It was sold by the antients in 1884 for £68,000. It is in a very good state of preservation, and it is the intention of the purchasers, the Prudential Assurance Company, to preserve it as a memorial of vanishing London. *Barnard's Inn*, anciently designated Mackworth Inn, was an Inn of Chancery in the reign of Henry VI. It was bequeathed by him to the dean and chapter of Lincoln. It is now the property of the Mercer's Company and is used as a school.

The *King's Inns, Dublin*, the legal school in Ireland, corresponds closely to the English Inns of Court, and is in many respects in unison with them in its regulations with regard to the admission of students into the society, and to the degree of barrister-at-law, as also in the scope of the examinations enforced. Formerly it was necessary to keep a number of terms at one of the Inns in London—the stipulation dating as far back as 1542 (33 Henry VIII. c. 3). Down to 1866 the course of education pursued at the King's Inns differed from the English Inns of Court in that candidates for admission to the legal profession as attorneys and solicitors carried on their studies with those studying for the higher grade of the bar in the same building under a professor specially appointed for this purpose,—herein following the usage anciently prevailing in the Inns of Chancery in London. This arrangement was put an end to by the Attorneys and Solicitors Act (Ireland) 1866. The origin of the King's Inns may be traced to the reign of Edward I., when a legal society designated Collett's Inn was established without the walls of the city; it was destroyed by an insurrectionary band. In the reign of Edward III. Sir Robert Preston, chief baron of the exchequer, gave up his residence within the city to the legal body, which then took the name of Preston's Inn. In 1542 the land and buildings known as Preston's Inn were restored to the family of the original donor, and in the same year Henry VIII. granted the monastery of Friars Preachers for the use of the professors of the law in Ireland. The legal body removed to the new site, and thenceforward were known by the name of the King's Inns. Possession of this property having been resumed by the government in 1742, and the present Four Courts erected thereon, a plot of ground at the top of Henrietta Street was purchased by the society, and the existing hall built in the year 1800. The library, numbering over 50,000 volumes, with a few MSS., is housed in buildings specially provided in the year 1831, and is open, not only to the members of the society, but also to strangers. The collection comprises all kinds of literature. It is based principally upon a purchase made in 1787 of the large and valuable library of Mr Justice Robinson, and is maintained chiefly by an annual payment made from the Consolidated Fund to the society in lieu of the right to receive copyright works which was conferred by an Act of 1801, but abrogated in 1836.

In discipline and professional etiquette the members of the bar in Ireland differ little from their English brethren. The same style of costume is enforced, the same gradations of rank—attorney-general, solicitor-general, king's counsel and ordinary barristers—being found. There are also serjeants-at-law limited, however, to three in number, and designated 1st, 2nd and 3rd serjeant. The King's Inns do not provide chambers for business purposes; there is consequently no aggregation of counsel in certain localities, as is the case in London in the Inns of Court and their immediate vicinity.

The corporation known as the *Faculty of Advocates* in Edinburgh corresponds with the Inns of Court in London and the King's Inns in Dublin (see ADVOCATES, FACULTY OF).

INNUENDO (Latin for "by nodding," from *innuere*, to indicate by nodding), an insinuation, suggestion, in prima facie innocent words, of something defamatory or disparaging of a person. The word appears in legal documents in Medieval Latin, to explain, in parenthesis, that to which a preceding word refers; thus, "he, *innuendo*, the plaintiff, is a thief." The word is still found in pleadings in actions for libel and slander. The innuendo, in the plaintiff's statement of claim, is an averment that words written or spoken by the defendant, though prima facie not actionable, have, in fact, a defamatory meaning, which is specifically set out (see LIBEL AND SLANDER).

INOUYE, KAORU, MARQUESS (1835–   ), Japanese statesman, was born in 1835, a *samurai* of the Chōshū fief. He was a bosom friend of his fellow-clansman Prince Ito, and the two youths visited England in 1863, serving as common sailors during the voyage. At that time all travel abroad was forbidden on pain of death, but the veto did not prove deterrent in the face of a rapidly growing conviction that, as a matter of self-protection, Japan must assimilate the essentials of Western civilization. Shortly after the departure of Inouye and Ito, the Chōshū fief, having fired upon foreign vessels passing the strait of Shimonoseki, was menaced by war with the Yedo government or with the insulted powers, and Inouye and Ito, on receipt of this news, hastened home hoping to avert the catastrophe. They repaired to the British legation in Yedo and begged that the allied squadron, then about to sail for Shimonoseki to call Chōshū to account, should be delayed that they might have an opportunity of advising the fief to make timely submission. Not only was this request complied with, but a British frigate was detailed to carry the two men to Shimonoseki, and, pending her departure, the British legation assisted them to lie *perdu.* Their mission proved futile, however, and Inouye was subsequently waylaid by a party of conservative *samurai*, who left him covered with wounds. This experience did not modify his liberal views, and, by the time of the Restoration in 1867, he had earned a high reputation as a leader of progress and an able statesman. Finance and foreign affairs were supposed to be the spheres specially suited to his genius, but his name is not associated with any signal practical success in either, though his counsels were always highly valued by his sovereign and his country alike. As minister of foreign affairs he conducted the long and abortive negotiations for treaty revision between 1883 and 1886, and in 1885 he was raised to the peerage with the title of count, being one of the first group of *Meiji* statesmen whose services were thus rewarded. Prior to his permanent retirement from office in 1898, he held the portfolios of foreign affairs, finance, home affairs, and agriculture and commerce, and throughout the war with Russia he attended all important state councils, by order of the emperor, being also specially designated adviser to the minister of finance. In 1907 he was raised to the rank of marquess. His name will go down in his country's history as one of the five *Meiji* statesmen, namely, Princes Ito and Yamagata, Marquesses Inouye and Matsukata and Count Okuma.

INOWRAZLAW, the Polish form of the German *Jung-Breslau*, by which the place was formerly known, a town in the Prussian province of Posen, situated on an eminence in the most fertile part of the province, 21 m. S.W. of Thorn. Pop. (1900) 26,141. Iron-founding, the manufacture of machinery and chemicals, and an active trade in cattle and country produce are carried on. In the vicinity are important salt works and a sulphur mine, and since 1876 a brine bath has been within the town. Inowrazlaw is mentioned as early as 1185, and in 1772 it passed to Prussia.

INQUEST (O. Fr. *enqueste*, modern *enquête*, from Lat. *inquisitum*, *inquirere*, to inquire), an inquiry, particularly a formal legal inquiry into facts. The word is now chiefly confined to the inquiry held by a coroner and jury into the causes of certain deaths, in matters of treasure trove, and, in the city of London, in cases of fires (see CORONER). Formerly the term was applied to many formal and official inquiries for fixing prices, &c.

INQUISITION, THE (Lat. *inquisitio*, an inquiry), the name given to the ecclesiastical jurisdiction dealing both in the middle ages and in modern times with the detection and punishment of heretics and all persons guilty of any offence against Catholic orthodoxy. It is incorrect to say that the Inquisition made its appearance in the 13th century complete in all its principles and organs. It was the result of, or rather one step in, a process of evolution, the beginnings of which are to be traced back to the origins of Christianity. St Paul (1 Tim.

Punishment of heresy in the Roman Empire.

i. 20) "delivered unto Satan" Hymenaeus and Alexander, "that they might learn not to blaspheme." The penalty of death by stoning inflicted by the book of Deuteronomy upon those who deserted the true faith (Deut. xiii. 6-9, xvii. 1-6) is thus reduced to a purely spiritual excommunication. During the first three centuries of the Church there is no trace of any persecution, and the earlier Fathers, especially Origen and Lactantius, reject the idea of it. Constantine, by the edict of Milan (313), inaugurated an era of official tolerance, but from the time of Valentinian I. and Theodosius I. onwards, laws against heretics began to appear, and increased with astonishing regularity and rapidity. We can count sixty-eight distributed over fifty-two years; heretics are subjected to exile or confiscation, disqualified from inheriting property, and even, in the case of a few groups of Manichaeans and Donatists, condemned to death; but it should be noticed that these penalties apply only to the outward manifestations of heresy, and not, as in the middle ages, to crimes of conscience.

Opinions of the Fathers.

Within the Church, St Optatus alone (*De schismate Donatistarum*, lib. iii. cap. iii.) approved of this violent repression of the Donatist heresy; St Augustine only admitted a *temperata severitas*, such as scourging, fines or exile, and at the end of the 4th century the condemnation of the Spanish heretic Priscillian, who was put to death in 385 by order of the emperor Maximus, gave rise to a keen controversy. St Martin of Tours, St Ambrose and St Leo vigorously attacked the Spanish bishops who had obtained the condemnation of Priscillian. St John Chrysostom considered that a heretic should be deprived of the liberty of speech and that assemblies organized by heretics should be dissolved, but declared that "to put a heretic to death would be to introduce upon earth an inexpiable crime."

In the early Middle Ages.

From the 6th to the 9th century the heterodox, with the exception of the Manichaean sects in certain places, were hardly subjected to persecution. They were, moreover, rare and generally isolated, for groups of sectaries only began to appear to any extent at the time of the earliest appearances of Catharism. However, at the end of the 10th century, the disciples of Vilgard, a heretic of Ravenna, were destroyed in Italy and Sardinia, according to Glaber, *ferro et incendio*, probably by assimilation to the Manichaeans. Perhaps this was the precedent for the punishment of the thirteen Cathari who were burnt at Orleans in 1022 by order of King Robert, a sentence which has been commonly quoted as the first action of the "secular arm" (or lay power) against heresy in the West during the middle ages. However that may be, after 1022 there were numerous cases of the execution of heretics, either by burning or strangling, in France, Italy, the Empire and England. Up till about 1200 it is not quite easy to determine what part was taken by the Church and its bishops and doctors in this series of executions. At Orleans the people, supported by the Crown, were responsible for the death of the heretics; the historians give only the faintest indications of any direct intervention of the clergy, except perhaps for the examination of doctrine. At Goslar (1051–1052) the proceedings were the same. At Asti (1034) the bishop's name appears side by side with those of the other lords who attacked the Cathari, but it seems clear that it was not he who had the chief voice in their execution; at Milan, it was again the civil magistrates, and this time against the wish of the archbishop—who gave the heretics the choice between the adoration of the cross and death. At Soissons (1114) the mob, distrusting the weakness of the clergy, took advantage of their bishop's absence to burn heretics at the stake. It was also the mob who, infuriated at seeing him destroy and burn crosses, burnt the heresiarch Peter of Bruis (*c.* 1140). At Liége (1144) the bishop saved from the flames certain persons whom the faithful were attempting to burn. At Cologne (1163) the archbishop was less successful, and the mob put the heretics to death without even a trial. The condemnation of Arnold of Brescia was entirely political, though he was denounced as a heretic to the secular arm by Bernard of Clairvaux, and his execution was the act of the prefect of Rome (1155). At Vézelay, on the contrary (1167), the heretics were burnt after ecclesiastical judgment had been pronounced by the abbot and several bishops. From 1183 to 1206 Hugh, bishop of Auxerre, took upon himself the discretionary power of exiling, dispossessing or burning heretics, while about the same time William of the White Hands, archbishop of Reims, in concert with Philip, count of Flanders, stamped out heresy from his diocese by fire. There was a similar unanimity between the lay and ecclesiastical authorities in the famous condemnation of the disciples of Amalric of Bena, who were burnt at Paris in 1209 by order of Philip Augustus after an ecclesiastical inquiry and judgment.

Conflicting views as to the punishment of heresy.

The theory in these matters was at first as uncertain as the practice; in the 11th century one bishop only, Theodwin of Liége (d. 1075), affirms the necessity for the punishment of heretics by the secular arm (1050). His predecessor, Wazo, bishop of Liége from 1041 to 1044, had expressly condemned any capital punishment and advised the bishop of Chalons to resort to peaceful conversion. In the 12th century Peter the Cantor[1] protested against the death penalty, admitting at the most imprisonment. It was imprisonment again, or exile, but not death, which the German abbot Gerhoh of Reichersperg (1093–1169) demanded in the case of Arnold of Brescia, and in dealing with the heretics of Cologne, St Bernard, who cannot be accused of leniency where heterodoxy was concerned, recommended pacific refutation, followed by excommunication or prison, but never the death penalty (see Bernard, St, of Clairvaux).

The Church Councils.

In the councils, too, it is clear that the appeal to the secular arm was equally guarded: at Reims (1049) excommunication alone is decreed against heretics; and when, as at Toulouse (1119) and the Lateran council (1139), it is laid down that heretics, in addition to excommunication, should be dealt with *per potestates exteras*, or when, as at the council of Reims (1148), the secular princes are forbidden to support or harbour heretics, there is never any suggestion of capital punishment.

Influence of the Canon Law.

But it must be noticed that from the opening years of the 12th century date the beginnings of a decided evolution in the canon law, continuing up to the time of Innocent III., which substituted for arbitrary decisions according to circumstances an organized and particularized legislation, in which judgment was given *secundum canonicas et legitimas sanctiones*. Anselm of Lucca and the *Panormia* attributed to Ivo of Chartres reproduced word for word under the rubric *De edicto imperatorum in dampnationem hoereticorum*, law 5 of the title *De hereticis* of Justinian's code, which pronounces the sentence of death against the Manichaeans; and we should remember that the Cathari, and in general all heretics in the West in the 11th and 12th centuries were considered by contemporary theologians as Manichaeans. Gratian in the *Decretum* proclaims the views of St Augustine (exile and fines). Certain of his commentators (*2ª pars Caus.* xxiii.), and notably Rufinus Johannes Teutonicus, and the anonymous glossator (in Uguccio's Great Summa of the *Decretum*) declare that impenitent heretics may, or even should, be punished by death.

The Council of Tours, 1163.

As early as 1163, the council of Tours suggested to the ecclesiastical authorities definite penalties to be inflicted on heretics, namely, imprisonment and loss of all their property.

Definition of the procedure under Lucius III and the Emperor Frederick I.

Pope Alexander III., who had attended the council of Tours of 1163, renewed at the Lateran council (1179) the decisions which had already been made with regard to the heterodox in the south of France, and at Verona in 1184 Pope Lucius III., in concert with the emperor Frederick Barbarossa, took still more severe measures: obstinate heretics were to be excommunicated, and then handed over to the secular arm, which would inflict a suitable penalty. The emperor, on his side, laid them under the imperial ban (exile, confiscation, demolition of their houses, *infamia*, loss of civil rights, disqualification from

[1] Pierre de Beauvoisis (?), choir-master (*grand-chantre*) of the university of Paris (1184), bishop of Tournai (1191), of Paris (1196); died as a Cistercian in 1197. He was beatified.

public offices, &c.). The usage, then, was already quite clear; but the death penalty had not as yet been demanded or inflicted.

The death penalty.

Possibly it was Count Raymond V. of Toulouse, in whose territories heretics abounded, who in 1194 enacted a law threatening them with the penalty of death; but the authenticity of this act has been questioned. It was more probably Peter II. of Aragon who was the first to decree, in 1197, the punishment of death by burning against the heretics who should not have left his kingdom within a given time.

Innocent III.

But it was Innocent III. who gave the most powerful impetus to the anti-heretical movement in the secular world by his frequent exhortations (beginning in 1198) to the secular princes (letters of March 25th, 1199, and September 22nd, 1207). As a jurist he henceforward assimilated the crime of high treason against God to that of high treason against temporal rulers, and admitted all the terrible consequences of this assimilation.

It is therefore incorrect to believe that the Inquisition arose out of, and at the time of, the crusade against the Albigenses.

Albigensian Crusade. No regular Inquisition.

These executions *en masse* certainly created a definitive precedent for violent repression, but there was still no regular organization: the council of Toulouse, held in November 1229 by the Roman legate after the treaty of peace, attempted to organize one, and constituted itself the tribunal. But the procedure was still uncertain; in the north, from 1200 to 1222, at Paris (execution of the disciples of Amalric of Bena), at Strassburg, Cambrai, Troyes and Besançon executions took place, after trials in which the bishops were the judges, the exercise of the secular power being based on vague phrases in the decrees of Louis VIII. (that heretics be punished *animadversione debita*), or in those of Louis IX., ordering his *baillis* or barons to do to them *quod debebunt*.

The Emperor Frederick II.

The emperor Frederick II. defined his jurisprudence more clearly: from 1220 to 1239, supported by Pope Honorius III., and above all by Gregory IX., he established against the heretics of the Empire in general a legislation in which the penalties of death, banishment and confiscation of property were formulated so clearly as to be henceforth incontestable.

Gregory IX. creates the monastic Inquisition.

Gregory IX. felt his influence, and also that of the Dominican Guala, bishop of Brescia, who had subjected his episcopal town to the full rigour of the imperial laws. The pope no longer hesitated as to the principle or the degree of repression; but introduced new methods of inquiry and judgment: he created out of the material furnished him by the mendicant orders, and especially the Dominicans, who were more disciplined than the rest and better theologians,

The Dominicans.

the monastic inquisition, which was more elastic, more constant in its activities and more numerous than the inquisition by legate, and better disciplined than the episcopal inquisition. In November 1232 the Dominican Alberic went round Lombardy with the title of *Inquisitor haereticae pravitatis*. In 1231 a similar commission was given to the Dominicans of Friesach and to the terrible Conrad of Marburg, whose zeal in Germany even exceeded the pope's wishes. In 1233 Gregory IX. addressed a letter to the bishops in the south of France, in which he announced his intention of employing the preaching friars in future for the discovery and repression of heresy.

The inquisition was now regularly instituted, but its jurisprudence was elaborated by successive additions or limitations, by the force of custom and the detailed prescriptions added by the papal constitutions.

Beginnings of the Inquisition.

The pope's commissioners "in the matter of heresy" at first travelled from place to place. On arriving in a district they addressed its inhabitants, called upon them to confess, if they were heretics, or to denounce those whom they knew to be heretics: a "time of grace" was opened, during which those who freely confessed were dispensed from all penalties, or only given a secret and very light penance; while those whose heresy had been openly manifested were exempted from the penalties of death and perpetual imprisonment. But this time could not exceed one month. After that began the inquisition. As soon as their mission was at an end, and heresy was considered to be stamped out, the inquisitors left the country.

Inquisitorial districts.

Later, inquisitorial districts were formed. The seat of the Inquisition in each district was the monastery of the order (Dominican or Franciscan) to which the inquisitors for that part belonged. There was never any special court or prison: the *murus* (prison) was lent to the Inquisition by the ecclesiastical or secular authorities. The maintenance of the prisoners and the duty of providing the prison fell in principle upon the bishops (council of Toulouse, 1229), but they tried to evade it. The kings of France, and in particular Louis VIII., granted subsidies to the inquisitors.

The inquisitors and their auxiliaries.

For each district the inquisitors were chosen by the provincials of their order, approved or rejected by the pope, and removable by him only. Their discretionary powers were absolute. They conducted their interrogations before two persons (laymen or ecclesiastics) and only pronounced their sentence after consultation with leading men in the district (*communicato bonorum virorum consilio*). This was the only protection for the accused. It was in vain that the civil lawyers tried to prove that the secular authorities had a right to see the documents bearing on the case; the Inquisition always succeeded in setting aside these claims. The share taken in the proceedings by the bishops, the accused or their representatives, though admitted in principle, was as a rule merely illusory. The Inquisition had in addition to these *boni viri* certain other lay assistant officials, its sworn notaries, messengers and familiars, all of whom were closely bound to it.

Bernard Guy (Bernardus Guidonis),[1] one of the earliest and most complete exponents of the theory of the Inquisition, admits distinctly that in its procedure *multa sunt specialia*.

Procedure of the Inquisition.

The procedure was secret and in the highest degree arbitrary, proceeding *sine strepitu et figura judicii*, its object being to ascertain not so much particular offences as tendencies: the murderers of the inquisitor Peter Martyr[2] were tried, not as assassins, but as guilty of heresy and adversaries of the Inquisition; and on the other hand, external acts of piety and verbal professions of faith were held of no value. Moreover the Inquisition was not bound by the ordinary rules of procedure in its inquiries: the accused was surprised by a sudden summons, and as a rule imprisoned on suspicion. All the accused were presumed to be guilty, the judge being at the same time the accuser. Absence was naturally considered as contumacy, and only increased the presumption of guilt by seeming to admit it. The accused had the right to demand a written account of the offences attributed to him (*capitula accusationis*), but the names of the witnesses were withheld from him (Innocent IV.; bulls *Cum negocium* and *Licet sicut accepimus*), he did not know who had denounced him, nor what weight was attached by the judges to the denunciations made against him. The utmost that was allowed him was the unsatisfactory privilege of the *recusationes divinatrices*, *i.e.* at his first examination he was asked for the names of any enemies of whom he knew, and the causes of their enmity. Heretics or persons deprived of civil rights (*infames*) were admitted as witnesses in cases of heresy. Women, children or slaves could be witnesses for the prosecution, but not for the defence, and cases are even to be found in which the witnesses were only ten years of age. Langhino Ugolini states that a witness who should retract his hostile evidence should be punished for false witness, but that his evidence should be retained, and have its full effect on the sentence. No witness might refuse to give evidence, under pain of being considered guilty of heresy. The prosecution went on in the utmost secrecy. The accused swore that he would tell the whole truth, and was bound to denounce all those

[1] He was born *c.* 1261, was a Dominican at Limoges in 1279, successively prior of Albi (1294), Carcassonne (1297), Castres (1301) and Limoges (1305), inquisitor at Toulouse (1307), bishop of Tuy (1323) and of Lodève (1325). He died in 1331.

[2] Peter, a Dominican, born at Verona, was murdered near Milan in 1252 and canonized in 1253.

who were partners of his heresy, or whom he knew or suspected to be heretics. If he confessed, and denounced his accomplices, relatives or friends, he was "reconciled" with the Church, and had to suffer only the humiliating penalties prescribed by the canon law. If further examination proved necessary, it was continued by various methods. Bernardus Guidonis enumerates many ways of obtaining confessions, sometimes by means of moral subterfuges, but sometimes also by a process of weakening the physical strength. And as a last expedient torture was resorted to. The Church was originally opposed to torture, and the canon law did not admit confessions extorted by that means; but by the bull *Ad extirpanda* (1252) Innocent IV. approved its use for the discovery of heresy, and Urban IV. confirmed this usage, which had its origin in secular legislation (cf. the Veronese Code of 1228, and Sicilian Constitution of Frederick II. in 1231). In 1312 excessive cruelty had to be suppressed by the council of Vienna. Canonically the torture could only be applied once, but it might be "continued." The next step was the torture of witnesses, a practice which was left to the discretion of the inquisitors. Moreover, all confessions or depositions extorted in the torture-chamber had subsequently to be "freely" confirmed. The confession was always considered as voluntary. The procedure was of course not litigious; any lawyer defending the accused would have been held guilty of heresy. The inquiry might last a long time, for it was interrupted or resumed according to the discretion of the judges, who disposed matters so as to obtain as many confessions or denunciations as possible. After the different phases of the examination, the accused were divided into two categories: (1) those who had confessed and abjured, (2) those who had not confessed and were consequently convicted of heresy. There was a third class, by no means the least numerous, namely, those who having previously confessed and abjured had relapsed into error. Next came the moment of the sentence: "there was never any case of an acquittal pure and simple" (H. C. Lea). The formula for full and complete acquittal given by Bernardus Guidonis in his *Practica*, should, he says, never or very rarely be employed. The sentences were solemnly pronounced on a Sunday, in a church or public place, in the presence of the inquisitors, their auxiliaries, the bishops, the secular magistrates and the people. This was the *sermo generalis* (see AUTO DA FÉ). The accused who had confessed were reconciled, and the penalties were then pronounced; these were, in order of severity, penances, fasting, prayers, pilgrimages (Palestine, St James of Compostella, Canterbury, &c.), public scourging, the compulsory wearing on the breast or back of crosses of yellow felt sewn on to the clothes or sometimes of tongues of red, letters, &c. These were the *poenae confusibiles* (humiliating). The inquisitors eventually acquired the right of inflicting fines at discretion. In 1244 and 1251 Innocent IV. reproved them for their exactions. All these minor penalties could be commuted for payments in money in the same way as absolution from the crusader's vow, and the council of Vienna tried to put an end to these extortions. Beyond these minor penalties came the severer ones of imprisonment for a period of time, perpetual imprisonment and imprisonment of various degrees of severity (*murus largus, murus strictus vel strictissimus*). The *murus strictus* consisted in the deepest dungeon, with single or double fetters, and "the bread and water of affliction"; but the severity of the prison régime varied very much. The *murus largus*, especially for a rich prisoner, amounted to a fairly mild imprisonment, but the mortality among those confined in the *murus strictus* became so high that Clement V. ordered an inquiry to be made into the prison régime in Languedoc, in spite of Bernard Guy's protest against the investigation as likely to diminish the prestige of the inquisitors. After the sentences had been pronounced, the obstinate heretics and renegades were for the last time called upon to submit and to confess and abjure. If they consented, they were received as penitents, and condemned on the spot to perpetual imprisonment; if they did not consent, they were handed over to the secular arm. When the heretic was handed over to the secular arm, the agents of the secular power were recommended to punish him *debita animadversione*, and the form of recommending him to mercy was gone through. But, as M. Vacandard says, "If the secular judges had thought fit to take this formula literally, they would soon have been brought back to a recognition of the true state of affairs by excommunication." In effect, handing over to the secular arm was equivalent to a sentence of death, and of death by fire. The Dominican Jacob Sprenger, provincial of his order in Germany (1494) and inquisitor, does not hesitate to speak of the victims *quas incinerari fecimus* ("whom we [the inquisitors] caused to be burnt to ashes"). But we must accept the conclusions of H.C. Lea and Vacandard that comparatively few people suffered at the stake in the medieval Inquisition. Between 1308 and 1323, Bernard Guy, who cannot be accused of inactivity, only handed over to the secular arm 42 persons, out of 930 who were convicted of heresy.

Use of torture.

Punishments.

"Handing over to the secular arm."

From the point of view of jurisprudence of the Inquisition, the confiscation of the condemned man's property by the ecclesiastical and secular powers is only the accompaniment to the more severe penalties of perpetual imprisonment or death; but from the point of view of its economic history the importance of the confiscation is supreme. The practice originated in the Roman law, and all secular princes had already, in their own interest, recognized it as lawful (Frederick Barbarossa, Decree of Verona; Louis VIII., ordinances of 1226, 1229; Louis IX., ordinance of 1234; Raymond VII. of Toulouse, &c.). In the kingdom of France there was a special official, the *procureur des encours* (confiscation in the matter of heresy), whose duty it was to collect the personal property of the heretics, and to incorporate their landed estates in the royal domain; in Languedoc crying abuses arose, especially under the reign of Alphonse of Poitiers. Soon the papacy managed to gain a share of the spoils, even outside the states of the Church, as is shown by the bulls *ad extirpanda* of Innocent IV. and Alexander IV., and henceforward the inquisitors had, in varying proportions, a direct interest in these spoliations. In Spain this division only applied to the property of the clergy and vassals of the Church, but in France, Italy and Germany, the property of all those convicted of heresy was shared between the lay and ecclesiastical authorities. Venice alone decided that all the receipts of the Holy Office should be handed over in full to the state. Clement V., in his attempted reform and regularization of inquisitorial procedure, endeavoured to reduce the confiscations to a fairly reasonable minimum, and in 1337–1338 a series of papal inquiries was held into this financial aspect of the matter. The Assize of Clarendon, the Constitutions of Frederick II. (1232) and of Count Raymond of Toulouse (1234) had also come to a joint decision with the councils on this question. King Charles V. of France prevailed upon the papacy to abolish this regulation (1378). Confiscation was, indeed, most profitable to the secular princes, and there is no doubt that the hope of considerable gain was what induced many princes to uphold the inquisitorial administration, especially in the days of the decay of faith. The resistance of the south of France to the Capetian monarchs was to a large extent broken owing to the decimation of the bourgeoisie by the Inquisition and their impoverishment by the extortions of the *encours*. The same was the case in certain of the Italian republics; while in districts such as the north of France, where heretics were both poor and few and far between, the Inquisition did not easily take root, nor did it prove very profitable. These confiscations, the importance of which in the political and economic history of the middle ages was first shown fully by H. C. Lea, were a constant source of uncertainty in transactions of all kinds; there was, for instance, always a risk in entering into a contract in a place where the existence of heretics was suspected, since any contract entered into with a heretic was void in itself. Nor was there any more security in the transmission of inheritances for posthumous trials were frequent;

Punishment by confiscation of goods.

Abuse of the system.

Economic and political importance of the system.

the *Liber sententiarum inquisitionis* of Bernardus Guidonis (1307–1323) records sentences pronounced after death against 89 persons during a period of 15 years. But not only was their property confiscated and their heirs disinherited; they were subject to still further penalties. Frederick II. extended to heresy the application of the Roman law disqualifying from holding office, and even included under its operation the children and grandchildren of the guilty man. Alexander IV. and Boniface VIII. lightened the severity of this law, and removed certain disqualifications, notably in the case of ecclesiastical offices and property.

Condemnation of books. Among other accessory penalties, we must notice the condemnation of books. There were many precedents for this: Constantine had had the Arian writings burnt, Theodosius II. and Valentinian III. those of the Nestorians and Manichaeans, Justinian the Talmud. In 1210 were burnt the books of David of Dinant and the *Periphyseon* of Aristotle. In 1255 the *De periculis novissimorum temporum* of William of St Amour[1] was burnt by order of Pope Alexander IV., and from 1248 to 1319 was pronounced a series of condemnations of the Talmud. Nicholas Eymerich (*c.* 1320–1399), the Spanish inquisitor, demanded from Pope Gregory XI. the condemnation of Raymond Lully's books, and in 1376 obtained it, but before long the Lullists returned into favour with the pope and Eymerich was banished. This rebuff suffered by an inquisitor shows how uncertain the censure of books still was, even in a country where in less than two centuries' time it was to become one of the chief spheres of inquisitorial activity.

Sorcery and magic. The definite object of the Inquisition was the prosecution of heresy; but its sphere of action was gradually extended by the theologians and casuists until sorcery and magic ranked with dogmatic heresy. The council of Valence (1248) dealt with sorcerers as well as sacrilegious persons, but did not treat them as heretics. Alexander IV. went further, declaring that divination and sorcery should only come within the competence of the inquisitor when they directly affected the unity or faith of the Church (9th December 1257; cf. bull *Quod super nonnullis*, 10th January 1260). Cases of simple sorcery were left to be dealt with by the ordinary judges. The distinction was very subtle, but it was not tampered with until 1451, at which date Nicholas V. gave the inquisitor Hugues Lenoir the cognizance of cases of divination, even when the crime did not savour of heresy. In dealing with such a subtle question, great variations had naturally arisen in practice, and the repression of sorcery was carried on jointly by the inquisitors, the bishops and the secular courts. John XXII., in consequence of a perfect epidemic of sorcery about 1320, handed over to the inquisitors for a time (1320–1333) all cases of crimes involving magic; but this measure was temporary and exceptional and only confirms the rule. There were various occasions during the middle ages when men's minds became infatuated, and it seemed as if the scourge of magic were likely entirely to destroy the Catholic faith; and during such times, morbidly infected with fear and the spirit of persecution, the ecclesiastical judges regained all their prestige. One of these crises culminated in the affair of the "Vauderie"[2] of Arras (1459), in which twelve unfortunates perished at the stake; and there were similar occurrences at the same period in Dauphiné and Gascony; of this nature again was the violent persecution in the Germanic countries begun by the bull *Summis desiderantes* of Innocent VIII. (5th December 1484), in the course of which the two authors of the *Malleus maleficorum*, the inquisitors Sprenger and Institoris (Heinrich Krämer), distinguished themselves as much by their knowledge of theoretical demonology as by their zeal as persecutors. In France the secular authority was not long in claiming and obtaining jurisdiction over sorcerers (parlement of Paris, 1374), and as early as 1378 the university of Paris gave judgment in a case of demonology. Those unfortunates who were charged with sorcery gained, however, nothing by this change of jurisdiction, for they were invariably put to death.

The Inquisition and the Jews. The inquisitors could not take proceedings against Jews as such. They might profess their religion and observe its rites without being in a state of heresy; they were only heretic when they attacked the Christian faith or community, made proselytes, or returned to Judaism after being converted. Further, those who practised usury were "suspected of not holding very orthodox doctrine as to theft" (Vacandard), and on this account the Inquisition gained a hold on them. Pope Martin V. (6th November 1419) authorized inquisitors to take proceedings against usurers.

Treatment of heresy in the various countries. But these are merely extensions of competence resulting from the works of the casuists; the Inquisition was primarily the instrument for the repression of all kinds of breaches of orthodoxy. Its work in this capacity we will now describe in outline for each of the great countries of medieval Christendom. England, whether before or after the establishment of the Inquisition, had but few trials for heresy and, particularist in this as in all her religious activity, judged them according to her own discipline, without asking Rome for laws or special judges.

England. In 1166, a few heretics having been apprehended, Henry II. called a council at Oxford and summoned them to appear before it; they all confessed, and were condemned to be scourged, branded on the face with the mark of a key, and expelled from the country, and by the 21st article of the Assize of Clarendon the king forbade any one to harbour on their lands or in the house any "of that sect of renegades who had been excommunicated at Oxford." Any one offending against this law was to be "at the king's mercy" and his house was to be "carried outside the town and burnt." The sheriffs were obliged to swear observance of this law and to require a similar oath from all barons' stewards, knights and free tenants. This was the first civil law against heresy since the end of the Roman empire, and preceded the famous rescripts of Frederick II. against sectaries in the 13th century. It should, however, be noted that the political acts of Henry II. and Frederick II. drew down the most explicit condemnation of the church. Orthodoxy remained almost unimpaired in England up till the time of Wycliffe. Apparently neither the Catharist, Waldensian nor Pantheistic heresies gained any footing in Great Britain. The affair of the Templars in France, which was quite political, was repeated in England: Clement V. having ordered their arrest, Edward II., after much hesitation, gave orders to the sheriffs to execute it and then decided that the *ecclesiastical law* should be applied. The papal inquisitors sent to England met with a bad reception, and the pope was obliged to forbid them to use torture, which was contrary to the laws of the kingdom. It was found impossible to establish the Templars' guilt and only canonical penalties were inflicted on them. The rising of the Lollards having alarmed both the church and the state, the article *De haeretico comburendo* was established by statute in 1401, and gained a melancholy notoriety during the religious struggles of the 16th century; it seems to have been not so much a measure for the safeguarding of dogma as a violent assertion of the secular absolutism. It was not till 1676 that Charles II. caused it to be abrogated, and obtained a decision that in cases of atheism, blasphemy, heresy, schism and other religious offences, the ecclesiastical courts should be confined to the penalties of excommunication, removal from office, degradation and other ecclesiastical means of censure, to the exclusion of the death penalty.

Scotland. Scotland was much later than England in giving up persecution and bloodshed; and so late as 1687 a student of medicine aged eighteen and named Hikenhead was accused of heresy and hanged at Edinburgh. In Ireland Richard de Lederede or Ledred, a Franciscan and bishop of Ossory, in 1324 prosecuted on suspicion of heresy and for sorcery a certain Dame Alice

[1] Guillaume de St Amour (d. 1272), named after his birthplace in the Jura, was canon of Beauvais and rector of the university of Paris. He was conspicuous as the mouthpiece of the secular clergy in their attacks on the mendicant orders, the Dominicans in particular.

[2] The name of *vauderie*, *i.e.* the Vaudois or Waldensian heresy, had come to be used of witchcraft.

Kettle or Kyteler and her accomplices, Petronilla of Meath and her daughter Bassilla, who were accused of holding "nightly conference with a spirit called Robert Artisson, to whom she sacrificed in the high way nine red cocks and nine peacocks' eyes." The lady had powerful connexions, and her brother-in-law, Arnold le Powre, seneschal of Kilkenny, even went so far as to imprison the bishop. But in spite of the refusal of the secular authorities to co-operate with him, the bishop was strong enough to force them in 1325 to burn some of the accused. Dame Kettle herself, however, who had been cited to appear at Dublin before the dean of St Patrick's, escaped with the assistance of some of the nobles to England. Meanwhile the bishop, who had attempted to involve Arnold le Powre in the same charge, became involved in a quarrel with the administrators of the English government in Ireland; counter charges were brought against him, he was excommunicated by his metropolitan, Alexander de Bicknor, archbishop of Dublin; and in defiance of the king's commands, after publishing counter charges against the archbishop, he appealed to Rome and left the country. In 1335 Benedict XII. wrote to Edward III. deploring the absence of any inquisition in the king's dominions, and exhorting him to lend the aid of the secular arm in repressing heresy. Archbishop Alexander, who in 1347 was denounced as an abettor of heresy, died in 1349, and his successor was ordered to chastise those heretics who had taken refuge in the diocese from Richard de Lederede's violence, and whom his predecessor had protected. Finally, in 1354, Richard de Lederede himself was allowed to return to his diocese, where his zeal for persecution does not, however, seem to have found much further scope. He died in 1360.

Ireland.

The scene of the activities of the monastic Inquisition in France lay chiefly in the south. The repression of the Albigensian heresy (see ALBIGENSES) went on even when its importance had quite disappeared. The chronicle of the inquisitor Guilhem Pelhisso (d. 1268) shows us the most tragic episodes of the reign of terror which wasted Languedoc for a century. Guillaume Arnaud, Peter Cella, Bernard of Caux, Jean de St Pierre, Nicholas of Abbeville, Foulques de St Georges, were the chief of the inquisitors who played the part of absolute dictators, burning at the stake, attacking both the living and the dead, confiscating their property and land, and enclosing the inhabitants both of the towns and the country in a network of suspicion and denunciation. The secular authorities were of the utmost assistance to them in this task; owing to the confiscations, the crown had too direct an interest in the success of the inquisitorial trials not to connive at all their abuses. Under the regency of Alphonse of Poitiers Languedoc was regularly laid under contribution by the *procureur des encours*. There were frequent attempts at retaliation, directed for the most part against the inquisitors, and isolated attacks were made on Dominicans. In 1234–1235 there were regular risings of the people at Albi and Narbonne, which forced the inquisitors to retreat. In 1235 the inquisitors were driven out of Toulouse. These risings were followed by terrible measures of repression, which, in turn, led to violent outbreaks on the part of the relatives, friends or compatriots of the sufferers. During the night of the 28th or 29th of May 1242 the inquisitors and their agents were massacred at the castle of Avignonet. This massacre led to a persecution which went on without opposition and almost without a lull for nearly fifty years. At the beginning of the 14th century the terrified people found a defender in the heroic Franciscan Bernard Délicieux. For a moment King Philip the Fair and Pope Clement V. seemed to interest themselves in the misfortunes of Languedoc, and the king of France sent down reformers; but they had no effect, their activity being restrained by the king himself, who was alarmed at a separatist movement which was arising in Languedoc. The work of repression which followed this moment of hope was carried out, between 1308 and 1323, by the inquisitor Bernard Guy, and completed the destruction of the Catharist heresy, the appearances of which after the middle of the 14th century became less and less frequent. Other heretics, for a time at least, took their place, namely the Spirituals, who had developed out of a branch of the Franciscans, and were remotely disciples of Joachim, abbot of Floris (*q.v.*), and whom their rigid rule of absolute poverty led, by a reaction against the cupidity of the ordinary ecclesiastics, to repudiate any hierarchy and to uphold the doctrines of Peter John de Oliva against the word of the pope. On the 17th of February 1317 John XXII. condemned all these irregular followers of St Francis, "*fraticelli, fratres de paupere vita, bizochi* or *beghini*," and the Inquisition of Languedoc was at once set in motion against them. Four *spirituales* were burnt at Marseilles in 1318, and soon the persecution was extended to the Franciscan *beguins* or *tertiarii*, many people being burnt about 1320 at Narbonne, Lunel, Béziers, Carcassonne, &c. The persecution stopped for lack of an object, for the small groups of beguins were soon destroyed, and those of the *Spirituales* who were not sent to the stake or to prison were compelled by the papacy to enter other orders than the Franciscan. The Waldenses (*q.v.*) were more difficult to destroy: originally less dangerous to the church than the Cathari, they resisted longer, and their dispersal in scattered communities aided their long resistance.

France.

In the north of France the workings of the Inquisition were very intermittent; for there were fewer heretics there than in the south, and as they were poorer, there was less zeal on the part of the secular arm to persecute them. At its outset, however, the Inquisition in the north of France was marked by a series of melancholy events: the inquisitor Robert le Bougre, formerly a Catharist, spent six years (1233–1239) in going through the Nivernais, Burgundy, Flanders and Champagne, burning at the stake in every place unfortunates whom he condemned without a judgment, supported as he was by the ecclesiastical authorities and by princes such as Theobald of Champagne. The pope was forced to put a check on his zeal, and, after an inquiry, condemned him to imprisonment for life. We know that there were inquisitors settled in Île de France, Orléanais, Touraine, Lorraine and Burgundy during the 12th century, but we know next to nothing of what they did. In the 14th century, the Flemish and German heresies of the Free Spirit made their appearance in France; in 1310 a heretic named Marguerite Porette was burnt at Paris, and in 1373 another named Jeanne Daubenton, both of whom seem to have professed a kind of rudimentary pantheism, the latter being the head of a sect called the Turlupins. The Turlupins reappeared in 1421 at Arras and Douai and were persecuted in a similar way. But in the 15th century, with the exception of a few condemnations aimed against the Hussites, the Inquisition acted but feebly against heresy, which, as in the famous case of the "Vauderie" of Arras, was often nothing but fairly ordinary sorcery.

From the middle of the 14th century onward, the parlement had taken upon itself the right of hearing appeals from persons sentenced by the Inquisition. And the University again, by its faculty of theology, escaped the jurisdiction of the Inquisition. It was these two great bodies which at the time of the Reformation took the place of the Inquisition in dealing with heresy.

In Italy heresy not infrequently took on a social or political character; it was sometimes almost indistinguishable from the opposition of the Ghibellines or the communalist spirit of independence. Lombardy, besides a number of Cathari, contained a certain number of vaguely-defined sects against whom the efforts of the Apostolic Visitors sent by Innocent III. were not of much effect. From the very earliest days of the Inquisition, John of Vicenza, Roland of Cremona and Rassiero Sacchoni directed their persecutions against Lombardy, and especially against Milan. St Peter Martyr, who was conspicuous for his bigoted violence, was assassinated in 1252. On the 20th of March 1256 Alexander IV. ordered the provincial of the friar preachers of Lombardy to increase the number of inquisitors in that province from four to eight. At Florence both heresy and Ghibellinism were alike crushed by the terrible severities of Fra Ruggieri, and indulgences were promised to all who should aid in the extinction of heresy in

Italy.

Tuscany. Certain districts revolted against this violence, which threatened to devastate Italy as it had devastated Provence; in 1277 Fra Corrado Pagano was killed on an expedition against the heretics of the Vattelline, and two years after the people of Parma rose against the inquisitors. Besides, this reign of terror only raised to a furious pitch the passionate and independent piety of the Italian peoples. The body of a heretic, Armanno Ponzilupo, who was killed at Ferrara in 1269, was venerated by the people, and his mediation was even invoked, until the Inquisition had to suppress this cult. But it had a harder struggle against the successes of Gerard Legarelli, and especially Dolcino (see APOSTOLICI), which only came to an end after a long and difficult trial of the adepts of the Messianist sect of Guglielma, some of whom belonged to the noble families of Lombardy. Up till the beginning of the 14th century, however, the power of the Inquisition steadily increased, and at this period Zanghino Ugolini appeared as the most skilful exponent of its theory and procedure. About the same time Charles of Anjou introduced the Inquisition into the Two Sicilies, but it could rarely effect anything there; the religious cohesion of the country was weak, and refugees were sure of safe hiding, both Waldenses and Fraticelli being frequently harboured there. When Sicily passed into the hands of Peter III. of Aragon, moreover, it came into a position of open hostility to the Holy See and became a refuge for heretics.

Venice always preserved its autonomy as regards the repression of heresy; she was perfectly orthodox, but remained entirely independent of Rome; Innocent IV. sent inquisitors there, but the heretics continued actually to be subject to the secular tribunals. In 1288 a compromise was arrived at, and the papal Inquisition was admitted into the republic, but only on condition that it should remain under the control of the secular power; thus there was established a mixed régime which survived till the last days of the Venetian state. In Savoy the Inquisition constantly carried on severe measures against the Waldenses of the Alps. During the 14th and 15th centuries there was an uninterrupted succession of trials.

States of the Church.

As regards the papal states, "it was in the nature of things that, by a confusion of the two personages, the pope should consider all opposition to him *qua* Italian prince as resistance offered to the head of the church, *i.e.* to the church" (Ch.V. Langlois). The Colonna had a personal animosity against the Gaetani; therefore Boniface VIII., a Gaetano, declared the Colonna to be heretics. Rienzi was accused of heresy for having questioned the temporal sovereignty of the pope at Rome. The Venetians, who in 1309 opposed the annexation of Ferrara by Clement V. to the detriment of the house of Este, were proclaimed heretics and placed under the ban of Christendom. Savonarola was attacked because he interfered with the policy of Alexander VI. at Florence. It was this same desire for the hegemony of Italy which inspired the attitude of the popes throughout the middle ages, causing them to excommunicate, apparently without reason so far as doctrine was concerned, the Visconti of Milan, the Della Scala of Verona, the Maffredi of Faenza, &c., and prompting them to lay under an interdict or preach a crusade against certain rebellious great towns (Clement V. against Venice, John XXII. against Milan). Further, in each of the great cities of Lombardy and Tuscany, the papal party directed the local inquisition, and this power was rarely abused.

Germany.

In Germany heresies, especially of a mystical character, were numerous in the middle ages; some of them affected the mass of the people, and led to religious and social movements of no little importance. The repression of heresy went on by fits and starts, and the Inquisition was never exercised so regularly in the Germanic as in certain of the Latin countries. At the outset of the 13th century persecutions of the Waldenses and Ortlibarii (followers of Ortlieb of Strassburg, *c.* 1200) took place at Strassburg; measures were taken locally until, in 1231, Gregory IX. issued definite instructions to the German prelates with a view to a regular repression of heresy, and gave full powers to execute them to Conrad of Marburg. Certain nobles having offered him resistance, he preached a crusade against them, but died by the hand of an assassin. The council of Mainz (April 1234) dealt gently with Conrad's murderers, but severely with the false witnesses whom he had employed. Shortly before (February 1234), the diet of Frankfort had decided, in spite of the pope's injunctions, that the destruction of heresy should be entrusted to the ordinary magistrates. And besides, thanks to the struggle between the Empire and the papacy, the German prelates always limited the prerogatives of the papal Inquisition. Again, by the municipal laws of the north (*Sachsenspiegel*) the ecclesiastical jurisdiction in the matter of heresy was very much limited, while the *Schwabenspiegel* (municipal laws for southern Germany) does not seem to be aware of the existence of any inquisitional jurisdiction or procedure. When in the 14th century communities of Beghards developed with extraordinary rapidity, it was the episcopal authority, both at Cologne and Strassburg, which undertook to deal with these groups of sectaries, and at the very height of the conflict between the Empire and the papacy. Marsilius of Padua, the theoretical exponent of the imperial rights, attributes to the secular judge the right and obligation to punish heresy, the priest's rôle being merely advisory. In 1353 Innocent VI. tried to implant the papal Inquisition in Germany once for all; its success was but short, and Urban V.'s attempt in 1362 succeeded little better, in spite of the fact that Charles IV. (edicts of Lucca, June 1369) gave him the support of the secular power. Towards 1372, however, Gregory XI. succeeded in regularizing the exercise of the powers of the papal inquisitors on German soil; and the latter, notably Kerlinger, Hetstede, &c., set to work to destroy the communities of the Beghards, to burn their books, to close those *beguinages* which were under suspicion, and to check by more or less violent means mystical epidemics such as those of the "flagellants," "dancers," &c. But these measures provoked angry protests from the people, the secular magistrates and even the bishops, so that Gregory XI., perceiving that he was face to face with the popular party, invited the bishops to control the inquiries of his own envoys. At the end of the 15th century the two inquisitions were acting concurrently.

Bohemia.

In Bohemia and the provinces subject to it the Waldenses had found their chosen country, and by the middle of the 13th century their propaganda was very flourishing. In 1245 Innocent IV. ordered the bishops to prosecute them with the aid of the secular arm, and in 1257, at the request of King Přemysl Ottokar II., Alexander IV. introduced the Inquisition into Bohemia. But from this date till 1335 inquisitorial missions succeeded one another without effecting any sensible diminution in the material and moral strength of the heresy. The Waldenses had been joined by other sectaries, the Luciferani, and especially the Brethren of the Free Spirit. It was in vain that the bishops of Bohemia and Silesia carried on during the second half of the 14th century an active campaign against heresy; the spirit of criticism which had arisen with regard to the morals, and even to the dogmas of the church, was already preparing the way for Hussitism.

The Balkan States.

In the regions east of the Adriatic, Catharism, the first communities of which had very probably settled here, was supreme in the time of Innocent III. and Honorius III. The first Dominicans who established themselves in these parts had much to suffer from the aggression of those very heretics whom they had come to convert. Gregory XI., implacable in his persecution of Catharism, preached a crusade against them in 1234, and Bosnia was laid waste by fire and sword. But in spite of these violent measures Catharism only gained strength in the churches of Bulgaria, Rumania, Slavonia and Dalmatia. In 1298 Boniface VIII. tried to organize the Inquisition there, but the project remained fruitless. The attempt was revived in 1323 by John XXII. with doubtful success. The persecutions undertaken in the 14th and 15th centuries merely resulted in binding the Cathari to the invading Turks, with whom they found more tolerance than with the Slav princes converted to Roman orthodoxy.

Spain.

In Spain the papal Inquisition could gain no solid footing in the middle ages. Spain had been, in turn or simultaneously, Arian under the Visigoths, Catholic under the Hispano-Romans, Mussulman by conquest, and under a régime of religious peace Judaism had developed there. After the reconquest, and even at the height of the influence of the Cathari its heresies had been of quite minor importance. At the end of the 12th century Alphonso II. and Peter II. had on principle promulgated cruel edicts against heresy, but the persecution seemed to be dormant. By the bull *Declinante* of the 26th of May 1232 inquisitors were sent to Aragon by Gregory IX. on the request of Raymond of Penaforte, and by 1237–1238 the Inquisition was practically founded. But as early as 1233 King James I. had promulgated an edict against the heretics which quite openly put the Inquisition in a subaltern position, and secularized a great part of its activities. The people, moreover, showed great hostility towards it. The inquisitor Fray Pedro de Cadrayta was murdered by the mob, and in 1235 the Cortes, with the consent of King James, prohibited the use of inquisitorial procedure and of the torture, as constituting a violation of the Fueros, though they made no attempt to give effect to their prohibition. In Castile Alphonso the Wise had, by establishing in his *Fuero Real* and his *Siete Partidas* an entirely independent secular legislation with regard to heretics (1255), removed his kingdom from all papal interference. At the opening of the 14th century Castile and Portugal had still no Inquisition. But at that time in Spain orthodoxy was generally threatened only by a few Fraticelli and Waldenses, who were not numerous enough to call for active repression. The Spanish inquisitor Nicholas Eymerich, the author of the famous *Directorium Inquisitorum*, had rarely to exercise his functions during the whole of his long career (end of 14th century). It was not against heresy that the church had to direct its vigilance. A mutual tolerance between the different religions had in fact sprung up, even after the conquest; the Christians in the north recognized the Mahommedan and Jewish religions, and Alphonso VI. of Castile took the title of *imperador de los dos cultos*. But for a long time past both the decisions of councils and papal briefs had proclaimed their surprise and indignation at this ominous indifference. As early as 1077 the third council of Rome, and in 1081 Gregory VII., protested against the admission of Jews to public offices in Spain. Clement IV., in a brief of 1266, exhorted James I. of Aragon to expel the Moors from his dominions. In 1278 Nicholas III. blamed Peter III. for having made a truce with them. One of the canons of the council of Vienne (1311–1312) denounces as intolerable the fact that Mahommedan prayers were still proclaimed from the top of the mosques, and under the influence of this council the Spanish councils of Zamora (1313) and Valladolid (1322) came to decisions which soon led to violent measures against the Mudegares (Mussulmans of the old Christian provinces). Already in 1210 massacres of Jews had taken place under the inspiration of Arnold of Narbonne, the papal legate; in 1276 fresh disturbances took place as a result of James I.'s refusal to obey the order of Clement IV., who had called upon him to expel the Jews from his dominions. In 1278 Nicholas IV. commanded the general of the Dominicans to send friars into all parts of the kingdom to work for the conversion of the Jews, and draw up lists of those who should refuse to be baptized. It was in vain that a few princes such as Peter III. or Ferdinand of Castile interfered; the Spanish clergy directed the persecution with ever increasing zeal. In the 14th century the massacres increased, and during the year 1391 whole towns were destroyed by fire and sword, while at Valencia eleven thousand forced baptisms took place. In the 15th century the persecution continued in the same way; it can only be said that the years 1449, 1462, 1470, 1473 were marked by the greatest bloodshed. Moreover, the Mudegares were also subjected to these baptisms and massacres *en masse*. From those, or the children of those who had escaped death by baptism, was formed the class of *Conversos* or *Marranos*, the latter name being confined to the converted Jews. This class was still further increased after the conquest of the kingdom of Granada and the completion of the conquest by Ferdinand and Isabella, and after the pacification of the kingdoms of Aragon and Valencia by Charles V. The Mahommedans and Jews in these parts were given the choice between conversion and exile. Being of an active nature, and desiring some immediate powers as a recompense for their moral sufferings, the Jewish or Mussulman *Conversos* soon became rich and powerful. In addition to the hatred of the church, which feared that it might quickly become Islamized or Judaized in this country which had so little love for theology, hatred and jealousy arose also among laymen and especially in the rich and noble classes. *Limpieza*, *i.e.* purity of blood, and the fact of being an "old Christian" were made the conditions of holding offices. It is true, this mistrust had assumed a theological form even before the Mahommedan conquest. As early as 633 the council of Toledo had declared heretics such converts, forced or voluntary, as returned to their old religion. When this principle was revived and, whether through secular jealousy, religious dislike or national pride, was applied to the *Conversos*, an essentially national Inquisition, directed against local heretics, was founded in Spain, and founded without the help of the papacy. It was created in 1480 by Ferdinand and Isabella. Sixtus IV. had wished the papal Inquisition to be established after the form and spirit of the middle ages; but Ferdinand, in his desire for centralization (his efforts in this direction had already led to the creation of the Holy Hermandad and the extension of the royal jurisdiction) wished to establish an inquisition which should be entirely Spanish, and entirely royal. Rome resisted, but at last gave way. Sixtus IV., Alexander VI., Innocent VIII., Julius II. and after them all the popes of the 16th century, saw in this secular attempt a great power in favour of orthodoxy, and approved it when established, and on seeing its constant activity. The Inquisition took advantage of this to claim an almost complete autonomy. The decisions of the Roman Congregation of the Index were only valid for Spain if the Holy Office of Madrid thought good to countersign them; consequently there were some books approved at Rome and proscribed in the peninsula, such as the *Historia pelagiana* of Cardinal Nores, and some which were forbidden at Rome and approved in the peninsula, such as the writings of Fathers Mateo Moya and Juan Bautista Poza. The Spanish Holy Office perceived long before Rome the dangers of mysticism, and already persecuted the mystics, the *Alumbrados* while Rome (impervious to Molinism) still favoured them. "During the last few centuries the church of Spain was at once the most orthodox and the most independent of the national churches" (Ch. V. Langlois). There was even a financial dispute between the Inquisition and the papacy, in which the Inquisition had the better of the argument; the Roman Penitentiary sold exemptions from penalties (involving loss of civil rights), such as prison, the galleys and wearing the *sanbenito*, and dispensations from the crime of *Marrania* (secret Judaism). The inquisitors tried to gain control of this sale, and at a much higher price, and were seconded in this by the kings of Spain, who saw that it was to their own interest. At first they tried a compromise; the unfortunate victims had to pay twice, to the pope and to the Inquisition. But the payment to the pope was held by the Inquisition to reduce too much its own share of the confiscated property, and the struggle continued throughout the first half of the 16th century, the Curia finally triumphing, thanks to the energy of Paul III. Since, however, the Inquisition continued to threaten the holders of papal dispensations, most of them found it prudent to demand a definite rehabilitation, in return for payments both to the king and the Inquisition. As a national institution the Inquisition had first of all the advantage of a very strong centralization and very rapid procedure, consisting as it did of an organization of local tribunals with a supreme council at Madrid, the *Suprema*. The grand inquisitor was *ex officio* president for life of the royal council of the Inquisition. It was the grand inquisitor, General Jimenez de Cisneros, who set in motion the inquisitorial tribunals of Seville, Cordova, Jaen, Toledo, Murcia, Valladolid and Calahorra. There was no such tribunal at Madrid till the time of Philip IV. The inquisitor-general of Aragon established inquisitors at Saragossa, Barcelona, Valencia, Majorca, Sardinia, Sicily and Pampeluna (moved later to Calahorra). From the very beginning the papacy strengthened this organization by depriving the Spanish metropolitans, by the bull of the 25th of September 1487, of the right of receiving appeals from the decisions given jointly by the bishops of the various dioceses, their suffragans and the apostolic inquisitors, and by investing the inquisitor-general with this right. And, more than this, Torquemada actually took proceedings against bishops, for example, the accusation of heresy against Don Pedro Aranda, bishop of Calahorra (1498); while the inquisitor Lucero prosecuted the first archbishop of Granada, Don Ferdinando de Talavera. Further, when once the Inquisition was closely allied to the crown, no Spaniard, whether clerk or layman, could escape its power. Even the Jesuits, though not till after 1660, were put under the authority of the Suprema. The highest nobles were kept constantly under observation; during the reigns of Charles III. and Charles IV. the duke of Almodovar, the count of Aranda, the great writer Campomanes, and the two ministers Melchior de Jovellanos and the count of Florida-Alanca, were attacked by the Suprema. But the descendants of Moors and Jews, though they were good Christians, or even nobles, were most held in suspicion. Even during the middle ages the descendants of the Paterenes were known, observed and denounced. In the eyes of the Inquisition the taint of heresy was even more indelible. A family into which a forced conversion or a mixed marriage had introduced Moorish or Jewish blood was almost entirely deprived of any chance of public office, and was bound, in order to disarm suspicion, to furnish agents or spies to the Holy Office. The Spaniards were very quick to accept the idea of the Inquisition to such an extent as to look upon heresy as a national scourge to be destroyed at all costs, and they consequently considered the Inquisition as a powerful and indispensable agent of public protection; it would be going too far to state that this conception is unknown to orthodox present-day historians of the Inquisition, and especially certain Spanish historians (cf. the preface to Menendez y Pelayo's *Heterodoxos españoles*). As had happened among the Albigenses, commerce and industry were rapidly paralysed in Spain by this odious régime of suspicion, especially as the *Conversos*, who inherited the industrial and commercial capacity of the Moors and Jews, represented one of the most active elements of the population. Besides, this system of wholesale confiscations might reduce a family to beggary in a single day, so that all transactions were liable to extraordinary risks. It was in vain that the counsellors of Charles V., and on several occasions the Cortes, demanded that the inquisitors and their countless agents should be appointed on a fixed system by the state; the state, and above all the Inquisition, refused to make any such change. The Inquisition preferred to draw its revenues from heresy, and this is not surprising if we think of the economic aspect of the Albigensian Inquisition; the system of *encours* was simply made general in Spain, and managed to exist there for three centuries. In the case of the Inquisition in Languedoc, there still remained the possibility of an appeal to the king, the inquisitors, or more rarely the pope, against these extortions; but there was nothing of the kind in Spain. The Inquisition and the Crown could refuse each other nothing, and appeals to the pope met with their united resistance. As early as the reign of Ferdinand certain rich *Conversos* who had bought letters of indulgence from the Holy See were nevertheless prosecuted by Ferdinand and Torquemada, in spite of the protests of Sixtus IV. The papacy met with the most serious checks under the Bourbons. Philip V. forbade all his subjects to carry appeals to Rome, or to make public any papal briefs without the royal *exequatur*.

The political aspect of the work and character of the Inquisition has been very diversely estimated; it is a serious error to attribute to it, as has too often been done, extreme ideas of equality, or even to represent it as having favoured centralization and a royal absolutism to the same extent as the Inquisition of the 13th and 14th centuries in Languedoc. "It was a mere coincidence," says H. C. Lea, "that the Inquisition and absolutism developed side by side in Spain." The Suprema did not attack all nobles as nobles; it attacked certain of them as *Conversos*, and the Spanish feudal nobles were sure enough of their *limpieza* to have nothing to fear from it. But it is undeniable that it frequently tended to constitute a state within the state. At the time of their greatest power, the inquisitors paid no taxes, and gave no account of the confiscations which they effected; they claimed for themselves and their agents the right of bearing arms, and it is well known that their declared adversaries, or even those who blamed them in some respects, were without fail prosecuted for heresy. But that was not the limit to their pretensions. In 1574, under Philip II., there was an idea of instituting a military order, that of Santa Maria de la Espada Blanca, having as its head the grand inquisitor, and to him all the members of the order, *i.e.* all Spaniards distinguished by *limpieza* of blood, were to swear obedience in peace and in war. Moreover, they were to recognize his jurisdiction and give up to him the reversion of their property. Nine provinces had already consented, when Philip II. put a stop to this theocratic movement, which threatened his authority. It was, however, only the Bourbons, who had imbibed Gallican ideas, who by dint of perseverance managed to make the Inquisition subservient to the Crown, and Charles III., "the philosopher king," openly set limits to the privileges of the inquisitors. Napoleon, on his entry into Madrid (December 1808), at once suppressed the Inquisition, and the extraordinary general Cortes on the 12th of February 1813 declared it to be incompatible with the constitution, in spite of the protests of Rome. Ferdinand VII. restored it (July 21, 1814) on his return from exile, but it was impoverished and almost powerless. It was again abolished as a result of the Liberal revolution of 1820, was restored temporarily in 1823 after the French military intervention under the duc d'Angoulême, and finally disappeared on the 15th of July 1834, when Queen Christina allied herself with the Liberals. "It was not, however, till the 8th of May 1869 that the principle of religious liberty was proclaimed in the peninsula; and even since then it has been limited by the constitution of 1876, which forbids the public celebration of dissident religions" (S. Reinach). In 1816 the pope abolished torture in all the tribunals of the Inquisition. It is a too frequent practice to represent as peculiar to the Spanish Inquisition modes of procedure in use for a long time in the inquisitorial tribunals of the rest of Europe. There are no special manuals, or *practica*, for the inquisitorial procedure in Spain; but the few distinctive characteristics of this procedure may be mentioned. The Suprema allowed the accused an advocate chosen from among the members or familiars of the Holy Office; this privilege was obviously illusory, for the advocate was chosen and paid by the tribunal, and could only interview the accused in presence of an inquisitor and a secretary. The theological examination was a delicate and minute proceeding; the "qualificators of the Holy Office," special functionaries, whose equivalent can, however, easily be found in the medieval Inquisition, charged those books or speeches which had incurred "theological censures," with "slight, severe or violent" suspicion. There was no challenging of witnesses; on the contrary, witnesses who were objected to were allowed to give evidence on the most important points of the case. The torture, to the practice of which the Spanish Inquisition certainly added new refinements, was originally very much objected to by the Spaniards, and Alphonso X. prohibited it in Aragon; later, especially in the 15th, 16th and 17th centuries it was applied quite shamelessly on the least suspicion. But by the end of the 18th century, according to Llorente, it had not been employed for a long time; the *fiscal*, however, habitually demanded it, and the accused always went in dread of it. The punishment of death by burning was much more often employed by the Spanish than by the medieval Inquisition; about 2000 persons were burnt in Torquemada's day. Penitents were not always reconciled, as they were in the middle ages, but those condemned to be burnt were as a rule strangled previously.

With the extension of the Spanish colonial empire the

Inquisition spread throughout it almost contemporaneously with the Catholic faith. Ferdinand IV. decreed the establishment of the Inquisition in America, and Jimenes in 1516 appointed Juan Quevedo, bishop of Cuba, inquisitor-general delegate with discretionary powers. Excesses having been committed by the agents of the Holy Office, Charles V. decreed (October 15, 1538) that only the European colonists should be subject to the jurisdiction of the Inquisition; but Philip II. increased the powers of the inquisitors' delegate and, in 1541, established on a permanent basis three new provinces of the Inquisition at Lima, Mexico and Cartagena. The first *auto-da-fé* took place at Mexico in 1574, the year in which Hernando Cortez died. The Inquisition of Portugal was no less careful to ensure the orthodoxy of the Portuguese colonies. An Inquisition of the East Indies was established at Goa, with jurisdiction over all the dominions of the king of Portugal beyond the Cape of Good Hope. Finally Philip II. even wished to establish an itinerant Inquisition, and at his request the pope created, by a brief of the 21st of July 1571, the "Inquisition of the galleys," or "of fleets and armies."

Spanish and Portuguese Colonies.

After the expulsion of the Jews under Isabella the Catholic (1492), followed under Philip III. by that of the Moriscoes (1609), the Inquisition attacked especially Catholics descended from infidels, the *Marranes* and *Conversos*, who were, not without reason, suspected of often practising in secret the rites of their ancestral religions. As late as 1715 a secret association was discovered at Madrid, consisting of twenty families, having a rabbi and a synagogue. In 1727 a whole community of Moriscoes was denounced at Granada, and prosecuted with the utmost rigour. Again, a great number of people were denounced, sent to the galleys, or burnt, for having returned to their ancestral religion, on the flimsiest of evidence, such as making ablutions during the day time, abstaining from swine's flesh or wine, using henna, singing Moorish songs, or possessing Arabic manuscripts. During the 16th and 17th centuries the Inquisition in Spain was directed against Protestantism. The inquisitor-general, Fernando de Valdés, archbishop of Seville, asked the pope to condemn the Lutherans to be burnt even if they were not backsliders, or wished to be reconciled, while in 1560 three foreign Protestants, two Englishmen and a Frenchman were burnt in defiance of all international law. But the Reformation never had enough supporters in Spain to occupy the attention of the Inquisition for long. After the *Marranes* the mystics of all kinds furnished the greatest number of victims to the terrible tribunal. Here again we should not lose sight of the tradition of the medieval Inquisition; the mysticism of the Beghards, the Brethren of the Free Spirit and the innumerable pantheist sects had been pitilessly persecuted by the inquisitors of Germany and France during the 14th and 15th centuries. The Illuminati (*alumbrados*), who were very much akin to the medieval sectaries, and the mystics of Castile and Aragon were ruthlessly examined, judged and executed. Not even the most famous persons could escape the suspicious zeal of the inquisitors Valdés and Melchior Cano. The writings of Luis de Granada were censured as containing *cosas de alumbrados.* St Ignatius de Loyola was twice imprisoned at the beginning of his career; St Theresa was accused of misconduct, and several times denounced; one of her works, *Conceptos del amor divino*, was prohibited by the Inquisition, and she was only saved by the personal influence of Philip II. Countless numbers of obscure visionaries, devotees both men and women, clerks and laymen, were accused of Illuminism and perished in the fires or the dungeons of the Inquisition. From its earliest appearance Molinosism was persecuted with almost equal rigour. Molinos himself was arrested and condemned to perpetual imprisonment (1685–1687), and during the 18th century, till 1781, several Molinosists were burnt. The Inquisition also attacked Jansenism, freemasonry (from 1738 onwards; cf. the bull *In eminenti*) and "philosophism," the learned naturalist José Clavigo y Faxarcho (1730–1806), the mathematician Benito Bails (1730–1797), the poet Tomas de Iriarte, the ministers Clavigo Ricla, Aranda and others being prosecuted as "philosophers." Subject also to the tribunal of the Holy Office were bigamists, blasphemers, usurers, sodomites, priests who had married or broken the secrecy of the confessional, laymen who assumed ecclesiastical costume, &c. "In all these matters, though the Inquisition may have been indiscreet in meddling with affairs which did not concern it, it must be confessed that it was not cruel, and that it was always preferable to fall into the hands of the Inquisition rather than those of the secular judges, or even the Roman inquisitors" (S. Reinach). Apart from certain exceptional cruelties such as those of the Inquisition of Calahorra, perhaps the greatest number of executions of sorcerers took place in the colonies, in the Philippines and Mexico. In Spain the persecution was only moderate; at certain times it disappeared almost completely, especially in the time of the clear-sighted inquisitor Salazar.

Other activities of the Spanish Inquisition.

Two features of the Spanish Inquisition are especially noteworthy: the prosecutions for "speeches suspected of heresy" and the censure of books. The great scholar Pedro de Lerma, who after fifty years at Paris (where he was dean of the faculty of theology) had returned to Spain as abbot of Compluto, was called upon in 1537 to abjure eleven "Erasmian" propositions, and was forced to return to Paris to die. Juan de Vergara and his brother were summoned before the Inquisition for favouring Erasmus and his writings, and detained several years before they were acquitted. Fray Alonso de Virues, chaplain to Charles V., was imprisoned on an absurd charge of depreciating the monastic state, and was only released by the pope at the instance of the emperor. Mateo Pascual, professor of theology at Alcala, who had in a public lecture expressed a doubt as to purgatory, suffered imprisonment and the confiscation of his goods. A similar fate befell Montemayor, Las Brozas and Luis de la Cadena.

The censure of books was established in 1502 by Ferdinand and Isabella as a state institution. All books had to pass through the hands of the bishops; in 1521 the Inquisition took upon itself the examination of books suspected of Lutheran heresy. In 1554 Charles V. divided the responsibility for the censorship between the Royal Council, whose duty it was to grant or refuse the *imprimatur* to manuscripts and the Inquisition, which retained the right of prohibiting books which it judged to be pernicious; but after 1527 it also gave the licence to print. In 1547 the Suprema produced an Index of prohibited books, drawn up in 1546 by the university of Louvain; it was completed especially as regards Spanish books, in 1551, and several later editions were published. Moreover, the *revisores de libros* might present themselves in the name of the Holy Office in any private library or bookshop and confiscate prohibited books. In 1558 the penalty of death and confiscation of property was decreed against any bookseller or individual who should keep in his possession condemned books. The censure of books was eventually abolished in 1812.

Bibliography.—A critical bibliography was drawn up by P. Fredericq in the preface to the French translation (1900) of H. C. Lea's important standard work: *History of the Inquisition in the Middle Ages* (3 vols., London, 1888). See also J. Havet, *L'Hérésie et le bras séculier au moyen âge jusqu'au XIII^e siècle* in the *Œuvres complètes*, vol. ii. (Paris, 1896); Ch. V. Langlois, *L'Inquisition d'après des travaux récents* (Paris, 1901); Douais, *L'Inquisition* (Paris, 1907); E. Vacandard, *L'Inquisition* (Paris, 1907); Douais, *Documents pour servir à l'histoire de l'inquisition dans le Languedoc* (2 vols., Paris, 1900); Döllinger, *Beiträge zur Sektengeschichte des Mittelalters* (2 vols., Munich, 1890. The second volume is composed of documents); Molinier, *L'Inquisition dans le midi de la France au XIII^e et au XIV^e siècle. Etude sur les sources de son histoire* (Paris, 1880); P. C. Lea, *History of the Inquisition of Spain* (5 vols., London, 1905–1908); S. Reinach, articles on Lea's *History of the Inquisition of Spain* in the *Revue critique* (1906, 1907, 1908) and *Cultes, mythes et religions* (Paris, 1908), tome iii. (P. A.)

INSANITY (from Lat. *in*, not, and *sanus*, sound), a generic term applied to certain morbid mental conditions produced by defect or disease of the brain. The synonyms in more or less frequent use are *lunacy* (from a supposed influence of the moon), *mental disease, alienation, derangement, aberration, madness, unsoundness of mind*. The term *Psychiatry* (ψυχή, mind, and ἰατρεία, treatment) is applied to the study and treatment of the condition.

I. Medical and General

Definition. There are many diseases of the general system productive of disturbance of the mental faculties, which, either on account of their transient nature, from their being associated with the course of a particular disease, or from their slight intensity, are not included under the head of insanity proper. From a strictly scientific point of view it cannot be doubted that the fever patient in his delirium, or the drunkard in his excitement or stupor, is insane; the brain of either being under the influence of a morbific agent or of a poison, the mental faculties are deranged; yet such derangements are regarded as functional disturbances, *i.e.* disturbances produced by agencies which experience tells will, in the majority of cases, pass off within a given period without permanent results on the tissues of the organ. The comprehensive scientific view of the position is that all diseases of the nervous system, whether primary or secondary, congenital or acquired, should, in the words of Griesinger, be regarded as one inseparable whole, of which the so-called mental diseases comprise only a moderate proportion. However important it may be for the physician to keep this principle before him, it may be freely admitted that it cannot be carried out fully in practice, and that social considerations compel the medical profession and the public at large to draw an arbitrary line between such functional diseases of the nervous system as *hysteria, hypochondriasis* and *delirium* on the one hand, and such conditions as *mania, melancholia, stupor* and *dementia* on the other.

All attempts at a short definition of the term "insanity" have proved unsatisfactory; perhaps the nearest approach to accuracy is attained by the rough statement that it is *a symptom of disease of the brain inducing disordered mental symptoms*—the term disease being used in its widest acceptance. But even this definition is at once too comprehensive, as under it might be included certain of the functional disturbances alluded to, and too exclusive, as it does not comprehend certain rare transitory forms. Still, taken over all, this may be accepted as the least defective short definition; and moreover it possesses the great practical advantage of keeping before the student the primary fact that insanity is the result of disease of the brain (see Brain, and Neuropathology), and that it is not a mere immaterial disorder of the intellect. In the earliest epochs of medicine the corporeal character of insanity was generally admitted, and it was not until the superstitious ignorance of the middle ages had obliterated the scientific, though by no means always accurate, deductions of the early writers, that any theory of its purely psychical character arose. At the present day it is unnecessary to combat such a theory, as it is universally accepted that the brain is the organ through which mental phenomena are manifested, and therefore that it is impossible to conceive of the existence of an insane mind in a healthy brain. On this basis insanity may be defined as consisting in *morbid conditions of the brain, the results of defective formation or altered nutrition of its substance induced by local or general morbid processes, and characterized especially by non-development, obliteration, impairment or perversion of one or more of its psychical functions.* Thus insanity is not a simple condition; it comprises a large number of diseased states of the brain, gathered under one popular term, on account of mental defect or aberration being the predominant symptom.

Classification. The insanities are sharply divided into two great classes—the *Congenital* and the *Acquired*. Under the head of Congenital Insanity must be considered all cases in which, from whatever cause, brain development has been arrested, with consequent impotentiality of development of the mental faculties; under that of Acquired Insanity all those in which the brain has been born healthy but has suffered from morbid processes affecting it primarily, or from diseased states of the general system implicating it secondarily. In studying the causation of these two great classes, it will be found that certain remote influences exist which are believed to be commonly predisposing; these will be considered as such, leaving the proximate or exciting causes until each class with its subdivisions comes under review.

Causation. In most treatises on the subject will be found discussed the bearing which civilization, nationality, occupation, education, &c., have, or are supposed to have, on the production of insanity. Such discussions are as a rule eminently unsatisfactory, founded as they are on common observation, broad generalizations, and very imperfect statistics. As they are for the most part negative in result, at the best almost entirely irrelevant to the present purpose, it is proposed merely to summarize shortly the general outcome of what has been arrived at by those authorities who have sought to assess the value to be attached to the influence exercised by such factors, without entering in any detail on the theories involved. The causes of insanity may be divided into (*a*) general, and (*b*) proximate.

(*a*) General Causes.—1. *Civilization.*—Although insanity is by no means unknown amongst savage races, there can be no reasonable doubt that it is much more frequently developed in civilized communities; also that, as the former come under the influence of civilization, the percentage of lunacy is increased. This is in consonance with the observation of disease of whatever nature, and is dependent in the case of insanity on the wear and tear of nerve tissue involved in the struggle for existence, the physically depressing effects of pauperism, and on the abuse of alcoholic stimulants; each of which morbid factors falls to be considered separately as a proximate cause. In considering the influence of civilization upon the production of insanity, regard must be had to the more evolved ethical attitude towards disease in general which exists in civilized communities as well as to the more perfect recognition and registration of insanity.

2. *Nationality.*—In the face of the imperfect social statistics afforded by most European and American nations, and in their total absence or inaccessibility amongst the rest of mankind, it is impossible to adduce any trustworthy statement under this head.

3. *Occupation.*—There is nothing to prove that insanity is in any way connected with the prosecution of any trade or profession *per se*. Even if statistics existed (which they do not) showing the proportion of lunatics belonging to different occupations to the 1000 of the population, it is obvious that no accurate deduction *quoad* the influence of occupation could be drawn.

4. *Education.*—There is no evidence to show that education has any influence over either the production or the prevention of insanity. The general result of discussions on the above subjects has been the production of a series of arithmetical statements, which have either a misleading bearing or no bearing at all on the question. In the study of insanity statistics are of slight value from the scientific point of view, and are only valuable in its financial aspects.

5. *Inheritance.*—The hereditary transmission of a liability to mental disease must be reckoned as the most important among all predisposing causes of insanity. It is probably well within the mark to say that at least 50% of the insane have a direct or collateral hereditary tendency towards insanity. The true significance of this factor cannot as yet be explained or described shortly and clearly, but it cannot be too definitely stated that it is not the insanity which is inherited, but only the predisposition to the manifestation of mental symptoms in the presence of a sufficient exciting cause. The most widely and generally accepted view of the exciting cause of insanity is that the predisposed brain readily breaks down under mental stress or bodily privations. There is, however, another view which has been recently advanced to the effect that the majority of mental diseases are secondary to bodily disorders, hereditary predisposition being the equally predisposing causal factor. There is probably truth in both these views, and such an admission accentuates the complexity of the factorship of heredity. If insanity can be induced by physical disorders, which must essentially be of the nature of toxic action or of mechanical agency which can alter or influence the functional powers of the brain, then it is probable that hereditary predisposition to insanity means, not only the transmission of an unstable nervous system, but also a constitution which is either peculiarly liable to the production of such toxic or poisonous substances, or incapable of effectively dealing with the toxins or poisonous substances normally formed during metabolic processes. Such a view broadens our conception of the factorship of hereditary transmission and offers

explanation as to the manner in which insanity may appear in families previously free from the taint. Very frequently we find in the history of insane patients that although there may be no insanity in the family there are undoubted indications of nervous alongside of physical instability, the parental nervous defects taking the form of extreme nervousness, vagabondage, epilepsy, want of mental balance, inequality in mental development or endowment, extreme mental brilliancy in one direction associated with marked deficiency in others, the physical defects showing themselves in the form of insanity; liability to tubercular and rheumatic infections. The failure of constitutional power which allows of the invasion of the tubercle bacillus and the micrococcus rheumaticus in certain members of a family is apparently closely allied to that which favours the development of mental symptoms in others.

6. *Consanguinity.*—It has been strongly asserted that consanguineous marriage is a prolific source of nervous instability. There is considerable diversity of opinion on this subject; the general outcome of the investigations of many careful inquirers appears to be that the offspring of healthy cousins of a healthy stock is not more liable to nervous disease than that of unrelated parents, but that evil consequences follow where there is a strong tendency in the family to degeneration, not only in the direction of the original diathesis, but also towards instability of the nervous system. The objection to the marriage of blood relations does not arise from the bare fact of their relationship, but has its ground in the fear of their having a vicious variation of constitution, which, in their children, is prone to become intensified. There is sufficient evidence adducible to prove that close breeding is productive of degeneration; and when the multiform functions of the nervous system are taken into account, it may almost be assumed, not only that it suffers concomitantly with other organs, but that it may also be the first to suffer independently.

7. *Parental Weakness.*—Of the other causes affecting the parents which appear to have an influence in engendering a predisposition to insanity in the offspring, the abuse of alcoholic stimulants and opiates, over-exertion of the mental faculties, advanced age and weak health may be cited. Great stress has been laid on the influence exercised by the first of these conditions, and many extreme statements have been made regarding it. Such statements must be accepted with reserve, for, although there is reason for attaching considerable weight to the history of ancestral intemperance as a probable causating influence, it has been generally assumed as the proved cause by those who have treated of the subject, without reference to other agencies which may have acted in common with it, or quite independently of it. However unsatisfactory from a scientific point of view it may appear, the general statement must stand that whatever tends to lower the nervous energy of a parent may modify the development of the progeny. Constitutional tendency to nervous instability once established in a family may make itself felt in various directions—epilepsy, hysteria, hypochondriasis, neuralgia, certain forms of paralysis, insanity, eccentricity. It is asserted that exceptional genius in an individual member is a phenomenal indication. Confined to the question of insanity, the morbid inheritance may manifest itself in two directions—in defective brain organization manifest from birth, or from the age at which its faculties are potential, *i.e.* congenital insanity; or in the neurotic diathesis, which may be present in a brain to all appearance congenitally perfect, and may present itself merely by a tendency to break down under circumstances which would not affect a person of originally healthy constitution.

8. *Periodic Influence.*—The evolutional periods of puberty, adolescence, utero-gestation, the climacteric period and old age exercise an effect upon the nervous system. It may be freely admitted that the nexus between physiological processes and mental disturbances is, as regards certain of the periods, obscure, and that the causal relation is dependent more on induction than on demonstration; but it may be pleaded that it is not more obscure in respect of insanity than of many other diseases. The pathological difficulty obtains mostly in the relation of the earlier evolutional periods, puberty and adolescence, to insanity; in the others a physiologico-pathological nexus may be traced; but in regard to the former there is nothing to take hold of except the purely physiological process of development of the sexual function, the expansion of the intellectual powers, and rapid increase of the bulk of the body. Although in thoroughly stable subjects due provision is made for these evolutional processes, it is not difficult to conceive that in the nervously unstable a considerable risk is run by the brain in consequence of the strain laid on it. Between the adolescent and climacteric periods the constitution of the nervous, as of the other systems, becomes established, and disturbance is not likely to occur, except from some accidental circumstances apart from evolution. In the most healthily constituted individuals the "change of life" expresses itself by some loss of vigour. The nourishing (trophesial) function becomes less active, and either various degrees of wasting occur or there is a tendency towards restitution in bulk of tissues by a less highly organized material. The most important instance of the latter tendency is fatty degeneration of muscle, to which the arterial system is very liable. In the mass of mankind those changes assume no pathological importance: the man or woman of middle life passes into advanced age without serious constitutional disturbance; on the other hand, there may be a break down of the system due to involutional changes in special organs, as, for instance, fatty degeneration of the heart. In all probability the insanity of the climacteric period may be referred to two pathological conditions: it may depend on structural changes in the brain due to fatty degeneration of its arteries and cells, or it may be a secondary result of general systemic disturbance, as indicated by cessation of menstruation in the female and possibly by some analogous modification of the sexual function in men. The senile period brings with it further reduction of formative activity; all the tissues waste, and are liable to fatty and calcareous degeneration. Here again, the arteries of the brain are very generally implicated; atheroma in some degree is almost always present, but is by no means necessarily followed by insanity.

The various and profound modifications of the system which attend the periods of utero-gestation, pregnancy and child-bearing do not leave the nervous centres unaffected. Most women are liable to slight changes of disposition and temper, morbid longings, strange likes and dislikes during pregnancy, more especially during the earlier months; but these are universally accepted as accompaniments of the condition not involving any doubts as to sanity. But there are various factors at work in the system during pregnancy which have grave influence on the nervous system, more especially in those hereditarily predisposed, and in those gravid for the first time. There is modification of direction of the blood towards a new focus, and its quality is changed, as is shown by an increase of fibrin and water and a decrease of albumen. To such physical influences are superadded the discomfort and uneasiness of the situation, mental anxiety and anticipation of danger, and in the unmarried the horror of disgrace. In the puerperal (recently delivered) woman there are to be taken into pathological account, in addition to the dangers of sepsis, the various depressing influences of child-bed, its various accidents reducing vitality, the sudden return to ordinary physiological conditions, the rapid call for a new focus of nutrition, the translation as it were of the blood supply from the uterus to the mammae—all physical influences liable to affect the brain. These influences may act independently of moral shock; but, where this is coincident, there is a condition of the nervous system unprepared to resist its action.

(*b*) Proximate Causes.—The proximate causes of insanity may be divided into (1) toxic agents, (2) mechanical injury to the brain, including apoplexies and tumours, and (3) arterial degeneration.

1. *Toxic Agents.*—The definite nature of the symptoms in the majority of the forms of acute insanity leave little reason to doubt that they result from an invasion of the system by toxins of various kinds. The symptoms referred to may be briefly indicated as follows: (i.) Pyrexia, or fever generally of an irregular type; (ii.) Hyperleucocytosis, or an increase of the white blood corpuscles, which is the chief method by which the animal organism protects itself against the noxious influence of micro-organisms and their toxins. In such cases as typhoid fever, which is caused by a bacillus, or Malta fever which is caused by a coccus, it is found that if the blood serum of the patient is mixed *in vitro* with a broth culture of the infecting organism in a dilution of 1 in 50, that the bacilli or the cocci, as the case may be, when examined microscopically, are seen to run into groups or clusters. The organisms are said to be agglutinated, and the substance in the serum which produces this reaction is termed an agglutinine. In many of the forms of insanity which present the symptom of hyperleucocytosis there can also be demonstrated the fact that the blood serum of the patients contains agglutinines to certain members of a group of streptococci (so called on account of their tendency to grow in the form of a chain, στρεπτός; (iii.) the rapid organic affection of the special nerve elements depending upon the virulence of the toxin, and the resistance of the individual to its influence; (iv.) the marked physical deterioration as indicated by emaciation and other changes in nutrition; (v.) the close analogy between the character of many of the mental symptoms, *e.g.* delirium, hallucinations or depression, and the symptoms produced artificially by the administration of certain poisonous drugs.

The toxic substances which are generally believed to be associated with the causation of mental disorders may be divided into three great classes: (*a*) those which arise from the morbific products of metabolism within the body itself "auto-intoxicants"; (*b*) those due to the invasion of the blood or tissues by micro-organisms; (*c*) organic or inorganic poisons introduced into the system voluntarily or accidentally.

(*a*) Auto-intoxication may be due to defective metabolism or to physiological instability, or to both combined. The results of defective metabolism are most clearly manifested in the mental symptoms which not infrequently accompany such diseases as gout, diabetes or obesity, all of which depend primarily upon a deficient chemical elaboration of the products of metabolism. The association of gout and rheumatism with nervous and mental diseases is historical, and the gravest forms of spinal and cerebral degeneration have been found in association with diabetes. Until the pathology of these affections is better understood we are not in a position to determine the nature of the toxins which appear to be the cause of these diseases and of their accompanying nervous symptoms. Physiological instability is usually manifested by neurotic persons under the strain of any unusual change in their environment. If, for instance, any material change in the food supply consisting either in a decrease of its quality or quantity, or in a failure to assimilate it properly, the nerve-cells become exhausted and irritable, sleep is diminished and a condition known as the delirium of collapse or exhaustion may supervene. An extreme instance of this condition is presented by the delirium occurring in shipwrecked persons, who having to take to the boats are suddenly deprived of food, water or both. Poisoning of the nervous system may also result from the defective action of special glands such as the thyroid, the liver or the kidneys. These conditions are specially exemplified in the mental disturbances which accompany exophthalmic goitre, uraemic poisoning, and the conditions of depression which are observed in jaundice and other forms of hepatic insufficiency.

The results of modern research point to a growing belief in the frequency of infection of the nervous system from the hosts of micro-organisms which infest the alimentary tract. No definite or substantiated discoveries have as yet been formulated which would justify us in treating this source of infection as more than a highly probable causative influence.

(*b*) When we turn, however, to the potentiality of infection by micro-organisms introduced from without into the system we are upon surer if not upon entirely definite ground. A special form of insanity called by Weber, who first described it, the delirium of collapse, was observed by him to follow certain infectious diseases such as typhus fever and pneumonia. In later years it has been frequently observed to follow attacks of influenza. Recently our views have broadened and we find that the delirium of collapse is an acute, confusional insanity which may arise without any previous febrile symptoms, and is in fact one of the common forms of acute insanity. The nature of the physical symptoms, the mental confusion and hallucinations which accompany it, as well as the fact that it frequently follows some other infective disease, leave no doubt as to its toxic origin. A similar and analogous condition is presented by incidence of general paralysis after a previous syphilitic infection. The symptoms of general paralysis coupled with the extensive and rapid degeneration of not only the nervous but of the whole of the body tissues point to a microbic disease of intense virulence which, though probably not syphilitic, is yet induced, and enhanced in its action by the previous devitalizing action of the syphilitic toxin. There is abundant evidence to show that emotions which powerfully affect the mind, if long continued, conduce towards a condition of metabolic change, which in its turn deleteriously affects the nervous system, and which may terminate in inducing a true toxic insanity.

One of the best examples of insanity arising from micro-organisms is that form which occurs after childbirth, and which is known as puerperal mania. Other insanities may, it is true, arise at this period, but those which occur within the first fourteen days after parturition are generally of infective origin. The confusional nature of the mental symptoms, the delirium and the physical symptoms are sufficient indications of the analogy of this form of mental aberration with such other toxic forms of insanity as we find arising from septic wounds and which sometimes accompany the early toxic stages of virulent infectious diseases such as typhus, diphtheria or malignant scarlet fever.

The infective origin of puerperal mania is undoubted, though, as yet, no special pathogenic organism has been isolated. Dr Douglas (*Ed. Med. Journ.*, 1897, i. 413) found the staphylococcus pyogenes aureus present in the blood in one case; Jackman (quoted *loc. cit.*) found the micrococcus pneumonial crouposae in one case; while Haultain (*Ed. Med. Journ.*, 1897, ii. 131) found only the bacillus coli communis in the blood and secretions of several cases. From our experience of similar mental and physical symptoms produced as a result of septic wounds or which succeed surgical operations there seems to be no doubt that several forms of micrococci or streptococci of a virulent character are capable by means of the toxins they exude of causing acute delirium or mania of a confusional clinical type when introduced into the body.

(*c*) Accidental and voluntary poisonings of the system which result in insanity are illustrated by the forms of insanity which follow phosphorus or lead poisoning and by Pellagra. The voluntary intoxication of the system by such drugs as morphia and alcohol will be treated of below.

2 and 3. Mechanical injuries to the brain arise from direct violence to the skull, from apoplectic hemorrhage or embolism, or from rapidly growing tumours, or from arterial degeneration.

The forms of insanity may be divided into (I.) Congenital Mental Defect and (II.) Acquired Insanity.

Forms of Insanity.

I. *Congenital Mental Defect.*—The morbid mental conditions which fall to be considered under this head are *Idiocy* (with its modification, Imbecility) and *Cretinism* (*q.v.*).

Idiocy (from Gr. ἰδιώτης, in its secondary meaning of a deprived person). In treating of idiocy it must be carefully borne in mind that we are dealing with mental phenomena dissociated for the most part from active bodily disease, and that, in whatever degree it may exist, we have to deal with a brain condition fixed by the pathological circumstances under which its possessor came into the world or by such as had been present before full cerebral activity could be developed, and the symptoms of which are not dependent on the intervention of any subsequent morbid process. From the earliest ages the term *Amentia* has been applied to this condition, in contradistinction to *Dementia*, the mental weakness following on acquired insanity.

Idiocy.

The causes of congenital idiocy may be divided into four classes: (1) hereditary predisposition, (2) constitutional conditions of one or both parents affecting the constitution of the infant, (3) injuries of the infant prior to or at birth, and (4) injuries or diseases affecting the infant head during infancy. All these classes of causes may act in two directions: they may produce either non-development or abnormal development of the cranial bones as evidenced by microcephalism, or by deformity of the head; or they may induce a more subtle morbid condition of the constituent elements of the brain. As a rule, the pathological process is more easily traceable in the case of the last three classes than in the first. For instance, in the case of constitutional conditions of the parents we may have a history of syphilis, a disease which often leaves its traces on the bones of the skull; and in the third case congenital malformation of the brain may be produced by mechanical causes acting on the child in utero, such as an attempt to procure abortion, or deformities of the maternal pelvis rendering labour difficult and instrumental interference necessary. In such cases the bones of the skull may be injured; it is only fair, however, to say that more brains are saved than injured by instrumental interference. With regard to the fourth class, it is evident that the term congenital is not strictly applicable; but, as the period of life implicated is that prior to the potentiality of the manifestation of the intellectual powers, and as the result is identical with that of the other classes of causes, it is warrantable to connect it with them, on pathological principles more than as a mere matter of convenience.

Dr Ireland, in his work *On Idiocy and Imbecility* (1877), classifies idiots from the standpoint of pathology as follows: (1) Genetous idiocy: in this form, which he holds to be complete before birth, he believes the presumption of heredity to be stronger than in other forms; the vitality of the general system is stated to be lower than normal; the palate is arched and narrow, the teeth misshapen, irregular and prone to decay and the patient dwarfish in appearance; the head is generally unsymmetrical and the commissures occasionally atrophied; (2) Microcephalic idiocy, a term which explains itself; (3) Eclampsic idiocy, due to the effects of infantile convulsions; (4) Epileptic idiocy; (5) Hydrocephalic idiocy, a term which explains itself; (6) Paralytic idiocy, a rare form, due to the brain injury causing the paralysis; (7) Traumatic idiocy, a form produced by the third class of causes above mentioned; (8) Inflammatory idiocy; (9) Idiocy by deprivation of one or more of the special senses.

The general conformation of the idiot is generally imperfect; he is sometimes deformed, but more frequently the frame is merely awkwardly put together, and he is usually of short stature. Only about one-fourth of all idiots have heads smaller than the average. Many cases are on record in which the cranial measurements exceed the average. It is the irregularity of development of the bones of the skull, especially at the base, which marks the condition. Cases, however, often present themselves in which the skull is perfect in form and size. In such the mischief has begun in the brain matter. The palate is often highly arched; hare-lip is not uncommon; in fact congenital defect or malformation of other organs than the brain is more commonly met with among idiots than in the general community. Of the special senses, hearing is most frequently affected. Sight is good, although co-ordination may be defective. Many are mute. On account of the mental dullness it is difficult to determine whether the senses of touch, taste and smell suffer impairment; but the impression is that their acuteness is below the average. It is needless to attempt a description of the mental phenomena of idiots, which range between utter want of intelligence and mere weakness of intellect.

The term *Imbecility* has been conventionally employed to indicate the less profound degrees of idiocy, but in point of fact no distinct line of demarcation can be drawn between the conditions. As the scale of imbeciles ascends it is found that the condition is evidenced not so much by obtuseness as by irregularity of intellectual development. This serves to mark the difference between the extreme stupidity of the lowest of the healthy and the highest forms of the morbidly deprived type. The two conditions do not merge gradually one into the other. Absolute stupidity and sottishness mark many cases of idiocy, but only in the lowest type, where no dubiety of opinion can exist as to its nature, and in a manner which can never be mistaken for the dulness of the man who is less talented than the average of mankind. Where in theory the morbid (in the sense of deprivation) and the healthy types might be supposed to approach each other, in practice we find that, in fact, no debatable ground exists. The uniformity of dulness of the former stands in marked opposition to the irregularity of mental conformation in the latter. Comparatively speaking, there are few idiots or imbeciles who are uniformly deprived of mental power; some may be utterly sottish, living a mere vegetable existence, but every one must have heard of the quaint and crafty sayings of manifest idiots, indicating the presence of no mean power of applied observation. In institutions for the treatment of idiots and imbeciles, children are found not only able to read and write, but even capable of applying the simpler rules of arithmetic. A man may possess a very considerable meed of receptive faculty and yet be idiotic in respect of the power of application; he may be physically disabled from relation, and so be manifestly a deprived person, unfit to take a position in the world on the same platform as his fellows.

Dr Ireland subdivides idiots, for the purpose of education, into five grades, the first comprising those who can neither speak nor understand speech, the second those who can understand a few easy words, the third those who can speak and can be taught to work, the fourth those who can be taught to read and write, and the fifth those who can read books for themselves. The treatment of idiocy and imbecility consists almost entirely of attention to hygiene and the building up of the enfeebled constitution, along with endeavours to develop what small amount of faculty exists by patiently applied educational influences. The success which has attended this line of treatment in many public and private institutions has been very considerable. It may be safely stated that most idiotic or imbecile children have a better chance of amelioration in asylums devoted to them than by any amount of care at home.

In the class of idiots just spoken of, imperfect development of the intellectual faculties is the prominent feature, so prominent that it masks the arrest of potentiality of development of the moral sense, the absence of which, even if noticed, is regarded as relatively unimportant; but, in conducting the practical study of congenital idiots, a class presents itself in which the moral sense is wanting or deficient, whilst the intellectual powers are apparently up to the average. It is the custom of writers on the subject to speak of "intellectual" and "moral" idiots. The terms are convenient for clinical purposes, but the two conditions cannot be dissociated, and the terms therefore severally only imply a specially marked deprivation of intellect or of moral sense in a given case. The everyday observer has no difficulty in recognizing as a fact that deficiency in receptive capacity is evidence of imperfect cerebral development; but it is not so patent to him that the perception of right or wrong can be compromised through the same cause, or to comprehend that loss of moral sense may result from disease. The same difficulty does not present itself to the pathologist; for, in the case of a child born under circumstances adverse to brain development, and in whom no process of education can develop an appreciation of what is right or wrong, although the intellectual faculties appear to be but slightly blunted, or not blunted at all, he cannot avoid connecting the physical peculiarity with the pathological evidence. The world is apt enough to refer any fault in intellectual development, manifested by imperfect receptivity, to a definite physical cause, and is willing to base opinion on comparatively slight data; but it is not so ready to accept the theory of a pathological implication of the intellectual attributes concerned in the perception of the difference between right and wrong. Were, however, two cases pitted one against another—the first one of so-called intellectual, the second one of so-called moral idiocy—it would be found that, except as regards the psychical manifestations, the cases might be identical. In both there might be a family history of tendency to degeneration, a peculiar cranial conformation, a history of previous symptoms during infancy, and of a series of indications of mental incapacities during adolescence, differing only in this, that in the first the prominent indication of mental weakness was inability to add two and two together, in the second the prominent feature was incapacity to distinguish right from wrong. What complicates the question of moral idiocy is that many of its subjects can, when an abstract proposition is placed before them, answer according to the dictates of morality, which they may have learnt by rote. If asked whether it is right or wrong to lie or steal they will say it is wrong; still, when they themselves are detected in either offence, there is an evident non-recognition of its concrete nature. The question of moral idiocy will always be a moot one between the casuist and the pathologist; but, when the whole natural history of such cases is studied, there are points of differentiation between their morbid depravation and mere moral depravity. Family history, individual peculiarities, the general bizarre nature of the phenomena, remove such cases from the category of crime.

Statistics.—According to the census returns of 1901 the total number of persons described as idiots and imbeciles in England and Wales was 48,882, the equality of the sexes being remarkable, namely, 24,480 males and 24,402 females. Compared with the entire population the ratio is 1 idiot or imbecile to 665 persons, or 15 per 10,000 persons living. Whether the returns are defective, owing to the sensitiveness of persons who would desire to conceal the occurrence of idiocy in their families, we have no means of knowing; but such a feeling is no doubt likely to exist among those who look upon mental infirmity as humiliating, rather than as one of the many physical evils which afflict humanity. Dr. Ireland estimates that there is 1 idiot or imbecile to every 500 persons in countries that have a census. The following table shows the number of idiots according to official returns of the various countries:—

	Males.	Females.	Total.	Proportion to 100,000 of Pop.
England and Wales	24,480	24,402	48,882	150
Scotland	3,246	3,377	6,623	148
Ireland	2,946	2,270	5,216	117
France (including cretins) (1872) .	20,456	14,677	35,133	97
Germany (1871) . .	—	—	33,739	82
Sweden (1870) . .	—	—	1,632	38
Norway (1891) . .	1,357	1,074	2,431	121
Denmark (1888–89).	2,106	1,751	3,857	200

For the United States there are no later census figures than 1890 when the feeble-minded or idiotic were recorded as 95,571 (52,940 males and 42,631 females). In 1904 (*Special Report of Bureau of Census*, 1906) the "feeble-minded" were estimated at 150,000.

The relative frequency of congenital and acquired insanity in various countries is shown in the following table, taken from Koch's statistics of insanity in Württemberg, which gives the number of idiots to 100 lunatics:—

Prussia	158	France	66
Bavaria	154	Denmark . . .	58
Saxony	162	Sweden	22
Austria	53	Norway	65
Hungary	140	England and Wales	74
Canton of Bern .	117	Scotland . . .	68
America	79	Ireland	69

It is difficult to understand the wide divergence of these figures, except it be that in certain states, such as Prussia and Bavaria, dements have been taken along with aments and in others cretins.

This cannot, however, apply to the case of France, which is stated to have only 66 idiots to every 100 lunatics. In many districts of France cretinism is common; it is practically unknown in England, where the proportion of idiots is stated as higher than in France; and it is rare in Prussia, which stands at 158 idiots to 100 lunatics. Manifestly imperfect as this table is, it shows how important an element idiocy is in social statistics; few are aware that the number of idiots and that of lunatics approach so nearly.

II. *Acquired Insanity.*—So far as the mental symptoms of acquired insanity are concerned, Pinel's ancient classification, into *Mania*, *Melancholia* and *Dementia*, is still applicable to every case, and although numberless classifications have been advanced they are for the most part merely terminological variations. Classifications of the insanities based on pathology and etiology have been held out as a solution of the difficulty, but, so far, pathological observations have failed to fulfil this ideal, and no thoroughly satisfactory pathological classification has emerged from them.

Acquired Insanity.

Classifications are after all matters of convenience; the following system admittedly is so:—

Melancholia.
Mania.
Delusional Insanity.
Katatonia.
Hebephrenia.
Traumatic Insanity.
Insanity following upon arterial degeneration.
Insanities associated or caused by: General Paralysis; Epilepsy.
Insanities associated with or caused by Alcoholic and Drug intoxication: Delirium Tremens, Chronic Alcoholic Insanity, Dipsomania, Morphinism.

Senile Insanity.—The general symptoms of acquired insanity group themselves naturally under two heads, the physical and the mental.

The physical symptoms of mental disease generally, if not invariably, precede the onset of the mental symptoms, and the patient may complain of indefinite symptoms of malaise for weeks and months before it is suspected that the disorder is about to terminate in mental symptoms. The most general physical disorder common to the onset of all the insanities is the failure of nutrition, *i.e.* the patient rapidly and apparently without any apparent cause loses weight. Associated with this nutritional failure it is usual to have disturbances of the alimentary tract, such as loss of appetite, dyspepsia and obstinate constipation. During the prodromal stage of such conditions as mania and melancholia the digestive functions of the stomach and intestine are almost or completely in abeyance. To this implication of other systems consequent on impairment of the trophesial (nourishment-regulating) function of the brain can be traced a large number of the errors which exist as to the causation of idiopathic melancholia and mania. Very frequently this secondary condition is set down as the primary cause; the insanity is referred to derangements of the stomach or bowels, when in fact these are, concomitantly with the mental disturbance, results of the cerebral mischief. Doubtless these functional derangements exercise considerable influence on the progress of the case by assisting to deprave the general economy, and by producing depressing sensations in the region of the stomach. To them may probably be attributed, together with the apprehension of impending insanity, that phase of the disease spoken of by the older writers as the *stadium melancholicum*, which so frequently presents itself in incipient cases.

General symptoms.

The skin and its appendages—the hair and the nails—suffer in the general disorder of nutrition which accompanies all insanities. The skin may be abnormally dry and scurfy or moist and offensive. In acute insanities rashes are not uncommon, and in chronic conditions, especially conditions of depression, crops of papules occur on the face, chest and shoulders. The hair is generally dry, loses its lustre and becomes brittle. The nails become deformed and may exhibit either excessive and irregular or diminished growth.

Where there are grave nutritional disorders it is to be expected that the chief excretions of the body should show departures from the state of health. In this article it is impossible to treat this subject fully, but it may suffice to say that in many states of depression there is a great deficiency in the excretion of the solids of the urine, particularly the nitrogenous waste products of the body; while in conditions of excitement there is an excessive output of the nitrogenous waste products. It has lately been pointed out that in many forms of insanity indoxyl is present in the urine, a substance only present when putrefactive processes are taking place in the intestinal tract.

The nervous system, both on the sensory and motor side, suffers very generally in all conditions of insanity. On the sensory side the special senses are most liable to disorder of their function, whereby false sense impressions arise which the patient from impairment of judgment is unable to correct, and hence arise the psychical symptoms known as hallucinations and delusions. Common sensibility is generally impaired.

On the motor side, impairment of the muscular power is present in many cases of depression and in all cases of dementia. The incontinence of urine so frequently seen in dementia and in acute insanity complicated with the mental symptom of confusion depends partly on impairment of muscular power and partly on disorder of the sensory apparatus of the brain and spinal cord.

The outstanding mental symptom in nearly all insanities, acute and recent or chronic, is the failure of the capacity of judgment and loss of self-control. In early acute insanities, however, the two chief symptoms which are most evident and easily noted are depression on the one hand and excitement or elevation on the other. Some distinction ought to be made between these two terms, excitement and elevation, which at present are used synonymously. Excitement is a mental state which may be and generally is associated with confusion and mental impairment, while elevation is an exaltation of the mental faculties, a condition in which there is no mental confusion, but rather an unrestrained and rapid succession of fleeting mental processes.

The symptoms which most strongly appeal to the lay mind as conclusive evidence of mental disorder are hallucinations and delusions. Hallucinations are false sense impressions which occur without normal stimuli. The presence of hallucinations certainly indicates some functional disorder of the higher brain centres, but is not an evidence of insanity so long as the sufferer recognizes that the hallucinations are false sense impressions. So soon, however, as conduct is influenced by hallucinations, then the boundary line between sanity on the one hand and insanity on the other has been crossed. The most common hallucinations are those of sight and hearing.

Delusions are not infrequently the result of hallucinations. If the hallucinations of a melancholic patient consist in hearing voices which make accusatory statements, delusions of sin and unworthiness frequently follow. Hallucinations of the senses of taste and smell are almost invariably associated with the delusion that the patient's food is being poisoned or that it consists of objectionable matter. On the other hand, many delusions are apparently the outcome of the patient's mental state. They may be pleasant or disagreeable according as the condition is one of elevation or depression. The intensity and quality of the delusions are largely influenced by the intelligence and education of the patient. An educated man, for instance, who suffers from sensory disturbances is much more ingenious in his explanations as to how these sensory disturbances result from electricity, marconigrams, X-rays, &c., which he believes are used by his enemies to annoy him, than an ignorant man suffering from the same abnormal sensations. Loss of self-control is characteristic of all forms of insanity. Normal self-control is so much a matter of race, age, the state of health, moral and physical upbringing, that it is impossible to lay down any law whereby this mental quality can be gauged, or to determine when deficiency has passed from a normal to an abnormal state. In many cases of insanity there is no difficulty in appreciating the pathological nature of the deficiency, but there are others in which the conduct is otherwise so rational that one is apt to attribute the deficiency to physiological rather than to pathological causes. Perversion of the moral sense is common to all the insanities, but is often the only symptom to be noticed in cases of imbecility and idiocy, and it as a rule may be the earliest symptom noticed in the early stages of the excitement of manic-depressive insanity and general paralysis.

The tendency to commit suicide, which is so common among the insane and those predisposed to insanity, is especially prevalent in patients who suffer from depression, sleeplessness and delusions of persecution. Suicidal acts may be divided into accidental, impulsive and premeditated. The accidental suicides occur in patients who are partially or totally unconscious of their surroundings, and are generally the result of terrifying hallucinations, to escape from which the patient jumps through a window or runs blindly into water or some other danger. Impulsive suicides may be prompted by suddenly presented opportunities or means of self-destruction, such as the sight of water, fire, a knife, cord or poison. Premeditated suicides most frequently occur in states of long continued depression. Such patients frequently devote their attention to only one method of destruction and fail to avail themselves of others equally practicable. As a rule the more educated the patient, the more ingenious and varied are the methods adopted to attain the desired result.

The faculty of attention is variously affected in the subjects of insanity. In some the attention is entirely subjective, being occupied by sensations of misery, depression or sensory disturbances. In others the attention is objective, and attracted by every accidental sound or movement. In most of the early acute insanities the capacity of attention is wholly abolished, while in hebephrenia the stage of exhaustion which follows acute excitement, and the condition known as secondary dementia, loss of the power of attention is one of the most prominent symptoms. The memory for both recent and remote events is impaired or abolished in all acute insanities which are characterized by confusion and loss or impairment of consciousness. In the excited stage of manic-depressive insanity it is not uncommon to find that the memory is abnormally active. Loss of memory for recent but not remote events is characteristic of chronic alcoholism and senility and even the early stage of general paralysis.

Of all the functions of the brain that of sleep is the most liable to disorder in the insane. Sleeplessness is the earliest symptom in the onset of insanity; it is universally present in all the acute forms, and the return of natural sleep is generally the first symptom of recovery. The causes of sleeplessness are very numerous, but in the majority of acute cases the sleeplessness is due to a state of toxaemia. The toxins act either directly on the brain cells producing a state of irritability incompatible with sleep, or indirectly, producing physical symptoms which of themselves alone are capable of preventing the condition of sleep. These symptoms are high arterial tension and a rapid pulse-rate. The arterial tension of health ranges between 110 and 120 millimetres of mercury, and when sleep occurs the arterial tension falls and is rarely above 100 millimetres. In observations conducted by Bruce (*Scottish Medical and Surgical Journal*, August 1900) on cases of insanity suffering from sleeplessness the arterial tension was found to be as high as 140 and 150 millimetres. When such sleep was obtained the tension always sank at once to 110 millimetres or even lower. In a few cases suffering from sleeplessness the arterial tension was found to be below 100 millimetres, accompanied by a rapid pulse-rate. When sleep set in, in these cases, no alteration was noted in the arterial tension, but the pulse was markedly diminished.

Melancholia.

MELANCHOLIA.—Melancholia is a general term applied to all forms of insanity in which the prevailing mental symptom is that of depression and dates back to the time of Hippocrates. Melancholic patients, however, differ very widely from one another in their mental symptoms, and as a consequence a perfectly unwarrantable series of subdivisions have been invented according to the prominence of one or other mental symptoms. Such terms as delusional melancholia, resistive melancholia, stuporose melancholia, suicidal melancholia, religious melancholia, &c. have so arisen; they are, however, more descriptive of individual cases than indicative of types of disease.

So far as our present knowledge goes, at least three different and distinct disease conditions can be described under the general term melancholia. These are, acute melancholia, excited melancholia and the state of depression occurring in *Folie circulaire* or alternating insanity, a condition in which the patient is liable to suffer from alternating attacks of excitement and depression.

Acute Melancholia is a disease of adult life and the decline of life. Women appear to be more liable to be attacked than men. Hereditary predisposition, mental worry, exhausting occupations, such as the sick-nursing of relatives, are the chief predisposing causes, while the direct exciting cause of the condition is due to the accumulation in the tissues of waste products, which so load the blood as to act in a toxic manner on the cells and fibres of the brain.

The onset of the disease is gradual and indefinite. The patient suffers from malaise, indigestion, constipation and irregular, rapid and forcible action of the heart. The urine become scanty and high coloured. The nervous symptoms are irritability, sleeplessness and a feeling of mental confusion. The actual onset of the acute mental symptoms may be sudden, and is not infrequently heralded by distressing hallucinations of hearing, together with a rise in the body temperature. In the fully developed disease the patient is flushed and the skin hot and dry; the temperature is usually raised 1° above the normal in the evening. The pulse is hard, rapid and often irregular. There is no desire for food, but dryness of the mouth and tongue promote a condition of thirst. The bowels are constipated. The urine is scanty and frequently contains large quantities of indoxyl. The blood shows no demonstrable departure from the normal. The patient is depressed, the face has a strained, anxious expression, while more or less mental confusion is always present. Typical cases suffer from distressing aural hallucinations, and the function of sleep is in abeyance.

Acute melancholia may terminate in recovery either gradually or by crises, or the condition may pass into chronicity, while in a small proportion of cases death occurs early in the attack from exhaustion and toxaemia. The acute stage of onset generally lasts for from two to three weeks, and within that period the patient may make a rapid and sudden recovery. The skin becomes moist and perspiration is often profuse. Large quantities of urine are excreted, which are laden with waste products. The pulse becomes soft and compressible, sleep returns, and the depression, mental confusion and hallucinations pass away. In the majority of untreated cases, however, recovery is much more gradual. At the end of two or three weeks from the onset of the attack the patient gradually passes into a condition of comparative tranquillity. The skin becomes moister, the pulse less rapid, and probably the earliest symptom of improvement is return of sleep. Hallucinations accompanied by delusions persist often for weeks and months, but as the patient improves physically the mental symptoms become less and less prominent.

If the patient does not recover, the physical symptoms are those of mal-nutrition, together with chronic gastric and intestinal disorder. The skin is dull and earthy in appearance, the hair dry, the nails brittle and the heart's action weak and feeble. Mentally there is profound depression with delusions, and persistent or recurring attacks of hallucinations of hearing. When death occurs, it is usually preceded by a condition known as the "typhoid state." The patient rapidly passes into a state of extreme exhaustion, the tongue is dry and cracked, sordes form upon the teeth and lips, diarrhoea and congestion of the lungs rapidly supervene and terminate life.

Treatment.—The patient in the early stage of the disease must be confined to bed and nursed by night as well as day. The food to begin with should be milk, diluted with hot water or aerated water, given frequently and in small quantities. The large intestine should be thoroughly cleared out by large enemata and kept empty by large normal saline enemata administered every second day. Sleep may be secured by lowering the blood pressure with half-grain doses of erythrol-tetra-nitrate. If a hypnotic is necessary, as it will be if the patient has had no natural sleep for two nights in succession, then a full dose of paraldehyde or veronal may be given at bed-time. Under this treatment the majority of cases, if treated early, improve rapidly. As the appetite returns great care must be taken that the patient does not suddenly resume a full ordinary dietary. A sudden return to a full dietary invariably means a relapse, which is often less amenable to treatment than the original attack. Toast should first be added to the milk, and this may be followed by milk puddings and farinaceous foods in small quantities. Any rise of temperature or increase of pulse-rate or tendency to sleeplessness should be regarded as a threatened relapse and treated accordingly.

Excited Melancholia.—Excited melancholia is almost invariably a disease of old age or the decline of life, and it attacks men and women with equal frequency. Chronic gastric disorders, deficient food and sleep, unhealthy occupations and environments, together with worry and mental stress, are all more or less predisposing causes of the disease. The direct exciting cause or causes have not as yet been demonstrated, but there is no doubt that the disease is associated with, or caused by, a condition of bacterial toxaemia, analogous to the bacterial toxaemias of acute and chronic rheumatism.

The onset of the disease is always gradual and is associated with mal-nutrition, loss of body weight, nervousness, depression, loss of the capacity for work, sleeplessness and attacks of restlessness. These attacks of restlessness become more and more marked as self-control diminishes, and as the depression increases the disease passes the borderland of sanity.

In the fully developed disease the appearance of the patient is typical. The expression is drawn, depressed, anxious or apprehensive. The skin is yellow and parchment like. The hair is often dry and stands out stiffly from the head. The hands are in constant movement, twisting and untwisting, picking the skin, pulling at the hair or tearing at the clothes. The patient moans continuously, or emits cries of grief and wanders aimlessly. Mentally the patient, although depressed, miserable and self-absorbed, is not confused. There is complete consciousness except during the height of a paroxysm of restlessness and depression, and the patient can talk and answer questions clearly and intelligently, but takes no interest in the environment. Some of the patients suffer from delusions, generally a sense of impending danger, but very few suffer from hallucinations.

Physically there is loss of appetite, constipation and rapid heart action, a great increase in the number of the white blood corpuscles, particularly of the multinucleated cells which are frequently increased in bacterial infections. In the blood serum also there can be demonstrated the presence of agglutinines to certain members of the streptococci group.

The course of the disease is prolonged and chronic. The acute symptoms tend to remit at regular intervals, the patient becoming more quiet and less demonstratively depressed; but as a rule these remissions are extremely temporary. Excited melancholia is a disease characterized by repeated relapses, and recoveries are rare in cases above the age of forty.

Treatment.—There is no curative treatment for excited melancholia. The patient must be carefully nursed; kept in bed during the exacerbations of the disease and treated with graduated doses of nepenthe or tincture of opium, to secure some amelioration of the acute symptoms. Careful dieting, tonics and baths are of benefit during the remissions of the disease, and in a few cases seem to promote recovery.

Folie circulaire, or alternating insanity, was first described by Falret and Baillarger, and more recently Kraepelin has considerably widened the conception of this class of disease, which he describes under the term "manic-depressive insanity." Of the two terms (*folie circulaire* and manic-depressive insanity) the latter is the more correct. *Folie circulaire* implies that the disease invariably passes through a complete cycle, which description is only applicable to very few of the cases. Manic-depressive insanity implies that the patient may either suffer from excitement or depression which do not necessarily succeed one another in any fixed order. As a matter of fact, the majority of patients who suffer from the disease either have marked excited attacks with little or no subsequent depression, or marked attacks of depression with a subsequent period of such slight exaltation as hardly to be distinguished from a state of health.

Depression of the manic-depressive variety, therefore, may either precede or follow upon an attack of maniacal excitement, or it may be the chief and only obvious symptom of the disease and may recur again and again. The disease attacks men and women with equal frequency, and as a rule manifests itself either late in adolescence or during the decline of life. Hereditary predisposition has been proved to exist in over 50 % of cases, beyond which no definite predisposing cause is at present known. A considerable number of cases follow upon attacks of infective disease such as typhoid fever, scarlet fever or rheumatic fever. The actual exciting cause is probably an intestinal toxaemia of bacterial origin; at all events, mal-nutrition, gastric and intestinal symptoms not infrequently precede an attack, and the condition of the blood—the increase in number in the multinucleated white blood corpuscles and the presence of agglutinines to certain members of the streptococci group of bacteria—are symptoms which have been definitely demonstrated by Bruce in every case so far examined.

If the depression is the sequel to an attack of excitement, the onset may be very sudden or it may be gradual. If, on the other hand, the depression is not the sequel of excitement, the onset is very gradual and the patient complains of lassitude, incapacity for mental or physical work, loss of appetite, constipation and sleeplessness often for months before the case is recognized as one of insanity. In the fully developed disease the temperature is very rarely febrile, on the contrary it is rather subnormal in character. The stomach is disordered and the bowels confined. The urine is scanty, turbid and very liable to rapid decomposition. The heart's action is slow and feeble and the extremities become cold, blue and livid. In extreme cases gangrene of the lower extremities may occur, but in all there is a tendency to oedema of the extremities. The skin is greasy, often offensive, and the palms of the hands and the soles of the feet are sodden.

Mentally there is simple depression, without, in the majority of cases, any implication of consciousness. Many patients pass through attack after attack without suffering from hallucinations or delusions, but in rare cases hallucinations of hearing and sight are present. Delusions of unworthiness and unpardonable sin are not uncommon, and if once expressed are liable to recur again during the course of each successive attack. The disease is prolonged and chronic in its course, and the condition of the patient varies but little from day to day. When the depression follows excitement, the patient as a rule becomes fat and flabby. On the other hand, if the illness commences with depression, the chief physical symptoms are mal-nutrition and loss of body weight, and the return to health is always preceded by a return of nutrition and a gain in body weight.

The attacks may last from six months to two or three years. The intervals between attacks may last for only a few weeks or months or may extend over several years. During the interval the patient is not only capable of good mental work but may show capacity of a high order. In other words this form of mental disorder does not tend to produce dementia; the explanation probably being that between the attacks there is no toxaemia.

Treatment.—There is no known curative treatment for the depression of manic-depressive insanity, but the depression, the sleeplessness and the gastric disorder are to some extent mitigated by common sense attention to the general health of the body. If the patient is thin and wasted, then treatment is best conducted in bed. The diet should be bland, consisting largely of milk, eggs and farinaceous food, given in small quantities and frequently. Defecation should be maintained by enemata, and the skin kept clean by daily warm baths. What is of much more importance is the fact that in some instances subsequent attacks can be prevented by impressing upon the patient the necessity for attending to the state of the bowels, and of discontinuing work when the slightest symptoms of an attack present themselves. If these symptoms are at all prominent, rest in bed is a wise precaution, butcher-meat should be discontinued from the dietary and a tonic of arsenic or quinine and acid prescribed.

MANIA.—The term mania, meaning pathological elevation or excitement, has, like the term melancholia, been applied to all varieties of morbid mental conditions in which the prevailing mental symptom is excitement or elevation. As in melancholia so in mania various subdivisions have been invented, such as delusional mania, religious mania, homicidal mania, according to the special mental characteristics of each case, but such varieties are of accidental origin and cannot be held to be subdivisions.

Mania.

Under the term mania two distinct diseased conditions can be described, viz. acute mania, and the elevated stage of *folie circulaire* or manic-depressive insanity.

Acute Mania.—Acute mania is a disease which attacks both sexes at all ages, but its onset is most prevalent during adolescence and early adult life. Hereditary predisposition, physical and mental exhaustion, epileptic seizures and childbirth are all predisposing causes. The direct exciting cause or causes are unknown, but the physical symptoms suggest that the condition is one of acute toxaemia or poisoning, and the changes in the blood are such as are consequent on bacterial toxaemia.

The onset is gradual in the large majority of cases. Histories of sudden outbursts of mania can rarely be relied on, as the illness is almost invariably preceded by loss of body weight, sleeplessness, bad dreams, headaches and symptoms of general malaise, sometimes associated with depression. The actual onset of the mental symptoms themselves, however, are frequently sudden.

A typical case of the fully developed disease is not easily mistaken. The patient is usually anaemic and thin, the expression of the face is unnatural, the eyes widely opened and bright; and there is great motor restlessness, the muscular movements being purposeless and inco-ordinate. This inco-ordination of movement affects not only the muscles of the limbs and trunk but also those of expression, so that the usual aspect of the face becomes entirely altered. The temperature is generally slightly febrile. The tongue and lips are cracked and dry through excessive shouting or speaking. There is often no desire for food or drink. The heart's action is rapid and forcible. The skin is soft and moist. The urine is scanty, turbid and loaded with urates. The white blood corpuscles per cubic millimetre of blood are markedly increased, and the blood serum contains agglutinines to certain strains of streptococci which are not present in healthy persons. Sensibility to pain is lost or much impaired. Such patients will swing and jerk a broken limb apparently unaware that it is broken. Sleep is absent or obtained in short snatches, and even when asleep the patient is often restless and talkative as if the disease processes were still active.

Mentally the patient is excited, often wildly so, quite confused and unable to recognize time or place. Answers to questions may sometimes be elicited by repeated efforts to engage the attention of the patient. The speech is incoherent, and for all practical purposes the patient is mentally inaccessible. This state of acute excitement lasts usually for two or three weeks and gradually passes into a condition of chronic restlessness and noise, in which the movements are more co-ordinate and purposeful. The confusion of the acute stage passes off and the attention can be more readily attracted but cannot be concentrated on any subject for any length of time. The patient will now recognize friends, but the affections are in abeyance and the memory is defective. The appetite becomes insatiable, but the patient does not necessarily gain in weight. This stage of subacute excitement may last for months, but as a rule favourable cases recover within six months from the onset of the disease. A recovering patient gradually gains weight, sleeps soundly at night and has periods of partial quiescence during the day, particularly in the morning after a good night's sleep. These lucid intervals become more and more prolonged and finally pass into a state of sanity. Some cases on the other hand, after the acute symptoms decline, remain confused, and this state of confusion may last for months; by some alienists it is described as secondary stupor.

The symptoms detailed above are those typical of an attack such as is most frequently met with in adult cases. Acute mania, however, is a disease which presents itself in various forms. Adolescent cases, for instance, very commonly suffer from recurrent attacks, and the recurrent form of the disease is also to be met with in adults. The recurrent form at the onset does not differ in symptoms from that already described, but the course of the attack is shorter and more acute, so that the patient after one or two weeks of acute excitement rapidly improves, the mental symptoms pass off and the patient is apparently perfectly recovered. An examination of the blood, however, reveals the fact that the patient is still suffering from some disorder of the system, inasmuch as the white blood corpuscles remain increased above the average of health. Subsequent attacks of excitement come on without any obvious provocation. The pulse becomes fast and the face flushed. The patient frequently complains of fullness in the head, ringing in the ears and a loss of appetite. Sleeplessness is an invariable symptom. Self-control is generally lost suddenly, and the patient rapidly passes into a state of delirious excitement, to recover again, apparently, in the course of a few weeks. Recurrent mania might therefore be regarded as a prolonged toxaemia, complicated at intervals by outbursts of delirious excitement. Acute mania in the majority of cases ends in recovery. In the continuous attack the recovery is gradual. In the recurrent cases the intervals between attacks become longer and the attacks less severe until they finally cease. In such recovered cases very frequently a persistent increase in the number of the white blood corpuscles is found, persisting for a period of two or three years of apparently sound mental health. A few cases die, exhausted by the acuteness of the excitement and inability to obtain rest by the natural process of sleep. When death does occur in this way the patient almost invariably passes into the typhoid state.

The residue of such cases become chronic, and chronicity almost invariably means subsequent dementia. The chronic stage of acute mania may be represented by a state of continuous subacute excitement in which the patient becomes dirty and destructive in habits and liable from time to time to exacerbations of the mental symptoms. Continuous observation of the blood made in such cases over a period extending for weeks reveals the fact that the leucocytosis, if represented in chart form, shows a regular sequence of events. Just prior to the onset of an exacerbation the leucocytosis is low. As the excitement increases in severity the leucocytosis curve rises, and just before improvement sets in there may be a decided rise in the curve and then a subsequent fall; but this fall rarely reaches the normal line. In other cases, which pass into chronicity, a state of persistent delusion, rather than excitement, is the prevailing mental characteristic, and these cases may at recurrent intervals become noisy and dangerous.

Treatment.—Acute mania can only be treated on general lines. During the acute stage of onset the patient should be placed in bed. If there is difficulty in inducing the patient to take a sufficient quantity of food, this difficulty can be got over by giving food in liquid form, milk, milk-tea, eggs beaten up in milk, meat juice and thin gruel, and it is always better to feed such a patient with small quantities given frequently. Cases of mania following childbirth are those which most urgently demand careful and frequent feeding, artificially administered if necessary. If there is any tendency to exhaustion, alcoholic stimulants are indicated, and in some cases strychnine, quinine and cardiac tonics are highly beneficial. The bowels should be unloaded by large enemata or the use of saline purgatives. The continuous use of purgatives should as a rule be avoided, as they drain the system of fluids. On the other hand, the administration of one large normal saline enema by supplying the tissues with fluids, and probably thereby diluting the toxins circulating in the system, gives considerable relief. A continuous warm bath frequently produces sleep and reduces excitement. The sleeplessness of acute mania is best treated by warm baths wherever possible, and if a drug must be administered, then paraldehyde is the safest and most certain, unless the patient is also an alcoholic, when chloral and bromide is probably a better sedative.

The Elevated Stage of Folie Circulaire or Manic Depressive Insanity.—As previously mentioned in the description of the depressed stage of this mental disorder, the disease is equally prone to attack men and women, generally during late adolescence or in early adult life, and in a few cases first appears during the decline of life. Hereditary predisposition undoubtedly plays a large part as a predisposing cause, and after that is said it is difficult to assign any other definite predisposing causes and certainly no exciting causes. As in the stage of depression, so in the stage of excitement the first attack may closely follow upon typhoid fever, erysipelas or rheumatic fever. On the other hand many cases occur without any such antecedent disease. Another fact which has been commented upon is that these patients at the onset of an attack of excitement often appear to be in excellent physical health.

The earliest symptoms of onset are moral rather than physical. The patient changes in character, generally for the worse. The sober man becomes intemperate. The steady man of business enters into foolish, reckless speculation. There is a tendency for the patient to seek the society of inferiors and to ignore the recognized conventionalities of life and decency. The dress becomes extravagant and vulgar and the speech loud, boastful and obscene. These symptoms may exist for a considerable period before some accidental circumstance or some more than usually extravagant departure from the laws and customs of civilization draws public attention to the condition of the patient. The symptoms of the fully developed disease differ in degree in different cases. The face is often flushed and the expression unnatural. There is constant restlessness, steady loss of body weight, and sleeplessness. In very acute attacks there are frequently symptoms of gastric disorder, while in other cases the appetite is enormous, gross and perverted. The leucocytosis is above that usually met with in health, and the increase in the early stages is due to the relative and absolute increase in the multinucleated or polymorphonuclear leucocytes. The hyperleucocytosis is not, however, so high as it is in acute mania, and upon recovery taking place the leucocytosis always falls to normal. In the serum of over 80% of cases there are present agglutinines to certain strains of streptococci, which agglutinines are not present in the serum of healthy persons. The changes in the urine are those which one would expect to find in persons losing weight; the amount of nitrogenous output is in excess of the nitrogen ingested in the food.

Mentally there is always exaltation rather than excitement, and when excitement is present it is never of a delirious nature, that is to say, the patient is cognizant of the surroundings, and the special senses are abnormally acute, particularly those of sight and hearing. Hallucinations and delusion are sometimes present, but many cases pass through several attacks without exhibiting either of these classes of symptoms. The patient is always garrulous and delighted to make any chance acquaintance the confidant of his most private affairs. The mood is sometimes expansive and benevolent, interruption in the flow of talk may suddenly change the subject of the conversation or the patient may with equal suddenness fly into a violent rage, use foul and obscene language, ending with loud laughter and protestations of eternal friendship. In other words the mental processes are easily stimulated and as easily diverted into other channels. The train of thought is, as it were, constantly being changed by accidental associations. Although consciousness is not impaired, the power of work is abolished as the attention cannot be directed continuously to any subject, and yet the patient may be capable of writing letters in which facts and fiction are most ingeniously blended. A typical case will pass through the emotions of joy, sorrow and rage in the course of a few minutes. The memory is not impaired and is often hyperacute. The speech may be rambling but is rarely incoherent.

The course of the attack is in some cases short, lasting for from one to three weeks, while in others the condition lasts for years. The patient remains in a state of constant restlessness, both of body and mind, untidy or absurd in dress, noisy, amorous, vindictive, boisterously happy or virulently abusive. As time passes a change sets in. The patient sleeps better, begins to lay on flesh, the sudden mental fluctuations become less marked and finally disappear. Many of these patients remember every detail of their lives during the state of elevation, and many are acutely ashamed of their actions during this period of their illness. As a sequel to the attack of elevation there is usually an attack of depression, but this is not a necessary sequel.

The majority of patients recover even after years of illness, but the attacks are always liable to recur. Even recurrent attacks, however, leave behind them little if any mental impairment.

Treatment.—General attention to the health of the body, and an abundance of nourishing food, and, where necessary, the use of sedatives such as bromide and sulphonal, sum up the treatment of the elevated stage of manic-depressive insanity. In Germany it is the custom to treat such cases in continuous warm baths, extending sometimes for weeks. The use of warm baths of several hours' duration has not proved satisfactory.

Delusional Insanity.

Delusional Insanity.—Considerable confusion exists at the present day regarding the term delusional insanity. It is not correct to define the condition as a disease in which fixed delusions dominate the conduct and are the chief mental symptom present. Such a definition would include many chronic cases of melancholia and mania. All patients who suffer from attacks of acute insanity and who do not recover tend to become delusional, and any attempt to include and describe such cases in a group by themselves and term them delusional insanity is inadmissible. The fact that delusional insanity has been described under such various terms as progressive systematized insanity, mania of persecution and grandeur, monomanias of persecution, unseen agency, grandeur and paranoia, indicates that the disease is obscure in its origin, probably passing through various stages, and in some instances having been confused with the terminal stages of mania and melancholia. If this is admitted, then probably the best description of the disease is that given by V. Magnan under the term of "systematized delusional insanity," and it may be accepted that many cases conform very closely to Magnan's description.

The disease occurs with equal frequency in men and women, and in the majority of cases commences during adolescence or early adult life. The universally accepted predisposing cause is hereditary predisposition. As to the exciting causes nothing is known beyond the fact that certain forms of disease, closely resembling delusional insanity, are apparently associated or caused by chronic alcoholism or occur as a sequel to syphilitic infection. In the vast majority of cases the onset is lost in obscurity, the patient only drawing attention to the diseased condition by insane conduct after the delusional state is definitely established. The friends of such persons frequently affirm that the patient has always been abnormal. However, this may be, there is no doubt that in a few cases the onset is acute and closely resembles the onset of acute melancholia. The patient is depressed, confused, suffers from hallucinations of hearing and there are disturbances of the bodily health. There is generally mal-nutrition with dyspepsia and vague neuralgic pains, often referred to the heart and intestines. Even at this stage the patient may labour under delusions. These acute attacks are of short duration and the patient apparently recovers, but not uncommonly both hallucinations and delusions persist, although they may be concealed.

The second or delusional stage sets in very gradually. This is the stage in which the patient most frequently comes under medical examination. The appearance is always peculiar and unhealthy. The manner is unnatural and may suggest a state of suspicion. The nutrition of the body is below par, and the patient frequently complains of indefinite symptoms of malaise referred to the heart and abdomen. The heart's action is often weak and irregular, but beyond these symptoms there are no special characteristic symptoms.

Mentally there may be depression when the patient is sullen and uncommunicative. It will be found, however, that he always suffers from hallucinations. At first hallucinations of hearing are the most prominent, but later all the special senses may be implicated. These hallucinations constantly annoy the patient and are always more troublesome at night. Voices make accusations through the walls, floors, roofs or door. Faces appear at the window and make grimaces. Poisonous gases are pumped into the room. Electricity, Röntgen rays and marconigrams play through the walls. The food is poisoned or consists of filth. In many cases symptoms of visceral discomfort are supposed to be the result of nightly surgical operations or sexual assaults. All these persecutions are ascribed to unknown persons or to some known person, sect or class. Under the influence of these sensory disturbances the patient may present symptoms of angry excitement, impulsive violence or of carefully-thought-out schemes of revenge; but the self-control may be such that although the symptoms are concealed the behaviour is peculiar and unreasonable. It is not uncommon to find that such patients can converse rationally and take an intelligent interest in their environments, but the implication of the capacity of judgment is at once apparent whenever the subject of the persecutions is touched upon.

All cases of delusional insanity at this stage are dangerous and their actions are not to be depended upon. Assaults are common, houses are set on fire, threatening letters are written and accusations are made which may lead to much worry and trouble before the true nature of the disease is realized.

This, the second or persecutory stage of delusional insanity, may persist through life. The patient becomes gradually accustomed to the sensory disturbances, or possibly a certain amount of mental enfeeblement sets in which reduces the mental vigour. In other cases, the disease goes on to what Magnan calls the third stage or stage of grandiose delusions. The onset of this stage is in some cases gradual. The patient, while inveighing against the persecutions, hints at a possible cause. One man is an inventor and his enemies desire to deprive him of the results of his inventions.

Another is the rightful heir to a peerage, of which he is to be deprived. Women frequently believe themselves to be abducted princesses or heirs to the throne. Others of both sexes, even more ambitious, assume divine attributes and proclaim themselves Virgin Marys, Gabriels, Holy Ghosts and Messiahs. Cases are recorded in which the delusions of grandeur were of sudden onset, the patient going to bed persecuted and miserable and rising the following morning elated and grandiose. In this stage the hallucinations persist but appear to change in character and become pleasant. The king hears that arrangements are being made for his coronation and waits quietly for the event. The angel Gabriel sees visions in the heavens. The heirs and heiresses read of their prospective movements in the court columns of the daily papers and are much soothed thereby. In short, no delusion is too grotesque and absurd for such patients to believe and express.

Cases of delusional insanity never become demented in the true sense of the word, but their mental state might be described as a dream in which an imaginary existence obliterates the experiences of their past lives.

Treatment.—No treatment influences the course of the disease. During the stage of persecution such patients are a danger to themselves, as they not infrequently commit suicide, and to their supposed persecutors, whom they frequently assault or otherwise annoy.

Katatonia.

Katatonia.—This disease, so called on account of the symptom of muscular spasm or rigidity which is present during certain of its stages, was first described and named by K. L. Kahlbaum in 1874. Many British alienists refuse to accept katatonia as a distinct disease, but as it has been accepted and further elaborated by such an authority as E. Kraepelin reference to it cannot be avoided.

Katatonia attacks women more frequently than men, and is essentially a disease of adolescence, but typical cases occasionally occur in adults. Hereditary predisposition is present in over 50% of the cases and is the chief predisposing cause. Childbirth, worry, physical strain and mental shocks are all advanced as secondary predisposing causes. The disease is one of gradual onset, with loss of physical and mental energy. Probably the earliest mental symptom is the onset of aural hallucinations. For convenience of description the disease may be divided into (1) the stage of onset; (2) the stage of stupor; (3) the stage of excitement.

The symptoms of the stage of onset are disorders of the alimentary tract, such as loss of appetite, vomiting after food and obstinate constipation. The pulse is rapid, irregular and intermittent. The skin varies between extreme dryness and drenching perspirations. In women the menstrual function is suppressed. At uncertain intervals the skeletal muscles are thrown into a condition of rigidity, but this symptom does not occur invariably. The instincts of cleanliness are in abeyance, owing to the mental state of the patient, and as a result these cases are inclined to be wet and dirty in their habits.

Mentally there is great confusion, vivid hallucinations, which apparently come on at intervals and are of a terrifying nature, for the patient often becomes frightened, endeavours to hide in corners or escape by a window or door. A very common history of such a case prior to admission is that the patient has attempted suicide by jumping out of a window, the attempt being in reality an unconscious effort on the part of the patient to escape from some imaginary danger. During these attacks the skin pours with perspiration. The patient is oblivious to his surroundings and is mentally inaccessible. In the intervals between these attacks the patient may be conscious and capable of answering simple questions. This acute stage, in which sleep is abolished, lasts from a few days to four or six weeks and then, generally quite suddenly, the patient passes into the state of stupor. In some cases a sharp febrile attack accompanies the onset of the stupor, while in others this symptom is absent; but in every case examined by Bruce during the acute stage there was an increase in the number of the white blood corpuscles, which, just prior to the onset of stupor, were sometimes enormously increased; the increase being entirely due to multiplication of the multinucleated or polymorphonuclear leucocytes.

In the second or stuporose stage of the disease the symptoms are characteristic. The patient lies in a state of apparent placidity, generally with the eyes shut. Consciousness is never entirely abolished, and many of the patients give unmistakable evidence that they understand what is being said in their presence. Any effort at passive movement of a limb immediately sets up muscular resistance, and throughout this stage the sternomastoid and the abdominal muscles are more or less in a state of over-tension, which is increased to a condition of rigidity if the patient is interfered with in any way. This symptom of restiveness or negativism is one of the characteristics of the disease. The patient resists while being fed, washed, dressed and undressed, and even the normal stimuli which in a healthy man indicate that the bladder or rectum require to be emptied are resisted, so that the bladder may become distended and the lower bowel has to be emptied by enemata. The temperature is low, often subnormal, the pulse is small and weak, and the extremities cold and livid. This symptom is probably due in some part to spasm of the terminal arterioles. Mentally the symptoms are negative. Though conscious, the patient cannot be got to speak and apparently is oblivious to what is passing around. Upon recovery, however, these cases can often recount incidents which occurred to them during their illness, and may also state that they laboured under some delusion. Coincidently with the onset of the stupor sleep returns, and many cases sleep for the greater part of the twenty-four hours. The duration of the stuporose state is very variable. In some cases it lasts for weeks, in others for months or years, and may be the terminal stage of the disease, the patient gradually sinking into dementia or making a recovery. The third stage or stage of excitement comes on in many cases during the stage of stupor: the stages overlap; while in others a distinct interval of convalescence may intervene between the termination of the stupor and the onset of the excitement. The excitement is characterized by sudden impulsive actions, rhythmical repetition of words and sounds (verbigeration), and by rhythmical movements of the body or limbs, such as swaying the whole frame, nodding the head, swinging the arms, or walking in circles. The patient may be absolutely mute in this stage as in the stage of stupor. Others again are very noisy, singing, shouting or abusive. The speech is staccato in character and incoherent. Physically the patient, who often gains weight in the stage of stupor, again becomes thin and haggard in appearance owing to the incessant restlessness and sleeplessness which characterize the stage of excitement. The patient may, during the stage of onset, die through exhaustion, or accidentally and unconsciously commit suicide usually by leaping from a window. During the stuporose stage symptoms of tubercular disease of the lungs may commence. All the adolescent insane are peculiarly liable to contract and die from tubercular disease. Accidental suicide is also liable to occur during this stage. The stage of excitement, if at all prolonged, invariably ends in dementia. According to Kraepelin 13% of the cases recover, 27 make partial recoveries, and 60% become more or less demented.

Treatment.—No treatment arrests or diverts the course of katatonia, and the acute symptoms of the disease as they arise must be treated on hospital principles.

Hebephrenia.

Hebephrenia.—This is a disease of adolescence (Gr. ἥβη) which was first described by Hecker and Kahlbaum and more recently by Kraepelin and other foreign workers. Hebephrenia is not yet recognized by British alienists. The descriptions of the disease are indefinite and confusing, but there are some grounds for the belief that such an entity does exist, although it is probably more correct to say that as yet the symptoms are very imperfectly understood. Hebephrenia is always a disease of adolescence and never occurs during adult life. It attacks women more frequently than men, and according to Kahlbaum hereditary predisposition to insanity is present in over 50% of the cases attacked. The onset of the disease is invariably associated with two symptoms. On the physical side an arrested or delayed development and on the mental a gradual failure of the power of attention and concentrated thought. The onset of the condition is always gradual and the symptoms which first attract attention are mental. The patient becomes restless, is unable to settle to work, becomes solitary and peculiar in habits and sometimes dissolute and mischievous. As the disease advances the patient becomes more and more enfeebled, laughs and mutters to himself and wanders aimlessly and without object. There is no natural curiosity, no interest in life and no desire for occupation. Later, delusions may appear and also hallucinations of hearing, and under their influence the patient may be impulsive and violent. Physically the subjects are always badly developed. The temperature is at times slightly elevated and at intervals the white blood corpuscles are markedly increased. The menstrual function in women is suppressed and both male and female cases are addicted to masturbation. According to Kraepelin 5% of the cases recover, 15% are so far relieved as to be able to live at home, but are mentally enfeebled, the remaining 80% become hopelessly demented. The patients who recover frequently show at the onset of their disease acute symptoms, such as mild excitement, slightly febrile temperature and quick pulse-rate. When recovery does take place there is marked improvement in development. The subjects of hebephrenia are peculiarly liable to tubercular infection and many die of phthisis.

There is no special treatment for hebephrenia beyond attention to the general health.

Insanity following upon Injuries to the Brain, or Apoplexies or Tumours or Arterial Degeneration. (*a*) *Traumatic Insanity.*—Insanity following blows on the head is divided into (1) the forms in which the insanity immediately follows the accident; (2) the form in which there is an intermediate prodromal stage characterized by strange conduct and alteration in disposition; and (3) in which the mental symptoms occur months or years after the accident, which can have at most but a remote predisposing causal relation to the insanity. The cases which immediately succeed injuries to the head are in all respects similar to confusional insanity after operations or after fevers. There is generally a noisy incoherent delirium, accompanied by hallucinations of sight or of hearing, and fleeting unsystematized delusions. The physical symptoms present all the features of severe nervous shock.

Traumatic Insanity.

In those cases in which there is an intervening prodromal condition, with altered character and disposition, there is usually a more or less severe accidental implication of the cortex cerebri, either by depression of bone or local hemorrhage, or meningitic sub-inflammatory local lesions. Most of the cases during the prodromal stage are sullen, morose or suspicious, and indifferent to their friends and surroundings. At the end of the prodromal stage there most usually occurs an attack of acute mania of a furious impulsive kind. The cases which for many years after injury are said to have remained sane will generally be found upon examination and inquiry to exhibit symptoms of hereditary degeneration or of acquired degeneracy, which may or may not be a consequence of the accident.

The most common site of vascular lesion is one of the branches of the middle cerebral artery within the sylvian fissure, or of one of the smaller branches of the same artery which go directly to supply the chief basal ganglia. When an artery like the middle cerebral or one of its branches becomes either through rupture or blocking of its lumen, incapable of performing its function of supplying nutrition to important cerebral areas, there ensues devitality of the nervous tissues, frequently followed by softening and chronic inflammation. It is these secondary changes which give rise to and maintain those peculiar mental aberrations known as post-apoplectic insanity.

Various characteristic physical symptoms, depending upon the seat of the cerebral lesion, are met with in the course of this form of insanity. These consist of paraplegias, hemiplegias and muscular contractures. Speech defects are very common, being due either to the enfeebled mental condition, to paralysis of the nerve supplying the muscles of the face and tongue, or to aphasia caused by implication of those parts of the cortex which are intimately associated with the faculty of speech. Mental symptoms vary considerably in different cases and in accordance with the seat and extent of the lesion. There is almost always present, however, a certain degree of mental enfeeblement, accompanied by loss of memory and of judgment, often by mental confusion. Another very general mental symptom is the presence of emotionalism which leads the patient to be affected either to tears or to laughter upon trifling and inadequate occasions.

Cerebral tumours do not necessarily produce insanity. Indeed it has been computed that not one half of the cases become insane. When insanity appears it is met with in all degrees varying from slight mental dulness up to complete dementia, and from mere moral perversion up to the most intense form of maniacal excitement. On the physical side the various symptoms of cerebral tumour such as coma, ataxia, paralysis, headache, vomiting, optic neuritis and epileptiform convulsions are met with. All forms of so-called moral changes and of changes of disposition are met with as mental symptoms and all the ordinary forms of insanity may occur in varying intensity; but by far the most common mental change occurring in connexion with cerebral tumour is a progressive enfeeblement of the intelligence, unattended with any more harmful symptoms than mental deterioration which ends in complete dementia.

(*b*) *Arterial Degeneration.*—Arterial degeneration is a common cause of mental impairment, especially of that form of mental affection known as "Early" dementia. It also predisposes to embolism and thrombosis, which often results in the paralytic and aphasic groups of nerve disturbance, and which are always accompanied by more or less marked interference with normal cerebral action.

Insanity due to Arterial Degeneration.

The commonest seat for atheroma of the cerebral vessels is the arteries at the base of the brain and their main branches, especially the middle cerebral. As a general rule the other arteries of the cerebrum are not implicated to the same extent, although in a not inconsiderable number of cases of the disease all the arteries of the brain may participate in the change. When this is so, we obtain those definite symptoms of slowly advancing dementia commencing in late middle life and ending in complete dementia before the usual period for the appearance of senile dementia. The same appearances are met with in certain patients who have attained the age in which senile changes in the arteries are not unexpected. As a rule atheroma in the cerebral vessels is but a part of a general atheroma of all the arteries of the body. Atheroma is common after middle life and increases in frequency with age. The chief causes are syphilis, alcoholism, the gouty and rheumatic diatheses and above all Bright's disease of the kidneys. Perhaps certain forms of Bright's disease, owing to the tendency to raise the blood pressure, are of all causes the most common.

It is not easy to say to what extent, alone, the arteriosclerosis is effectual in inducing the gradual failure of the mental powers, and to what extent it is assisted in its operation by the action on the brain-cells of the general toxic substances which give rise to the arterial atheroma. In any case there can be no question that the gradual mechanical diminution of the blood-supply to the cortex caused by the occlusion of the lumen of the arteries is a factor of great importance in the production of mental incapacity.

General Paralysis of the Insane (syn. General Paralysis, *dementia paralytica*, progressive dementia) is a disease characterized by symptoms of progressive degeneration of the central nervous system, more particularly of the motor centres. The disease is almost invariably fatal. Apparent recoveries do very occasionally occur, though this is denied by the majority of alienists. The disease is in every case associated with gradually advancing mental enfeeblement, and very frequently is complicated by attacks of mental disease.

General Paralysis.

General paralysis, which is a very common disease, was first recognized in France; it was identified by J. E. D. Esquirol, and further described and elaborated by A. L. J. Bayle, Delaye and J. L. Calmeil, the latter giving it the name of *paralysie générale des aliénés*.

As first described by the earlier writers the disease was regarded as being invariably associated with delusions of grandeur. At the present day this description does not apply to the majority of cases admitted into asylums. The change may be explained as being either due to an alteration in the type of the disease, or more probably the disease is better understood and more frequently diagnosed than formerly, the diagnosis being now entirely dependent on the physical and not on the mental symptoms. This latter may also be the explanation why general paralysis is much more common at the present day in British asylums than it was. The total death-rate from this disease in English and Scottish asylums rose from 1321 in 1894 to 1795 in 1904.

General paralysis attacks men much more frequently than women, and occurs between the ages of 35 and 50 years. It is essentially a disease of town life. In asylums which draw their patients from country districts in Scotland and Ireland, the disease is rare, whereas in those which draw their population from large cities the disease is extremely common.

Considerable diversity of opinion exists at present regarding the causation of general paralysis. Hereditary predisposition admittedly plays a very small part in its causation. There is, however, an almost universal agreement that the disease is essentially the result of toxaemia or poisoning, and that acquired or inherited syphilitic infection is an important predisposing factor. A history of syphilitic infection occurs in from 70 to 90% of the patients affected. At first it was held that general paralysis was a late syphilitic manifestation, but as it was found that no benefit followed the use of anti-syphilitic remedies the theory was advanced that general paralysis was a secondary auto-intoxication following upon syphilitic infection. The latest view is that the disease is a bacterial invasion, to which syphilis, alcoholism, excessive mental and physical strain, and a too exclusively nitrogenous diet, only act as predisposing causes. This latter theory has been recently advanced and elaborated by Ford Robertson and McRae of Edinburgh.

Whatever the cause of general paralysis may be, the disease is essentially progressive in character, marked by frequent remissions and so typical in its physical symptoms and pathology that we regard the bacterial theory with favour, although we are far from satisfied that the actual causative factor has as yet been discovered.

For descriptive purposes the disease is most conveniently divided into three stages,—called respectively the first, second and third,—but it must be understood that no clear line of demarcation divides these stages from one another.

The onset of general paralysis is slow and gradual, and the earliest symptoms may be either physical or mental. The disease may commence either in the brain itself or the spinal cord may be primarily the seat of lesion, the brain becoming affected secondarily. When the disease originates in the spinal cord the symptoms are similar to those of locomotor ataxia, and it is now believed that general paralysis and locomotor ataxia are one and the same disease; in the one case the cord, in the other the brain, being the primary seat of lesion. The early physical symptoms are generally motor. The patient loses energy, readily becomes tired, and the capacity for finely co-ordinated motor acts, such as are required in playing games of skill, is impaired. Transient attacks of partial paralysis of a hand, arm, leg or one side of the body, or of the speech centre are not uncommon. In a few cases the special senses are affected early and the patient may complain of attacks of dimness of vision or impairment of hearing. Or the symptoms may be purely mental and affect the highest and most recently acquired attributes of man, the moral sense and the faculty of self-control. The patient then becomes irritable, bursts into violent passions over trifles, changes in character and habits, frequently takes alcohol to excess and behaves in an extravagant, foolish manner. Theft is often committed in this stage and the thefts are characterized by an open, purposeless manner of commission. The memory is impaired and the patient is easily influenced by others, that is to say he becomes facile. In other cases a wild attack of sudden excitement, following upon a period of restlessness and sleeplessness may be the first symptom which attracts attention. Whatever the mode of onset the physical symptoms which characterize the disease come on sooner or later. The speech is slurred and the facial muscles lose their tone, giving the face a flattened expression. The muscular power is impaired, the gait is straddling and the patient sways on turning. All the muscles of the body, but particularly those of the tongue, upper lip and hands, which are most highly innervated, present the symptom of fine fibrillary tremors. The pupils become irregular in outline, often unequal in size and either one or both fail to react normally to the stimuli of light, or of accommodation for near or distant vision.

As the disease advances there is greater excitability and a tendency to emotionalism. In classical cases the general exaltation of ideas becomes so great as to lead the patient to the commission of insanely extravagant acts, such as purchases of large numbers of useless articles, or of lands and houses far beyond his means, numerous indiscriminate proposals of marriage, the suggestion of utterly absurd commerical schemes, or attempts at feats beyond his physical powers. The mental symptoms, in short, are very similar to those of the elevated stage of manic-depressive insanity.

Delusions of the wildest character may also be present. The patient may believe himself to be in possession of millions of money, to be unsurpassed in strength and agility, to be a great and overruling genius, and the recipient of the highest honours. This grandiose condition is by no means present in every case and is not in itself diagnostic of the disease. But mental facility, placid contentment, complete loss of judgment and affection for family and friends, with impaired memory, are symptoms universally present. As the disease advances the motor symptoms become more prominent. The patient has great difficulty in writing, misses letters out of words, words out of sentences, and writes in a large laboured hand. The expression becomes fatuous. The speech is difficult and the facial muscles are thrown into marked tremors whenever any attempt at speech is made. The voice changes in timbre and becomes high-pitched and monotonous. The gait is weak and uncertain and the reflexes are exaggerated. In the first stage the patient, through restlessness and sleeplessness, becomes thin and haggard. As the second stage approaches sleep returns, the patient lays on flesh and becomes puffy and unhealthy in appearance. The mental symptoms are marked by greater facility and enfeeblement, while the paralysis of all the muscles steadily advances. The patient is now peculiarly liable to what are called congestive seizures or epileptiform attacks. The temperature rises, the face becomes flushed and the skin moist. Twitchings are noticed in a hand or arm. These twitchings gradually spread until they may involve the whole body. The patient is now unconscious, bathed in perspiration, which is offensive. The bowels and bladder empty themselves reflexly or become distended, and bedsores are very liable to form over the heels, elbows and back. Congestive seizures frequently last for days and may prove fatal or, on the other hand, the patient may have recurrent attacks and finally die of exhaustion or some accidental disease, such as pneumonia. In the second stage of the disease the patient eats greedily, and as the food is frequently swallowed unmasticated, choking is not an uncommon accident. The special senses of taste and smell are also much disordered. We have seen a case of general paralysis, in the second stage drink a glass of quinine and water under the impression that he was drinking whisky.

The third stage of the disease is characterized by sleeplessness and rapid loss of body weight. Mentally the patient becomes quite demented. On the physical side the paralysis advances rapidly, so that the patient becomes bed-ridden and speechless. Death may occur as the result of exhaustion, or a congestive seizure, or of some intercurrent illness.

The duration of the disease is between eighteen months and three years, although it has been known to persist for seven.

No curative measures have so far proved of any avail in the treatment of general paralysis.

INSANITY ASSOCIATED WITH EPILEPSY.—The term "epileptic insanity," which has for many years been in common use, is now regarded as a misnomer. There is in short no such disease as epileptic insanity. A brain, however, which is so unstable as to exhibit the sudden discharges of nervous energy which are known as epileptic seizures, is prone to be attacked by insanity also, but there is no form of mental disease exclusively associated with epilepsy. Many epileptics suffer from the disease for a lifetime and never exhibit symptoms of insanity. The majority of patients, however, who suffer from epilepsy are liable to exhibit certain mental symptoms which are regarded as characteristic of the disease. Some suffer from recurrent attacks of depression, ill-humour and irritability, which may readily pass into violence under provocation. Others are emotionally fervid in religious observances, though sadly deficient in the practice of the religious life. A third class are liable to attacks of semi-consciousness which may either follow upon or take the place of a seizure, and during these attacks actions are performed automatically and without consciousness on the part of the patient.

Epileptic Insanity.

When epileptics do become insane the insanity is generally one of the forms of mania. Either the patient suffers from sudden furious attacks of excitement in which consciousness is entirely abolished, or the mania is of the type of the elevated stage of folie circulaire (manic-depressive insanity) and alternates with periods of deep depression. In the elevated period the patient shows exaggerated self-esteem, with passionate outbursts of anger, and periods of religious emotionalism. While in the stage of depression the patient is often actively suicidal.

Epileptic patients who suffer from recurrent attacks of delirious mania are liable to certain nervous symptoms which indicate that not only are the motor centres in the brain damaged, but that the motor tracts in the spinal cord are also affected. The gait becomes awkward and laboured, the feet being lifted high off the ground and the legs thrown forward with a jerk. The tendon reflexes are at the same time exaggerated. These symptoms indicate descending degeneration of the motor tracts of the cord.

If the mental attacks partake of the character of elevation or depression the mental functions suffer more than the motor. These patients, in course of time, become delusional, enfeebled and childish, and in some cases the enfeeblement ends in complete dementia of a very degraded type.

Where insanity is superadded to epilepsy the prognosis is unfavourable.

INSANITY ASSOCIATED WITH OR CAUSED BY ALCOHOLIC AND DRUG INTOXICATION.—The true rôle of alcoholic indulgence in the production of insanity is at present very imperfectly understood. In many cases the alcoholism is merely a symptom of the mental disease—a result, not a cause. In others, alcohol seems to act purely as a predisposing factor, breaking down the resistance of the patient and disordering the metabolism to such an extent that bodily disorders are engendered which produce well-marked and easily recognized mental symptoms. In others, again, alcohol itself may possibly act as a direct toxin, disordering the functions of the brain. In the latter class may be included the nervous phenomena of drunkenness, which commence with excitement and confusion of ideas, and terminate in stupor with partial paralysis of all the muscles. Certain brains which, either through innate weakness or as the result of direct injury, have become peculiarly liable to toxic influences, under the influence of even moderate quantities of alcohol pass into a state closely resembling delirious mania, a state commonly spoken of as *mania a potu*.

Toxic Insanity.

Delirium Tremens.—Delirium tremens is the form of mental disorder most commonly associated with alcoholic indulgence in the lay mind. Considerable doubt exists, however, as to whether the disease is directly or secondarily the result of alcoholic poisoning. Much evidence exists in favour of the latter supposition. Delirium tremens may occur in persons who have never presented the symptom of drunkenness, or it may occur weeks after the patient has ceased to drink alcohol, and in such cases the actual exciting cause of the disease may be some accidental complication, such as a severe accident, a surgical operation, or an attack of pneumonia or erysipelas.

The early symptoms are always physical. The stomach is disordered. The desire for food is absent, and there may be abdominal pain and vomiting. The hands are tremulous, and the patient is unable to sleep. At this stage the disease may be checked by the administration of an aperient and some sedative such as bromide and chloral. The mental symptoms vary greatly in their severity. In a mild case one may talk to the patient for some time before discovering any mental abnormality, and then it will be found that confusion exists regarding his position and the identity of those around him, while the memory is also impaired for recent events. Hallucinations of sight and hearing may be present. The hallucinations of sight may be readily induced by pressure upon the eyeballs. If the symptoms are more acute they usually come on suddenly, generally during the evening or night. The patient becomes excited, suffers from vivid hallucinations of sight and hearing which produce great fear, and these hallucinations may be so engrossing as to render him quite oblivious to the environment. The hallucinations of sight are characterized by the false sense impressions taking the forms of animals or insects which surround or menace the patient. Visions may also appear in the form of flames, goblins or fairies. The hallucinations of hearing rarely consist of voices, but are more of the nature of whistlings, and ringings in the ears, shouts, groans or screams which seem to fill the air, or emanate from the walls or floors of the room. All the special senses may be affected, but sight and hearing are always implicated. Delirium tremens is a short-lived disease, generally running its course in from four to five days. Recovery is always preceded by the return of the power of sleep.

The patient must be carefully nursed and constantly watched, as homicidal and suicidal impulses are liable to occur under the terrifying influence of the hallucinations. The food should be concentrated and fluid, given frequently and in small quantities.

Chronic Alcoholic Insanity.—Almost any mental disorder may be associated with chronic alcoholism, but the most characteristic mental symptoms are delusions of suspicion and persecution which resemble very closely those of the persecution stage of systematized delusional insanity. The appearance of the patient is bloated and heavy; the tongue is furred and tremulous, and symptoms of gastric and intestinal disorder are usually present. The gait is awkward and dragging, owing to the partial paralysis of the extensor muscles of the lower limbs. All the skeletal muscles are tremulous, particularly those of the tongue, lips and hands. The common sensibility of the skin is disordered so that the patient complains of sensory disturbances, such as tinglings and prickings of the skin, which may be interpreted as electric shocks. In some cases the mental symptoms may be concealed, but delusions and hallucinations, particularly hallucinations of sight and hearing, are very commonly present. The delusions are often directly the outcome of the physical state; the disordered stomach suggesting poisoning, and the disturbances of the special senses being interpreted as various forms of persecution. The patient hears voices shouting foul abuse at him; all his thoughts are read and repeated aloud; electric shocks are sent through him at night; gases are pumped into his room. Sexual delusions are very common and frequently affect marital relations by arousing suspicions regarding the fidelity of wife or husband; or the delusions may be more gross and take the form of belief in actual attempts at sexual mutilations. The memory is always impaired.

Patients who in addition to chronic alcoholism are also insane are always dangerous and liable to sudden and apparently causeless outbursts of violence.

Dipsomania.—Dipsomania is a condition characterized by recurrent or periodic attacks of an irresistible craving for stimulants. The general bodily condition has a great deal to do with the onset of the attack, that is to say, the patient is more liable to an attack when the bodily condition is low than when the health is good. The attacks may be frequent or recur at very long intervals. They generally last for a few weeks, and may be complicated by symptoms of excitement, delusions or hallucinations.

Treatment consists in attention to the general health between attacks, with the use of such tonics as arsenic and strychnine. During the attack the patient should be confined to bed and treated with sedatives.

Morphinism.—The morphia habit is most commonly contracted by persons of a neurotic constitution. The mental symptoms associated with the disease may arise either as the result of an overdose, when the patient suffers from hallucinations, confusion and mild delirium, frequently associated with vomiting. On the other hand, mental symptoms very similar to those of delirium tremens may occur as the result of suddenly cutting off the supply of morphia in a patient addicted to the habit. Finally, chronic morphia intoxication produces mental symptons very similar to those of chronic alcoholism. This latter condition, characterized by delusions of persecution, mental enfeeblement and loss of memory, is hopelessly incurable. The patient is always thin and anaemic on account of digestive disturbances. There is weakness or slight paralysis of the lower limbs, and the skeletal muscles are tremulous.

Treatment.—The quantity of the drug used must be gradually reduced until it is finally discontinued, and during treatment the patient must be confined to bed.

Senile Insanity.

SENILE INSANITY.—States of mental enfeeblement are always the result of failure of development or of structural changes in the cortical grey matter of the brain. If the enfeeblement is due to failure of development or brain damage occurring in early life, it is spoken of as *idiocy* or imbecility. Every form of insanity which occurs after a certain period of life is apt to be regarded by some observers as senile, but although the failing mental power may colour the character of the symptoms it cannot be regarded as correct to designate, for instance, a recurrent form of mania as senile merely because it necessarily manifests itself in a subject who has lived into the senile period. On the other hand, many persons first suffer from mental derangement at an advanced period of life without at the same time manifesting any marked failure of mental power, while others only manifest their insanity as a result of the decay of their mental faculties.

From this statement it will be seen that senile insanity is a complex of different conditions, some of them accompanied by dementia, others without dementia.

Senile Dementia is distinguished occasionally into "senile" properly so called, and "presenile" dementia, which supervenes at middle age or even earlier.

The occurrence of dementia is sometimes preceded by an acute hallucinatory phase, accompanied by mania or melancholia; but as a general rule, in the presenile cases, by neurasthenia, indifference, and mental apathy which extends to a disregard for the ordinary conventions and the means of subsistence.

It has pithily been remarked that the age of a man is the age of his blood-vessels. The two conditions of senile and presenile dementia cannot therefore be separated scientifically. From a clinical point of view, however, the two are distinguishable in so far as their symptoms are concerned, for the presenile cases are more complete and the process of dementia achieves its consummation earlier and quicker, while in the senile the gradual disease of the arteries and the slow decay of the mental faculties offer a different background for the manifestation of mental symptoms. Moreover, the senile patients more frequently present symptoms of recurrent attacks of acute insanity, a more pronounced emotionalism, and a greater tendency to restlessness at night. The presenile cases, on the other hand, except at the commencement of their malady, are usually free from acute and troublesome symptoms and present chiefly an apathetic indifference and irresponsiveness on the mental side, and on the physical side a neurasthenic and enfeebled bodily state. In both conditions memory is greatly impaired.

Added to senile dementia there is often found a condition of mania or melancholia or even of systematized delusional insanity. The chief symptoms of the maniacal attacks are the great motor restlessness and excitement, which are worst during the night time. Sleep is almost always seriously disturbed, and the patients rapidly become exhausted unless carefully nursed and tended. The actions of senile maniacs are often puerile and foolish, and they may exhibit impulses of a homicidal, suicidal or sexual character. The melancholic cases are also extremely restless, and their emotion is loudly expressed in an uncontrollable manner. They often have delusions of persecution. Their cries and groans have an automatic character, as if the patient, though compelled to utter them, did not experience the mental pain which he expressed. They also, many of them, eat their food ravenously, although a few obstinately refuse it. The senile delusional cases may manifest any of the classical forms of paranoia described above, but their delusions are of a rudimentary and unfinished type. The most common of all senile delusions is that they are being robbed. They therefore often hide their small valuables in corners and out-of-the-way places, and as their memories are very defective they are afterwards unable to find them. Others, who live alone, barricade their doors and try to prevent any one entering for fear of thieves. Delusions of ambition in senile subjects are usually of a very improbable and childish character. Hallucinations are generally present in the senile delusional cases.

The *treatment* of senile insanity is from the medical point of view not hopeful; it resolves itself largely into instructions for careful nursing, suitable feeding, and the protection of the patient from all the physical dangers to which he may be exposed.

Statistics.—The statistics of lunacy are merely of interest from a sociological point of view; for under that term are comprised all forms of insanity. It is needless to produce tables illustrative of the relative numbers of lunatics in the various countries of Europe, the systems of registration being so unequal in their working as to afford no trustworthy basis of comparison.

Even in Great Britain, where the systems are more perfect than in any other country, the tables published in the Blue Books of the three countries can only be regarded as approximately correct, the difficulty of registering all cases of lunacy being insuperable. On the 1st of January 1907, according to the returns made to the offices of the Commissioners in Lunacy, the numbers of lunatics stood thus on the registers:—

	Males.	Females.	Totals.
England and Wales	57,176	66,812	123,988
Scotland	8,594	8,999	17,593
Ireland	12,254	11,300	23,554
Gross total	78,024	87,111	165,135

These figures show the ratio of lunatics to 100,000 of the population to be 354 in England and Wales, 312 in Scotland, and 538 in Ireland.

Numbers of Lunatics on the 1st of January of the years 1857–1907 inclusive, according to Returns made to the Offices of the Commissioners in Lunacy for England and Wales, Scotland and Ireland.

Years.	England and Wales.	Scotland.	Ireland.

1903	113,964	16,658	22,138
1904	117,199	16,894	22,794
1905	119,829	17,241	22,996
1906	121,979	17,450	23,365
1907	123,988	17,593	23,554

There is thus an increased ratio in England and Wales of lunatics to the population (which in 1859 was 19,686,701, and in 1907 was estimated at 34,945,600) of 186·8 per 100,000 as against 354·8, and in Scotland of 157 as against 312 per 100,000. The Irish figures on the same basis have increased from 130·9 in 1862 to 538·1 in 1907. The publication of these figures has given rise to the question whether lunacy has actually become more prevalent during the last twenty years, whether there is real increase of the disease. There is a pretty general consent of all authorities that if there has been an increase it is very slight, and that the apparent increase is due, first to the improved systems of registration, and secondly (a far more powerful reason) to the increasing tendency among all classes, and especially among the poorer class, to recognize the less pronounced forms of mental disorder as being of the nature of insanity. Thirdly, the grant of four shillings per week which in 1876 was made by parliament from imperial sources for the maintenance of pauper lunatics has induced parochial authorities to regard as lunatics a large number of weak-minded paupers, and to force them into asylums in order to obtain the benefit of the grant and to relieve the rates. These views receive support from the fact that the increase of private patients, *i.e.* patients who are provided for out of their own funds or those of the family, has advanced in a vastly smaller ratio. In their case the increase, small as it is, can be accounted for by the growing disinclination on the part of the community to tolerate irregularities of conduct due to mental disease. And again, careful inquiry has failed to show a proportional increase of admissions into asylums of such well-marked forms as general paralysis, puerperal mania, &c. The main cause of the registered increase of lunatics is thus to be sought for in the improved registration, and parochial and family convenience. If there is an actual increase, and there is reason for believing that there is a slight actual increase, it is due to the tendency of the population to gravitate towards towns and cities, where the conditions of health are inferior to those of rural life, and where there is therefore a greater disposition to disease of all kinds.

The futility of seeking for accurate figures bearing on the relative number of lunatics in other countries is illustrated by the tables set forth in a report by the United States Census Bureau. They show that the number of registered lunatics in 1903 was 150,151; in 1890, 74,028; and in 1880, 40,942. An attempt was made in 1890 to estimate the number of insane persons outside of hospitals, which was stated to be 32,457. In 1903 no such attempt was made, as it was admitted that so many sources of fallacy existed as to render it useless. Thus the mere statement that of every 100,000 of the population (calculated at 80,000,000) 186·2 were registered as insane is of no value.

II. Legal Aspects

The effect of insanity upon responsibility and civil capacity has been recognized at an early period in every system of law.

Roman Law.—In the Roman jurisprudence its consequences were very fully developed, and the provisions and terminology of that system have largely affected the subsequent legal treatment of the subject. Its leading principles were simple and well marked. The insane person having no intelligent will, and being thus incapable of consent or voluntary action, could acquire no right and incur no responsibility by his own acts (see Sohm's *Inst. Roman Law*, 3rd ed. pp. 216, 217, 219); his person and property were placed after inquiry by the magistrate under the control of a *curator*, who was empowered and bound to manage the property of the lunatic on his behalf (Sohm, p. 513; Hunter, *Roman Law*, pp. 732–735). The different terms by which the insane were known, such as *demens*, *furiosus*, *fatuus*, although no doubt signifying different types of insanity, did not in Roman law infer any difference of legal treatment. They were popular names, which all denoted the complete deprivation of reason.

Medieval Law.—During the middle ages the insane were little protected. Their legal acts were annulled, and their property placed under control, but little or no attempt was made to supervise their personal treatment. In England the wardship of idiots and lunatics, which was annexed before the reign of Edward II. to the king's prerogative, had regard chiefly to the control of their lands and estates, and was only gradually elaborated into the systematic control of their persons and property now exercised under the jurisdiction in lunacy. Those whose means were insignificant were left to the care of their relations or to charity. In criminal law the plea of insanity was unavailing except in extreme cases. About the beginning of the 19th century a very considerable change commenced. The public attention was strongly attracted to the miserable condition of the insane incarcerated in asylums without any efficient check or inspection; and at the same time the medical knowledge of insanity entered on a new phase. The possibility and advantages of a better treatment of insanity were illustrated by eminent physicians, Philippe Pinel in France, H. Tuke in England, Bond, B. Rush and I. Ray in the United States; its physical origin became generally accepted; its mental phenomena were more carefully observed, and its relation was established to other mental conditions.

Modern Law.—From this period we date the commencement of legislation such as that known in England as the Lunacy Acts, which aimed at the regulation and control of all constraint applied to the insane. Hitherto, the criteria of insanity had been very rude, and the evidence was generally of a loose and popular character; but, whenever it was fully recognized that insanity was a disease with which physicians who had studied the subject were peculiarly conversant, expert evidence obtained increased importance, and from this time became prominent in every case. The newer medical views of insanity were thus brought into contact with the old narrow conception of the law courts, and a controversy arose in the field of criminal law which in England, at least, still continues.

Relations between Insanity and Law.—The fact of insanity may operate in law—(1) by excluding responsibility for crime; (2) by invalidating legal acts; (3) by affording ground for depriving the insane person by a legal process of the control of his person and property; or (4) by affording ground for putting him under restraint.

Legal Terminology.—Before proceeding, however, to deal with these matters in succession, it may be desirable to say something with regard to the chief legal terms respecting persons suffering under mental disabilities. The subject is now of less importance than formerly, because the modern tendency of the law is to determine the capacity or responsibility of a person alleged to be insane by considering it with reference to the particular matter or class of matters which brings his mental condition *sub judice*. But the literature of the law of lunacy cannot be clearly understood unless the distinctions between the different terms employed to describe the insane are kept in view. The term *non compos mentis* is as old as the statute *De praerogativa regis* (1325), and is used sometimes, as in that statute, to indicate a species contrasted with idiot, sometimes (*e.g.* in Co. Litt. 246 (*b*)) as a genus, and afterwards, chiefly in statutes relating to the insane, in connexion with the terms "idiot" and "lunatic" as a word *ejusdem generis*. The word "idiot" (Gr. ἴδιος, a private person, one who does not hold any public office, and ἰδιώτης, an ignorant and illiterate person) appears in the statute *De praerogativa regis* as *fatuus naturalis*, and it is placed in contradistinction to *non compos mentis*. The "idiot" is defined by Sir E. Coke (4 *Rep.* 124 (*b*)) as one who from his nativity, by a perpetual infirmity, is *non compos mentis*, and Sir M. Hale (*Pleas of the Crown*, i. 29) describes idiocy as "fatuity *a nativitate vel dementia naturalis*." In early times various artificial criteria of idiocy were suggested. Fitzherbert's test was the capacity of the alleged idiot to count twenty pence, or tell his age, or who were his father and mother (*De natura brevium*, 233). Swinburne proposed as a criterion of capacity, *inter alia*, to measure a yard of cloth or name the days in the week (*Testaments*, 42). Hale propounded the sounder view that "idiocy or not is a question of fact triable by jury and sometimes by inspection" (*Pleas of the Crown*, i. 29). The legal incidents of idiocy were at one time distinct in an important particular from those of lunacy. Under the statute *De praerogativa regis* the king was to have the rents and profits of an idiot's lands to his own use during the life of the idiot, subject merely to an obligation to provide him with necessaries. In the case of the lunatic the king was a trustee, holding his lands and tenements for his benefit and that of his family. It was on account of this difference in the legal consequences of the two states that on inquisitions distinct writs, one *de idiota inquirendo*, the other *de lunatico inquirendo*, were framed for each of them. But juries avoided finding a verdict of idiocy wherever they could, and the writ *de idiota inquirendo* fell into desuetude. A further blow was struck at the distinction when it came to be recognized even by the legislature (see the Idiots Act 1886) that idiots are capable of being educated and trained, and it was practically abolished when the Lunacy Regulation Act 1862, in a provision reproduced in substance in the Lunacy Act 1890, limited the evidence admissible in proof of unsoundness of mind on an inquisition (without special leave of the Master trying the case) to a period of two years before the date of the inquiry, and raised a uniform issue, viz. the state of mind of the alleged lunatic at the time when the inquisition is held.

The term "lunatic," derived from the Latin *luna* in consequence of the notion that the moon had an influence on mental disorders,[1] does not appear in the statute-book till the time of Henry VIII. (1541). Coke defines a lunatic as a "person who has sometimes his understanding and sometimes not, *qui gaudet lucidis intervallis*, and therefore he is called *non compos mentis* so long as he has not understanding" (Co. Litt. 247 (*a*), 4 *Rep.* 124 (*b*)). Hale defines "lunacy" as "interpolated" (*i.e.* intermittent) *dementia accidentalis vel adventitia*, whether total or (a description, it will be observed, of "partial insanity") *quoad hoc vel illud* (*Pleas of the Crown*, i. 29). In modern times, the word "lunacy" has lost its former precise signification. It is employed sometimes in the strict sense, sometimes in contradistinction to "idiocy" or "imbecility"; once at least—viz. in the Lunacy Act 1890—as including "idiot"; and frequently in conjunction with the vague terms "unsound mind" (non-sane memory) and "insane." Section 116 of the Lunacy Act 1890 has by implication extended the meaning of the term lunacy so as to include for certain purposes the incapacity of a person to manage his affairs through mental infirmity arising from disease or age. "Imbecility" is a state of mental weakness "between the limits of absolute idiocy on the one hand and of perfect capacity on the other" (see 1 Haggard, *Eccles. Rep.* p. 401).

1. *The Criminal Responsibility of the Insane.*—The law as to the criminal responsibility of the insane has pursued in England a curious course of development. The views of Coke and Hale give the best exposition of it in the 17th century. Both were agreed that in criminal causes the act and wrong of a madman shall not be imputed to him; both distinguished, although in different language, between *dementia naturalis* (or *a nativitate*) and *dementia accidentalis* or *adventitia*; and the main points in which the writings of Hale mark an advance on those of Coke are in the elaboration by the former of the doctrine of "partial insanity," and his adoption of the level of understanding of a child of fourteen years of age as the test of responsibility in criminal cases (*Pleas of the Crown*, i. 29, 30; and see Co. 4 *Rep.* 124 (*b*)). In the 18th century a test, still more unsatisfactory than this "child of fourteen" theory, with its identification of "healthy immaturity" with "diseased maturity" (Steph. *Hist. Crim. Law*, ii. 150), was prescribed. On the trial of Edward Arnold in 1723 for firing at and wounding Lord Onslow, Mr Justice Tracy told the jury that "a prisoner, in order to be acquitted on the ground of insanity, must be a man that is totally deprived of his understanding and memory, and doth not know what he is doing, no more than an infant, than a brute or wild beast." In the beginning of the 19th century a fresh statement of the test of criminal responsibility in mental disease was attempted. On the trial of Hadfield for shooting at George III. in Drury Lane Theatre on 15th May 1800, Lord Chief Justice Kenyon charged the jury in the following terms: "If a man is in a deranged state of mind at the time, he is not criminally answerable for his acts; but the material part of the case is whether at the very time when the act was committed the man's mind was sane." The practical effect of this ruling, had it been followed, would have been to make the question of the amenability of persons alleged to be insane to the criminal law very much one of fact, to be answered by juries according to the particular circumstances of each case, and without being aided or embarrassed by any rigid external standard. But in 1812, on the trial of Bellingham for the murder of Mr Perceval, the First Lord of the Treasury, Sir James Mansfield propounded yet another criterion of criminal responsibility in mental disease, viz. whether a prisoner has, at the time of committing an offence, a sufficient degree of capacity to distinguish between good and evil. The objection to this doctrine consisted in the fact, to which the writings of Continental and American jurists soon afterwards began to give prominence, that there are very many lunatics whose general ideas on the subject of right and wrong are quite unexceptionable, but who are yet unable, in consequence of delusions, to perceive the wrongness of particular acts. Sir James Mansfield's statement of the law was discredited in the case (4 *State Tri.* (n.s.) 847; 10 Cl. and Fin. 200) of Daniel Macnaughton, who was tried in March 1843, before Chief Justice Tindal, Mr Justice Williams and Mr Justice Coleridge, for the murder of Mr Drummond, the private secretary of Sir Robert Peel. Mr (afterwards Lord Chief Justice) Cockburn, who defended the prisoner, used Hale's doctrine of partial insanity as the foundation of the defence, and secured an acquittal, Chief Justice Tindal telling the jury that the question was whether Macnaughton was capable of distinguishing right from wrong *with respect to the act with which he stood charged*. This judicial approval of the doctrine of partial insanity formed the subject of an animated debate in the House of Lords, and in the end certain questions were put by that House to the judges, and answered by Chief Justice Tindal on behalf of all his colleagues except Mr Justice Maule, who gave

Macnaughton's Case.

[1] The word for "lunatic" in several other languages has a similar etymology. Cp. Ital. *lunatico*, Span. *alunado*, Gr. σεληνιακός (epileptic), Ger. *mondsüchtig*.

independent replies. The answers to those questions are commonly called "The Rules in Macnaughton's case," and they still nominally contain the law of England as to the criminal responsibility of the insane. The points affirmed by the Rules that must be noted here are the propositions that knowledge of the nature and quality of the particular criminal act, at the time of its commission, is the test of criminal responsibility, and that delusion is a valid exculpatory plea, when, and only when, the fancies of the insane person, if they had been facts, would have been so. The Rules in Macnaughton's case are open to serious criticism. They ignore, at least on a literal interpretation, those forms of mental disease which may, for the present purpose, be roughly grouped under the heading "moral insanity," and in which the moral faculties are more obviously deranged than the mental—the affections and the will, rather than the reason, being apparently disordered. The test propounded with reference to delusions has also been strenuously attacked by medical writers, and especially by Dr Maudsley in his work on *Responsibility in Mental Disease*, on the ground that it first assumes a man to have a delusion in regard to a particular subject, and then expects and requires him to reason sanely upon it. It may be pointed out, however, that in thus localizing the range of the immunity which insane delusion confers, the criminal law is merely following the course which, *mutatis mutandis*, the civil law has, with general acceptance, adopted in questions as to the contractual and testamentary capacity of the insane.

The Rules in Macnaughton's case have, as regards moral insanity, undergone considerable modification. Soon after they were laid down, Sir (then Mr) James Fitz-James Stephen, in an article in the *Juridical Papers*, i. 67, on the policy of maintaining the existing law as to the criminal responsibility of the insane, foreshadowed the view which he subsequently propounded in his *History of the Criminal Law*, ii. 163, that no man who was deprived by mental disease of the power of passing a fairly rational judgment on the moral character of an act could be said to "know" its nature and quality within the meaning of the Rules; and it has in recent years been found possible in practice so to manipulate the test of the criminal responsibility which they prescribed as to afford protection to the accused in the by no means infrequent cases of insanity which in its literal interpretation it would leave without excuse.

In Scotland the Rules in Macnaughton's case are recognized, but, as in England, there is a tendency among judges to adopt a generous construction of them. Mental unsoundness insufficient to bar trial, or to exempt from punishment, may still, it is said, be present in a degree which is regarded as reducing the offence from a higher to a lower category,—a doctrine first practically applied in Scotland, it is believed, in 1867 by Lord Deas; and the fact that a prisoner is of weak or ill-regulated mind is often urged with success as a plea in mitigation of punishment. The Indian Penal Code (Act XLV. of 1860, § 84) expressly adopts the English test of criminal responsibility, but the qualifications noted in the case of Scotland have received some measure of judicial acceptance (see Mayne, *Crim. Law Ind.*, 3rd ed., pp. 403-419; Nelson, *Ind. Pen. Code*, 3rd ed., pp. 135 et seq.). The Rules in Macnaughton's case have also been adopted in substance in those colonies which have codified the criminal law. The following typical references may be given: 55 and 56 Vict. (Can.) c. 29, § 11; 57 Vict. (N.Z.), No. 56 of 1893, § 23; No. 101 of 1888 (St Lucia), § 50; No. 5 of 1876 (Gold Coast), § 49 (*b*); No. 2 of 1883, art. 77 (Ceylon); No. 4 of 1871, art. 84 (Straits Settlements). On the other hand, a departure towards a recognition of "moral insanity" is made by the Queensland Criminal Code (No. 9 of 1899), § 27 of which provides that "a person is not criminally responsible for an act" if at the time of doing it "he is in such a state of mental disease . . . as to deprive him . . . of capacity to control his actions": and the law has been defined in the same sense in the Cape of Good Hope in the case of *Queen* v. *Hay* (1899, 16 S.C.R. 290). The Rules were rapidly reproduced in the United States, but the modern trend of American judicial opinion is adverse to them (see Clevenger, *Med. Jur. of Ins.* p. 125; *Parsons* v. *State* (1887) 81 Ala. 577). On the Continent of Europe moral insanity and irresistible impulse are freely recognized as exculpatory pleas (see the French *Code Penal*, § 64; Belgian *Code Penal*, § 71; German *Penal Code*, § 51; Italian *Penal Code*, §§ 46, 47).

Not only is insanity at the time of the commission of an offence a valid exculpatory plea, but supervening insanity stays the action of the criminal law at every stage from arrest up to punishment. High treason was formerly an exception, but the statute making it so (33 Hen. VIII. c. 20) was repealed in the time of Philip and Mary. The Home Secretary has power, under the Criminal Lunatics Act 1884 to order by warrant the removal of a prisoner, certified to be insane, to a lunatic asylum, before [1] trial or after trial, whether under sentence of death or not. Prisoners dealt with under these provisions are styled "Secretary of State's lunatics." On the other hand, a prisoner who on arraignment appears, or is found by the jury to be unfit to plead, or who is found "guilty but insane" at the time of committing the offence—a verdict substituted by the Trial of Lunatics Act 1883 for the old verdict of "acquitted on the ground of insanity," in the hope that the formal conviction recorded in the new finding might have a deterrent effect on the mentally unstable—is committed to a criminal lunatic asylum by the order of the judge trying the case, to be detained there "during the king's pleasure." Lunatics of this class are called "king's pleasure lunatics." There was no doubt at common law as to the power of the courts to order the detention of criminal lunatics in safe custody, but, prior to 1800, the practice was varying and uncertain. On the acquittal of Hadfield, however, in that year for the attempted murder of George III., a question arose as to the provision which was to be made for his detention, and the Criminal Lunatics Act 1800, part of which is still in force, was passed to affirm the law on the subject.

The Criminal Lunatics Act contains provisions similar to those of the Lunacy Act 1890, as to the discharge (conditional or absolute) and transfer of criminal lunatics and the detention of persons becoming pauper lunatics. The expenses of the maintenance of criminal lunatics are defrayed out of moneys provided by Parliament (Crim. Luns. Act 1884, and Hansard, 3rd series, vol. ccxc. p, 75; 139 Com. Jo. pp. 336, 340, 344). The Lunatics' Removal (India) Act 1851 provides for the removal to a criminal lunatic asylum in Great Britain of persons found guilty of crimes and offences in India, and acquitted on the ground of insanity. Similar provisions with regard to colonial criminal lunatics are contained in the Colonial Prisoners' Removal Act 1884; and the policy of this statute has been followed by No 5. of 1894 (New South Wales), and Ordin. No 2 of 1895 (Falkland Islands). Indian law (see Act V. of 1898, §§ 464–475) and the laws of the colonies (the Cape Act No. 1 of 1897 is a typical example) as to the trial of lunatics are similar to the English. In Scotland all the criminal lunatics, except those who may have been removed to the ordinary asylums or have been discharged, are confined in the Criminal Asylum established at Perth in connexion with H.M.'s General Prison, and regulated by special acts (23 & 24 Vict. c. 105, and 40 & 41 Vict. c. 53). Provision similar to the English has been made for prisoners found insane as a bar to trial, or acquitted on the ground of insanity or becoming insane in confinement. In New York, Michigan and other American states there are criminal lunatic asylums. Elsewhere insane criminals are apparently detained in state prisons, &c. The statutory rules as to the maintenance of criminal lunatic asylums, the treatment of the criminal insane, and the plea of insanity in criminal courts in America, closely resemble English practice.

[1] It has sometimes been stated that this power, which ought clearly, in the interests alike of prisoners and of the public, to be exercised with caution, is in fact exerted in an unduly large number of cases. The following figures, taken from the respective volumes of the *Criminal Judicial Statistics*, show the number of criminal lunatics certified insane before trial. In 1884–1885, out of a total of 938 criminal lunatics, 169 were so certified; in 1885–1886, 149 out of 890; in 1889–1890, 108 out of 926; in 1890–1891, 95 out of 900; in 1894, 78 out of 738; in 1895, 84 out of 757; in 1896, 88 out of 769; in 1897, 85 out of 764; in 1898, 17 out of 209; in 1899, 13 out of 159; in 1900, 12 out of 185; in 1901, 15 out of 205; in 1902, 7 out of 233; in 1903, 11 out of 229.

The only special point in Continental law calling for notice is the system by which official experts report for the guidance of the tribunals on questions of alleged criminal irresponsibility (see, *e.g.*, the German *Code of Penal Procedure*, § 293, and cp. § 81).

2. *Insanity and Civil Capacity.*—The law as to the civil capacity of the insane was for some time influenced in Great Britain by the view propounded by Lord Brougham in 1848 in the case of *Waring* v. *Waring*, and by Sir J. P. Wilde in a later case, raising the question of the validity of a marriage, that, as the mind is one and indivisible, the least disorder of its faculties was fatal to civil capacity. In the leading case of *Banks* v. *Goodfellow* in 1870, the court of queen's bench, in an elaborate judgment delivered by Chief Justice Cockburn, disapproved of this doctrine, and in effect laid down the principle that the question of capacity must be considered with strict reference to the act which has to be or has been done. Thus a certain degree of unsoundness of mind is not now, in the absence of undue influence, a bar to the formation of a valid marriage, if the party whose capacity is in question knew at the time of the marriage the nature of the engagement entered into (but see 51 Geo. III. c. 37 as to the marriage of lunatics so found by inquisition). Again, a man whose mind is affected may make a valid will, if he possesses at the time of executing it a memory sufficiently active to recall the nature and extent of his property, the persons who have claims upon his bounty, and a judgment and will sufficiently free from the influence of morbid ideas or external control to determine the relative strength of those claims. So far has this rule been carried, that in 1893 probate was granted of the will of a lady who was a Chancery lunatic at the date of its execution, and died without the inquisition having been superseded. (*Roe* v. *Nix*, 1893, p. 55.) It is also now settled that the simple contract of a lunatic is voidable and not void, and is binding upon him, unless he can show that at the time of making it he was, to the knowledge of the other party, so insane as not to know what he was about. (*Imperial Loan Co.* v. *Stone*, 1892, 1 Q.B. 599.) The test established by *Banks* v. *Goodfellow* is applied also in a number of minor points in which civil capacity comes into question, *e.g.* competency of the insane as witnesses. The law implies, on the part of a lunatic, whether so found or not, an obligation to pay a reasonable price for "necessaries" supplied to him; and the term "necessaries" means goods suitable to his condition in life and to his actual requirements at the time of sale and delivery (Sale of Goods Act 1893).

The question of the liability of an insane person for tort appears still to be undecided (see Pollock on *Torts*, 7th ed. p. 53; Clerk and Lindsell on *Torts*, 2nd ed. pp. 39, 40; *Law Quart. Rev.* vol. xiii. p. 325). Supervening insanity is no bar to proceedings by or against a lunatic husband or wife for divorce or separation for previous matrimonial offences. It does not avoid a marriage nor constitute *per se* a ground either for divorce or for judicial separation. But cruelty does not cease to be a cause of suit if it proceeds from disorderly affections or want of moral control falling short of positive insanity; and possibly even cruelty springing from intermittent or recurrent insanity might be held a ground for judicial separation, since in such case the party offended against cannot obtain protection by securing the permanent confinement of the offending spouse. Whether insanity at the time when an alleged matrimonial offence was committed is a bar to a suit for divorce or separation is an open question; and in any event, in order that it may be so, the insanity must be of such a character as to have prevented the insane party from knowing the nature and consequences of the act at the time of its commission. The laws of Scotland, Ireland, India (see, *e.g.*, Act IX. of 1872, § 12), the colonies and the United States are substantially identical with English law on the subject of the civil capacity of the insane. The German Civil Code (§1569) recognizes the lunacy of a spouse as a ground for divorce, but only where the malady continues during at least three years of the union, and has reached such a pitch that intellectual intercourse between the spouses is impossible, and that every prospect of a restoration of such association is excluded. If one of the spouses obtains a divorce on the ground of the lunacy of the other the former has to allow alimony, just as a husband declared to be the sole guilty party in a divorce suit would have to do (§§ 1585, 1578).

3. *The Jurisdiction in Lunacy.*—In order to effect a change in the status of persons alleged to be of unsound mind, and to bring their persons and property under control, the aid of the jurisdiction in lunacy must be invoked. Under the unrepealed statute *De Praerogativa Regis* (1325) the care and custody of lunatics belong to the Crown. But the Crown has, at least since the 16th century, exercised this branch of the prerogative by delegates, and principally through the Lord Chancellor—not as head of the Court of Chancery, but as the representative and delegate of the sovereign. Under the Lunacy Acts 1890 and 1891, the jurisdiction in lunacy is exercised first by the Lord Chancellor and such of the Lords Justices and other judges as may be invested with it by the sign-manual; and, secondly, by the two Masters in Lunacy, appointed by the Lord Chancellor, from members of the bar of at least ten years' standing, whose duties include the holding of inquisitions and summary inquiries, and the making of most of the consequential orders dealing with the persons and estates of lunatics. County court judges may also exercise a limited jurisdiction in lunacy in the case of lunatics as to whom a reception order has been made, if their entire property is under £200 in value, and no relative or friend is willing to undertake the management of it; in partnership cases where the assets do not exceed £500; and upon application by the guardians of any union for payment of expenses incurred by them in relation to any lunatic.

Persons of unsound mind are brought under the jurisdiction in lunacy either by an inquisition *de lunatico inquirendo*, or, in certain cases which will be adverted to below, by proceedings instituted under §116 of the Lunacy Act 1890, which is now the great practice section in the Lunacy Office. Prior to 1853 a special commission was issued to the Masters in each alleged case of lunacy. But by the Lunacy Regulation Act of that year a general commission was directed to the Masters, empowering them to proceed in each case in which the Lord Chancellor by order required an inquisition to be held. This procedure is still in force. A special commission would now be issued only where both Masters were personally interested in the subject of the inquiry, or for some other similar reason. An inquisition is ordered by the judge in lunacy (a term which does not, for this purpose, at present include the Masters, although this is one of the points in regard to which a change in the law has been suggested, on the petition generally of a near relative of the alleged lunatic. The inquiry is held before one of the Masters, and a jury may be summoned if the alleged lunatic, being within the jurisdiction, demands it, unless the judge is satisfied that he is not competent to form and express such a wish; and even in that case the Master has power to direct trial by jury if he thinks fit on consideration of the evidence. Where the alleged lunatic is not within the jurisdiction the trial must be by jury; and the judge in lunacy may direct this mode of trial to be adopted in any case whatever.

A few points of general interest in connexion with inquisitions must be noted. In practice thirty-four jurors are summoned by the sheriff, and not more than twenty-four are empanelled. Twelve at least must concur in the verdict. Counsel for the petitioner ought to act in the judicial spirit expected from counsel for the prosecution in criminal cases. The issue to be determined on an inquisition is "whether or not the alleged lunatic is at the time of the inquisition of unsound mind, and incapable of managing himself and his affairs" (a special verdict may, however, be found that the lunatic is capable of managing himself, although not his affairs, and that he is not dangerous to others); and without the direction of the person holding the inquisition, no evidence as to the lunatic's conduct at any time being more than two years before the inquisition is to be receivable. This limitation, both of the issue and of the evidence, was imposed with a view to preventing the recurrence of such cases as that of Mr Windham in 1861–1862, when the inquiry ranged over the whole life of an alleged lunatic, forty-eight witnesses being examined on behalf of the petitioners and ninety-one on behalf of the respondents, while the hearing lasted for thirty-four days. For the purpose of assisting the Master or jury in arriving at a decision, provision is made for the personal examination of the alleged lunatic by them on oath or otherwise, and either in open court or in private, as may be directed. The proceedings on inquisition are open to the public. When a person has been found lunatic by inquisition he becomes subject to the jurisdiction in lunacy, and remains so (unless he succeeds in setting aside the verdict by a "traverse"— a proceeding which ultimately comes before, and is determined by, the King's Bench Division in London or at the assizes) until his recovery, when the inquisition may be put an end to by a procedure technically known as "supersedeas," or by his death. The results of the inquisition are worked out in the Lunacy Office. The control of the estate, and, except where he was found incapable of managing his property only, of the person of the lunatic is entrusted to committees of the estate and person, who are appointed by, and accountable to, the Master in Lunacy, and whose legal position corresponds roughly with that of the tutors and curators of the civil law. The committee of the estate in particular exercises over the property of the lunatic, with the sanction or by the order of the Master, very wide powers of management and administration, including the raising of money by sale, charge or otherwise, to pay the lunatic's debts, or provide for his past or future maintenance, charges for permanent improvements, the sale of any property belonging to the lunatic, the execution of powers vested in him and the performance of contracts relating to property.

The alternative method of bringing a person of unsound mind under lunacy jurisdiction was created by § 116 of the Lunacy Act 1890. The effect of that section briefly is to enable the Master, on a summons being taken out in his chambers and heard before him, to apply the powers of management and administration summarized in the last preceding paragraph, without any inquisition, to the following classes of cases: lunatics not so found by inquisition, for the protection or administration of whose property any order was made under earlier acts; every person lawfully detained, within the jurisdiction of the English courts, as a lunatic, though not so found by inquisition; persons not coming within the foregoing categories who are "through mental infirmity arising from disease or age" incapable of managing their affairs; persons of unsound mind whose property does not exceed £2000 in value, or does not yield an annual income of more than £100; and criminal lunatics continuing insane and under confinement.

In Scotland the insane are brought under the jurisdiction in lunacy by alternative methods, similar to the English inquisition and summary procedure, viz. "cognition," the trial taking place before the Lord President of the Court of Session, or any judge of that court to whom he may remit it, and a jury of twelve— see 31 & 32 Vict. c. 100, and Act of Sederunt of 3rd December 1868—and an application to the Junior Lord Ordinary of the Court of Session or (43 & 44 Vict. c. 4, § 4) to the Sheriff Court, when the estate in question does not exceed £100 a year, for the appointment of a *curator bonis* or judicial factor.

The powers of the Lord Chancellor of Ireland with regard to lunatics are generally similar to those of the English Chancellor (see the Lunacy Regulations (Ireland) Act 1871, 34 & 35 Vict. c. 22, and the Lunacy (Ireland) Act 1901, 1 Ed. VII. c. 17; also Colles on *The Lunacy Regulation* (*Ireland*) *Act*).

The main feature of the French system is the provision made by the Civil Code (arts. 489-512) for the interdiction of an insane person by the Tribunal of First Instance, with a right of appeal to the Court of Appeal, after a preliminary inquiry and a report by a family council (arts. 407, 408), consisting of six blood relatives in as near a degree of relationship to the lunatic as possible, or, in default of such relatives, of six relatives by marriage. The family council is presided over by the *Juge de Paix* of the district in which the lunatic is domiciled. This system is also in force in Mauritius.

There are provisions, it may be noted, in Scots law for the interdiction of lunatics, either voluntarily or judicially (see Bell's *Principles*, § 2123). The German Civil Code provides for insane persons being made subject to guardianship (*vormundung*), on conditions similar to those of Scots and French law (see Civil Code, §§ 6, 104 (1896, 1906), 645-679). In the United States the fundamental procedure is an inquisition conducted on practically the same lines as in England. (Cf. Indiana, *Rev. Stats.* (1894) §§ 2715 et seq.; Missouri, Annot. Code (1892) §§ 2835 et seq.; New Mexico, *General Laws* (1880) c. 74 §§ 1 et seq.).

4. *Asylum Administration.*—Asylum administration in England is now regulated by the Lunacy Acts 1890 and 1891. Receptacles for the insane are divisible into the following classes: (i.) Institutions for lunatics, including asylums, registered hospitals and licensed houses. The asylums are provided by counties or boroughs, or by union of counties or boroughs. Registered hospitals are hospitals holding certificates of registration from the Commissioners in Lunacy, where lunatics are received and supported wholly or partially by voluntary contributions or charitable bequests, or by applying the excess of the payments of some patients towards the maintenance of others. Licensed houses are houses licensed by the Commissioners, or, beyond their immediate jurisdiction, by justices; (ii.) Workhouses— see article POOR LAW; (iii.) Houses in which patients are boarded out; (iv.) Private houses (unlicensed) in which not more than a single patient may be received. A person, not being a pauper or a lunatic so found by inquisition, cannot, in ordinary cases, be received and detained as a lunatic in any institution for the insane, except under a "reception order" made by a county court judge or stipendiary magistrate or specially appointed justice of the peace. The order is made on a petition presented by a relative or friend of the alleged lunatic, and supported by two medical certificates, and after a private hearing by the judicial authority. The detention of a lunatic is, however, justifiable at common law, if necessary for his safety or that of others; and the Lunacy Act 1890, borrowing from the lunacy law of Scotland, provides for the reception of a lunatic not a pauper into an asylum, where it is expedient for his welfare or the public safety that he should be confined without delay, upon an "urgency order," made if possible by a near relative and accompanied by one medical certificate. The urgency order only justifies detention for seven days (the curtailment of this period to four days is proposed), and before the expiration of that period the ordinary procedure must be followed. "Summary reception orders" may be made by justices otherwise than on petition. There are four classes of cases in which such orders may be made, viz.: (i.) lunatics (not paupers and not wandering at large) who are not under proper care and control, or are cruelly treated or neglected; (ii.) resident pauper lunatics; (iii.) lunatics, whether pauper or not, wandering at large; (iv.) lunatics in workhouses. (As to pauper lunatics generally, see article POOR LAW.) A lunatic may also be received into an institution under an order by the Commissioners in Lunacy; and a lunatic so found by inquisition under an order signed by the committee of his person.

The chief features of English asylum administration requiring notice are these. Mechanical restraint is to be applied only when necessary for surgical or medical purposes, or in order to prevent the lunatic from injuring himself or others. The privacy of the correspondence of lunatics with the Lord Chancellor, the Commissioners in Lunacy, &c., is secured. Provision is made for regular visits to patients by their relatives and friends. The employment of males for the custody of females is, except on occasions of urgency, prohibited. Pauper lunatics may be boarded out with relatives and friends. Elaborate provision is made for the official visitation of every class of receptacle for the insane. The duties of visitation are divided between the Commissioners in Lunacy, the Chancery Visitors and various other visitors and visiting committees. There are ten Commissioners in Lunacy—four unpaid and six paid, three of the latter being barristers of not less than five years' standing at the date of appointment, and three medical. The Commissioners in Lunacy, who are appointed by the Lord Chancellor, visit every class of lunatics except persons so found by inquisition. These are visited by the Chancery Visitors. There are three Chancery Visitors, two medical and one legal (a barrister of at least five years' standing at the date of his appointment), who are appointed and removable by the Lord Chancellor. The Chancery Visitors (together with the Master in Lunacy) form a Board, and have offices in the Royal Courts of Justice. In addition to these two classes of visitors, every asylum has a Visiting Committee of not less than seven members, appointed by the local authority; and the justices of every county and quarter-sessions borough not within the immediate jurisdiction of the Commissioners in Lunacy annually appoint three or more of their number as visitors of licensed houses.

Provision is made for the discharge of lunatics from asylums, &c., on recovery, or by *habeas corpus*, or by the various visiting authorities. Any person who considers himself to have been unjustly detained is entitled on discharge to obtain, free of expense, from the secretary to the Lunacy Commissioners a copy of the documents under which he was confined.

The Irish [Lunacy Acts 1821–1890; Lunacy (Ireland) Act 1901] and Scottish [Lunacy Acts 1857 (20 & 21 Vict. c. 71), 1887 (50 & 51 Vict. c. 39)] asylum systems present no feature sufficiently different from the English to require separate notice, except that in Scotland "boarding out" is a regular, and not merely an incidental, part of asylum administration. The "boarding out" principle has, however, received its most extended and most successful application in the Gheel colony in Belgium. The patients, after a few days' preliminary observation, are placed in families, and, except that they are under ultimate control by a superior commission, composed of the governor of the province, the Procureur du Roi and others, enjoy complete liberty indoors as well as out of doors. The patients are visited by nurses from the infirmary, to which they may be sent if they become seriously ill or unmanageable. They are encouraged to work. The accommodation provided for them is prescribed, and is to be of the same quality as that of the household in which they live. Clothing is provided by the administration.

In the French (see laws of 30th June 1838 and 18th December 1839) and German (see *Journal of Comparative Legislation*, n.s. vol. i. at pp. 271, 272) asylum systems the main features of English administration are also reproduced.

The lunacy laws of the British colonies have also closely followed English legislation (cf. Ontario, *R.S.* 1897, cc. 317, 318; Manitoba, *R.S.* 1902, c. 80; Victoria (No. 1113, 1890); New Zealand (No. 34 of 1882 and Amending Acts); Mauritius (No. 37 of 1858).

In America the different states of the Union have each their own lunacy legislation. The national government provides only for the insane of the army and navy, and for those residing in the District of Columbia and in Alaska. The various laws as to the reception, &c., of the insane into asylums closely resemble English procedure. But in several states the verdict of a jury finding lunacy is a necessary preliminary to the commitment of private patients (Kentucky, Act of 1883, c. 900, § 14; Maryland, *R.S.* 1878, c. 53, § 21; Illinois, *R.S.* 1874, c. 85, § 22).

Authorities.—The following works may be consulted: Collinson on the *Law of Lunatics and Idiots* (2 vols., London, 1812); Shelford on the *Law of Lunatics and Idiots* (London, 1847). On all points relating to the history and development of the law these two treatises are invaluable. Pope on *Lunacy* (2nd ed., London, 1890); Archbold's *Lunacy* (4th ed., London, 1895); Elmer on *Lunacy* (7th ed., London, 1892); Wood Renton on *Lunacy* (London and Edinburgh, 1896); Fry's *Lunacy Laws* (3rd ed., London, 1890); Pitt-Lewis, Smith and Hawke, *The Insane and the Law* (London, 1895); Hack-Tuke, *Dictionary of Psychological Medicine* (London, 1892), and the bibliographies attached to the various legal articles in that work; Clevenger, *Medical Jurisprudence of Insanity* (2 vols., New York, 1899); Semelaigne, *Les Aliénistes français* (Paris 1849); Bertrand, *Loi sur les aliénés* (Paris, 1872), presents a comparative view of English and foreign legislations. In forensic medicine the works of Taylor, *Medical Jurisprudence* (5th ed., London, 1905); Dixon Mann, *Foreign Medicine and Toxicology* (3rd ed., London, 1902); and Wharton and Stillé, *A Treatise on Medical Jurisprudence* (Philadelphia, 1873); Hamilton and Godkin, *System of Legal Medicine* (New York, 1895); are probably the English authorities in most common use. See also Casper and Liman, *Praktisches Handbuch der gerichtlichen Medicin* (Berlin, 6th ed., 1876); Tardieu, *Étude médico-légale sur la folie* (Paris, 1872); Legrand du Saulle, *La Folie devant les tribunaux* (Paris, 1864); Dubrac, *Traité de jurisprudence médicale* (Paris, 1894); Tourdes, *Traité de médecine légale* (Paris, 1897); and especially Krafft-Ebing, *Lehrbuch der gerichtlichen Psychopathologie* (Stuttgart, 1899). III. Hospital Treatment

The era of real hospitals for the insane began in the 19th century. There had been established here and there in different parts of the world, it is true, certain asylums or places of restraint before the beginning of the 19th century. We find mention in history of such a place established by monks at Jerusalem in the latter part of the 5th century. There is evidence that even earlier than this in Egypt and Greece the insane were treated as individuals suffering from disease. Egyptian priests employed not only music and the beautiful in nature and art as remedial agents in insanity, but recreation and occupation as well. A Greek physician protested against mechanical restraint in the care of the insane, and advocated kindly treatment, the use of music, and of some sorts of manual labour. But these ancient beneficent teachings were lost sight of during succeeding centuries. The prevailing idea of the pathology of insanity in Europe during the middle ages was that of demoniacal possession. The insane were not sick, but possessed of devils, and these devils were only to be exorcised by moral or spiritual agencies. Medieval therapeutics in insanity adapted itself to the etiology indicated. Torture and the cruellest forms of punishment were employed. The insane were regarded with abhorrence, and were frequently cast into chains and dungeons. Milder forms of mental disease were treated by other spiritual means—such as pilgrimages to the shrines of certain saints who were reputed to have particular skill and success in the exorcism of evil spirits. The shrine of St Dymphna at Gheel, in Belgium, was one of these, and seems to have originated in the 7th century, a shrine so famed that lunatics from all over Europe were brought thither for miraculous healing. The little town became a resort for hundreds of insane persons, and as long ago as the 17th century acquired the reputation, which still exists to this day, of a unique colony for the insane. At the present time the village of Gheel and its adjacent farming hamlets (with a population of some 13,000 souls) provides homes, board and care for nearly 2000 insane persons under medical and government supervision. Numerous other shrines and holy wells in various parts of Europe were resorted to by the mentally afflicted—such as Glen-na-Galt in Ireland, the well of St Winifred, St Nun's Pool, St Fillans, &c. At St Nun's the treatment consisted of plunging the patient backwards into the water and dragging him to and fro until mental excitement abated. Not only throughout the middle ages, but far down into the 17th century, demonology and witchcraft were regarded as the chief causes of insanity. And the insane were frequently tortured, scourged, and even burned to death.

Until as late as the middle of the 18th century, mildly insane persons were cared for at shrines, or wandered homeless about the country. Such as were deemed a menace to the community were sent to ordinary prisons or chained in dungeons. Thus large numbers of lunatics accumulated in the prisons, and slowly there grew up a sort of distinction between them and criminals, which at length resulted in a separation of the two classes. In time many of the insane were sent to cloisters and monasteries, especially after these began to be abandoned by their former occupants. Thus "Bedlam" (Bethlehem Royal Hospital) was originally founded in 1247 as a priory for the brethren and sisters of the Order of the Star of Bethlehem. It is not known exactly when lunatics were first received into Bedlam, but some were there in 1403. Bedlam was rebuilt as an asylum for the insane in 1676. In 1815 a committee of the House of Commons, upon investigation, found it in a disgraceful condition, the medical treatment being of the most antiquated sort, and actual inhumanity practised upon the patients. Similarly the Charenton Asylum, just outside Paris, near the park of Vincennes, was an old monastery which had been given over to the insane. Numerous like instances could be cited, but the interesting point to be borne in mind is, that with a general tendency to improvement in the condition of imbeciles upon public charge, idiots and insane persons came gradually to be separated from criminals and other paupers, and to be segregated. The process of segregation was, however, very slow. Even after it had been accomplished in the larger centres of civilization, the condition of these unfortunates in provincial districts remained the same. Furthermore, the transfer to asylums provided especially for them was not followed by any immediate improvement in the patients.

Twenty-five years after Pinel had, in 1792, struck the chains from the lunatics huddled in the Salpêtrière and Bicêtre of Paris, and called upon the world to realize the horrible injustice done to this wretched and suffering class of humanity, a pupil of Pinel, Esquirol, wrote of the insane in France and all Europe: "These unfortunate people are treated worse than criminals, reduced to a condition worse than that of animals. I have seen them naked, covered with rags, and having only straw to protect them against the cold moisture and the hard stones they lie upon; deprived of air, of water to quench thirst, and all the necessaries of life; given up to mere gaolers and left to their surveillance. I have seen them in their narrow and filthy cells, without light and air, fastened with chains in these dens in which one would not keep wild beasts. This I have seen in France, and *the insane are everywhere in Europe treated in the same way.*" It was not until 1838 that the insane in France were all transferred from small houses of detention, workhouses and prisons to asylums specially constructed for this purpose.

In Belgium, in the middle ages, the public executioner was ordered to expel from the towns, by flogging, the poor lunatics who were wandering about the streets. In 1804 the Code Napoleon "punished those who allowed the insane and mad criminals to run about free." In 1841 an investigation showed in Belgium thirty-seven establishments for the insane, only six of which were in good order. In fourteen of them chains and irons were still being used. In Germany, England and America, in 1841, the condition of the insane was practically the same as in Belgium and France.

These facts show that no great advance in the humane and scientific care of the insane was made till towards the middle of the 19th century. Only then did the actual metamorphosis of asylums for detention into hospitals for treatment begin to take place. Hand in hand with this progress there has grown, and still is growing, a tendency to subdivision and specialization of hospitals for this purpose. There are now hospitals for the acutely insane, others for the chronic insane, asylums for the criminal insane, institutions for the feeble-minded and idiots, and colonies for epileptics. There are public institutions for the poor, and well-appointed private retreats and homes for the rich. All these are presided over by the best of medical authorities, supervised by unsalaried boards of trustees or managers, and carefully inspected by Government lunacy commissioners, or boards of charities—a contrast, indeed, to the gaols, shrines, holy wells, chains, tortures, monkish exorcisms, &c., of the past!

The statistics of insanity have been fairly well established. The ratio of insane to normal population is about 1 to 300 among civilized peoples. This proportion varies within narrow limits in different races and countries. It is probable that intemperance in the use of alcohol and drugs, the spread of venereal diseases, and the over-stimulation in many directions induced by modern social conditions, have caused an increase of insanity in the 19th as compared with past centuries. The amount of such increase is probably very small, but on superficial examination might seem to be large, owing to the accumulation of the chronic insane and the constant upbuilding of asylums in new communities. The imperfections of census-taking in the past must also be taken into account.

The modern hospital for the insane does credit to latter-day civilization. Physical restraint is no longer practised. The day of chains—even of wristlets, covered cribs and strait-jackets—is past. Neat dormitories, cosy single rooms, and sitting- and dining-rooms please the eye. In the place of bare walls and floors and curtainless windows, are pictures, plants, rugs, birds, curtains, and in many asylums even the barred windows have been abolished. Some of the wards for milder patients have unlocked doors. Many patients are trusted alone about the grounds and on visits to neighbouring towns. An air of busy occupation is observed in sewing-rooms, schools, shops, in the fields and gardens, employment contributing not only to economy in administration, but to improvement in mental and physical conditions. The general progress of medical science in all directions has been manifested in the department of psychiatry by improved methods of treatment, in the way of sleep-producing and alleviating drugs, dietetics, physical culture, hydrotherapy and the like. There are few asylums now without pathological and clinical laboratories. While it is a far cry from the prisons and monasteries of the past to the modern hospital for the insane, it is still possible to trace a resemblance in many of our older asylums to their ancient prototypes, particularly in those asylums built upon the so-called corridor plan. Though each generation contributed something new, antecedent models were more or less adhered to. Progress in asylum architecture has hence advanced more slowly in countries where monasteries and cloisters abounded than in countries where fixed models did not exist. Architects have had a freer hand in America, Australia and Germany, and even in Great Britain, than in the Catholic countries of Europe.

Germany approaches nearest to an ideal standard of provision for the insane. The highest and best idea which has yet been attained is that of small hospitals for the acutely insane in all cities of more than 50,000 inhabitants, and of colonies for the chronic insane in the rural districts adjacent to centres of population. The psychopathic hospital in the city gives easy and speedy access to persons taken suddenly ill with mental disease, aids in early diagnosis, places the patients within reach of the best specialists in all departments of medicine, and associated, as it should be, with a medical school or university, affords facilities not otherwise available for scientific research and for instruction in an important branch of medical learning. A feature of the psychopathic hospital should be the reception of patients for a reasonable period of time, as sufferers from disease, without the formality of legal commitment papers. Such papers are naturally required for the detention and restraint of the insane for long periods of time, but in the earlier stages they should be spared the stigma, delay and complicated procedure of commitment for at least ten days or two weeks, since in that time many may convalesce or recover, and in this way escape the public record of their infirmities, unavoidable by present judicial procedures.

There should be associated with such hospitals for the acutely insane in cities out-door departments or dispensaries, to which patients may be brought in still earlier stages of mental disorder, at a period when early diagnosis and preventive therapeutics may have their best opportunities to attain good results. In Germany a psychopathic hospital now exists in every university town, under the name of Psychiatrische Klinik.

Colonies for the chronic insane are established in the country, but in the neighbourhood of the cities having psychopathic hospitals, to receive the overflow of the latter when the acute stage has passed. The true colony is constructed on the principle of a farming hamlet, without barracks, corridored buildings, or pavilions. It is similar in most respects to any agricultural community. The question here is one of humane care and economical administration. Humane care includes medical supervision, agreeable home-life, recreation, and, above all things, regular manual and out-of-door occupation in garden, farm and dairy, in the quarry, clay-pit or well-ventilated shop. Employment for the patients is of immense remedial importance, and of great value from the standpoint of economical administration. In the colony system the small cottage homes of the patients are grouped about the centres of industry. The workers in the farmstead live in small families about the farmstead group of buildings; the tillers of the soil adjacent to the fields, meadows and gardens; the brickmakers, quarrymen and artizans in still other cottages in the neighbourhood of the scenes of their activities. In addition to these groups of cottages, which constitute the majority of the buildings in the village, an infirmary for bedridden, excited and crippled patients is required, and a small hospital for the sick. All the inhabitants of the colony are under medical supervision. A laboratory for scientific researches forms a highly important part of the equipment. The colony is not looked upon as a refuge for the incurable; it is still a hospital for the sick, where treatment is carried on under the most humane and most suitable conditions, and wherein the precentage of recoveries will be larger than in asylums and hospitals as now conducted. In respect of the establishment of colonies for the insane upon the plan outlined here, Germany has, as in the case of the psychopathic hospital, led the world. It has been less difficult for that country to set the example, because she had fewer of the conditions of the past to fight, and with her the progress of medical science and of methods of instruction in all departments of medicine has been more pronounced and rapid.

Among the German colonies for the insane, that at Alt-Scherbitz, near Leipzig, is the oldest and most successful, and is pre-eminent in its close approach to the ideal village or colony system. In 1899 Professor Kraeplin of Heidelberg stated (*Psychiatrie*, 6th edition) that the effort was made everywhere in Germany to give the exterior of asylums, by segregation of the patients in separate home-like villas, rather the appearance of hamlets for working-people than prisons for the insane, and he said, further, that the whole question of the care of the insane had found solution in the colony system, the best and cheapest method of support. "I have myself," he writes, "had opportunity to see patients, who had lived for years in a large closed asylum, improve in the most extraordinary manner under the influence of the freer movement and more independent occupation of colony life."

In America the colony scheme has been successfully adopted by the state of New York at the Craig Colony for Epileptics at Sonyea and elsewhere.

That the tendency nowadays, even outside of Germany, in the direction of the ideal standard of provision for the insane is a growing one is manifested in all countries by a gradual disintegration of the former huge cloister-like abodes. More asylums are built on the pavilion plan. Many asylums have, as it were, thrown off detached cottages for the better care of certain patients. Some asylums have even established small agricultural colonies a few miles away from the parent plant, like a vine throwing out feelers. What is called the boarding-out system is an effort in a similar direction. Patients suffering from mild forms of insanity are boarded out in families in the country, either upon public or private charge. Gheel is an example of the boarding-out system practised on a large scale. But the ideal system is that of the psychopathic hospital and the colony for the insane.

Letchworth, *The Insane in Foreign Countries* (New York, 1889); *Care and Treatment of Epileptics* (New York, 1900); F. Peterson, *Mental Diseases* (Philadelphia, 1899); "Annual Address to the American Medico-Psychological Association," *Proceedings* (1899). (F. P.*)

INSCRIPTIONS (from Lat. *inscribere*, to write upon), the general term for writings cut on stone or metal, the subject matter of epigraphy. See generally Writing and Palaeography. Under this heading it is convenient here to deal more specifically with four groups of ancient inscriptions, Semitic, Indian, Greek and Latin, but further information will be found in numerous separate articles on philological subjects. See especially Cuneiform, Babylonia and Assyria, Sumer, Behistun, Egypt (*Language and Writing*), Ethiopia, Phoenicia, Arabia, Hittites, Sabaeans, Minaeans, Etruria, Aegean Civilization, Crete, Cyprus, Britain, Scandinavian Languages, Teutonic Languages, Central America: *Archaeology*, &c.

I. Semitic Inscriptions

Excluding cuneiform (*q.v.*), the inscriptions known as Semitic are usually classed under two main heads as North and South Semitic. The former class includes Hebrew (with Moabite), Phoenician (with Punic and neo-Punic), and Aramaic (with Nabataean and Palmyrene). The South Semitic class includes the Minaean and Sabaean inscriptions of South Arabia. In most of these departments there has been a very large increase of material during recent years, some of which is of the highest historical and palaeographical importance. The North Semitic monuments have received the greater share of attention because of their more general interest in connexion with the history of surrounding countries.

1. *North Semitic.*—The earliest authority for any North Semitic *language* is that of the Tel-el-Amarna tablets (15th century B.C.) which contain certain "Canaanite glosses,"[1] *i.e.* North Semitic words written in cuneiform characters. From these to the first inscription found in the North Semitic *alphabet*, there is an interval of about six centuries. The stele of Mesha, commonly called the Moabite Stone, was set up in the 9th century B.C. to commemorate the success of Moab in shaking off the Israelitish rule. It is of great value, both historically as relating to events indicated in 2 Kings i. 1, iii. 5, &c., and linguistically as exhibiting a language almost identical with Hebrew—that is to say, another form of the same Canaanitish language. It was discovered in 1868 by the German missionary, Klein, on the site of Dibon, intact, but was afterwards broken up by the Arabs. The fragments,[2] collected with great difficulty by Clermont-Ganneau and others, are now in the Louvre. Its genuineness was contested by A. Löwy (*Scottish Review*, 1887; republished, Berlin, 1903) and recently again by G. Jahn (appendix to *Das Buch Daniel*, Leipzig, 1904), but, although there are many difficulties connected with the text, its authenticity is generally admitted.

Early Hebrew inscriptions are at present few and meagre, although it cannot be doubted that others would be found by excavating suitable sites. The most important is that discovered in 1880 in the tunnel of the pool of Siloam, commemorating the piercing of the rock. It is generally believed to refer to Hezekiah's scheme for supplying Jerusalem with water (2 Kings xx. 20), and therefore to date from about 700 B.C. It consists of six lines in good Hebrew, and is the only early Hebrew inscription of any length. The character does not differ from that of the Moabite Stone, except in the slightly cursive tendency of its curved strokes, due no doubt to their having been traced for the stone-cutter by a scribe who was used to writing on parchment. There are also a few inscribed seals dating from before the Exile, some factory marks and an engraved capital at al-Amwās, which last may, however, be Samaritan. Otherwise this character is only found (as the result of an archaizing tendency) on coins of the Hasmoneans, and, still later, on those of the first and second (Bar Kokhba's) revolts.

The new Hebrew character, which developed into the modern square character, is first found in a name of five letters at 'Arāq-al-amīr, of the 2nd century B.C. Somewhat later, but probably of the 1st century B.C., is the tombstone of the B'nē Ḥezīr ("Tomb of St James") at Jerusalem. An inscription on a ruined synagogue at Kafr Bir'im, near Ṣafed, perhaps of about A.D. 300, or earlier, shows the fully developed square character.

Since the publication of the *Corpus Inscr. Sem.* it has been customary to treat papyri along with inscriptions, and for palaeographical reasons it is convenient to do so. Hebrew papyri are few, all in square character and not of great interest. The longest, and probably the earliest (6th century A.D.), is one now in the Bodleian Library at Oxford, containing a private

[1] See Winckler in Schrader's *Keilinschr. Bibl.* v. (Berlin, &c., 1896).

[2] A nearly complete text has been made from these with the help of a squeeze taken before its destruction. See the handbooks mentioned below.

letter[1] written in a character closely resembling that of the Kafr Bir'im inscription. Other fragments were published by Steinschneider[2] (perhaps 8th century), and by D. H. Müller and Kaufmann.[3]

Hebrew inscriptions outside Palestine are the cursive graffiti in the catacombs at Venosa (2nd–5th century), the magical texts on Babylonian bowls (7th–8th century), and the numerous tombstones[4] in various parts of Europe, of all periods from the 6th century to the present time.

The few Samaritan inscriptions in existence are neither early nor interesting.

Closely related to the Hebrews, both politically and in language, were the Phoenicians in North Syria. Their monuments in Phoenicia itself are few and not earlier than the Persian period. The oldest yet found, dating probably from the 5th or 4th century B.C., is that of Yeḥaw-milk, king of Gebal (modern Jebel) or Byblus, where it was found. It records at some length the dedication of buildings, &c., to the goddess of Gebal. Of the 3rd century B.C. are the inscriptions on the sarcophagi of Tabnith and his son Eshmun'azar, kings of Sidon, and some records of other members of the same family, Bod-'ashtart and his son Yathan-milk, found in 1902 a short distance north of Sidon.

Outside Phoenicia the inscriptions are numerous and widely scattered round the Mediterranean coasts, following the course of Phoenician trade. The earliest is that on some fragments of three bronze bowls, dedicated to Baal of Lebanon, found in Cyprus. The character is like that of the Moabite Stone, and the date is probably the 8th century B.C., though some scholars would put it nearer to 1000 B.C. In the latter case, the Hiram, king of Sidon, mentioned in the inscriptions would be the same as Hiram, king of Tyre, in Solomon's time. Similar bowls (of about 700 B.C.) found at Nimrud sometimes bear the maker's name in Phoenician characters.

Many monumental inscriptions have also been found in Cyprus, at Kition, Idalion, Tamassos, &c. They are chiefly votive, some dated in the 4th century, and some being perhaps as late as the 2nd century B.C., so that they afford valuable evidence as to the succession of the local kings. Several also are bilingual, and it was one of these which supplied George Smith with the clue to the Cypriote syllabic system of writing Greek. Similar memorials of Phoenician settlements were found at Athens (Piraeus), in Egypt, Sardinia, Malta and Gozo. Most interesting of all is the celebrated sacrificial tablet of Marseilles, giving an elaborate tariff of payments at or for the various offerings, and showing some striking analogies with the directions in the book of Leviticus. For the information it gives as to civil and priestly organization, it is the most important Phoenician text in existence. It was probably brought from Carthage, where similar tariffs have been found. On the site of that important colony, and indeed throughout the parts of North Africa once subject to its rule, Punic inscriptions are, as might be expected, very numerous. By far the majority are votive tablets, probably belonging to the period between the 4th and the 2nd centuries B.C., many of them in a wonderfully perfect state of preservation. One of the most interesting, recently discovered, mentions a high-priestess who was head of the college of priests, and whose husband's family had been *suffetes* for four generations. Later inscriptions, called neo-Punic, dating from the fall of Carthage to about the 1st century A.D., are written in a debased character and language differing in several respects from the earlier Punic, and presenting many difficulties.

In Aramaic the earliest inscriptions are three found in 1890–1891 at and near Zinjīrlī in North-west Syria, dating from the 8th century B.C. Of these, one was set up by Panammū, king of Ya'dī, in honour of the god Hadad, and is inscribed on a statue of him, the other two were set up by Bar-rekub, son of Panammū, one in honour of his father and on his statue, the second commemorating the erection of his new house. They are remarkable as being engraved in relief, a peculiarity which has been thought to be due to "Hittite" influence. Otherwise the character resembles that of the Moabite Stone. The texts consist of 77 lines (not all legible), giving a good deal of information about an obscure place and period hitherto known only from cuneiform sources. The ornamentation is Assyrian in style, as also is that of the inscriptions of Nerab (near Aleppo), commemorative texts engraved on statues of priests, of about the 7th century.

Of shorter inscriptions there is a long series from about the 8th century B.C., on bronze weights found at Nineveh (generally accompanied by an Assyrian version), and as "dockets"[5] to cuneiform contract-tablets, giving a brief indication of the contents. Aramaic, being the commercial language of the East, was naturally used for this purpose in business documents. For the same reason it is found in the 6th–4th centuries B.C. sporadically in various regions, as in Cilicia, in Lycia[6] (with a Greek version), at Abydos (on a weight). At Taimā also, in North Arabia, an important trading centre, besides shorter texts, a very interesting inscription of twenty-three lines was found, recording the foundation and endowment of a new temple, probably in the 5th century B.C. But by far the most extensive collection of early Aramaic texts comes from Egypt, where the language was used not only for trade purposes, as elsewhere, but also officially under the Persian rule. From Memphis there is a funeral inscription dated in the fourth year of Xerxes (482 B.C.), and a dedication on a bowl of about the same date. A stele recently published by de Vogüé[7] is dated 458 B.C. Another which is now at Carpentras in France (place of origin unknown) is probably not much later. At Elephantine and Assuān in Upper Egypt, a number of ostraka have been dug up, dating from the 5th century B.C. and onward, all difficult to read and explain, but interesting for the popular character of their contents, style and writing. There was a Jewish (or Israelitish[8]) settlement there in the 5th century from which emanated most, if not all, of the papyrus documents edited in the *C.I.S.* Since the appearance of this part of the *Corpus*, more papyri have come to light. One published by Euting[9] is dated 411 B.C. and is of historical interest, eleven others,[10] containing legal documents, mostly dated, were written between 471 and 411 B.C.; another (408 B.C.) is a petition to the governor of Jerusalem.[11] The fragments in the *C.I.S.* are in the same character and clearly belong to the same period. The language continued to be used in Egypt even in Ptolemaic times, as shown by a papyrus[12] (accounts) and ostrakon[13] containing Greek names, and belonging, to judge from the style of the writing, to the 3rd century B.C. The latest fragments[14] are of the 6th–8th century A.D., written in a fully developed square character. They are Jewish private letters, and do not prove anything as to the use of Aramaic in Egypt at that time.

Nabataean inscriptions are very numerous. They are written in a peculiar, somewhat cursive character, derived from the square, and date from the 2nd century B.C. The earliest *dated* is of the year 40 B.C., the latest dated is of A.D. 95. The Nabataean kingdom proper had its centre at Petra (=Sela in 2 Kings xiv. 7), which attained great importance as the emporium on the trade route between Arabia and the Persian Gulf on the

one side and Syria and Egypt on the other. The commercial activity of the people, however, was widely extended, and their monuments are found not only round Petra and in N. Arabia, but as far north as Damascus, and even in Italy, where there was a trading settlement at Puteoli. The inscriptions are mostly votive or sepulchral, and are often dated, but give little historical information except in so far as they fix the dates of Nabataean kings.

A distinct subdivision of Nabataean is found in the Sinaitic peninsula, chiefly in the Wādī Firān and Wādī Mukattib, which lay on the caravan route. The inscriptions are rudely scratched or punched on the rough rock, without any sort of order, and some of them are accompanied by rude drawings. A few only are dated, but, as shown by de Vogüé in the *C.I.S.* (ii. 1, p. 353), they must all belong to the 2nd and 3rd centuries A.D. This accounts for the fact that already in the 6th century Cosmas Indicopleustes [1] has no correct account of their origin, and ascribes them to the Israelites during their wanderings in the wilderness.[2] They were first correctly deciphered as Nabataean by Beer in 1848, when they proved to consist chiefly of proper names (many of them of Arabic formation), accompanied by ejaculations or blessings. It is clear that they are not the work of pilgrims either Jewish or Christian,[3] nor are they of a religious character. The frequent recurrence of certain names shows that only a few generations of a few families are represented, and these must have belonged to a small body of Nabataeans temporarily settled in the particular Wādīs, no doubt for purposes connected with the caravan-traffic. The form of the Nabataean character in which they are written is interesting as being the probable progenitor of the Kufic Arabic alphabet.

Another important trading centre was Tadmor or Palmyra in northern Syria. Numerous inscriptions found there, and hence called Palmyrene, were copied by Waddington in 1861 and published by de Vogüé in his great work *Syrie Centrale* (1868, &c.), which is still the most extensive collection of them. The difficulties of exploration have hitherto prevented any further increase of the material, but much more would undoubtedly be found if excavation were possible. The texts are mostly sepulchral and dedicatory, some of them being accompanied by a Greek version. The language is a form of western Aramaic, and the character, which is derived from the Hebrew and Aramaic square, is closely related to the Syriac estrangelo alphabet. The inscriptions are mostly dated, and belong to the period between 9 B.C. and A.D. 271. The most important is the tariff of taxes on imports, dated A.D. 137. Nearly all were found on the surface at or round Palmyra and remain *in situ.* Of the very few in other places, one (with a Latin version) was found at South Shields, the tombstone of *Regina liberta et conjux* of a native of Palmyra.

Syriac inscriptions are few. The earliest is that on the sarcophagus of Queen Ṣaddan (in the Hebrew version, Ṣadda), perhaps of about A.D. 40, found at Jerusalem. Others were found by Sachau [4] at Edessa, of the 2nd and 3rd centuries, and by Pognon. [5]

2. *South Semitic.*—The South Semitic class of inscriptions comprises the Minaean, Sabaean, Himyaritic and Liḥyanitic in South Arabia, the Thamudic and Safaitic in the north and the Abyssinian. A great deal of material has been collected by Halévy, Glaser and Euting, and much valuable work has been done by them and by D. H. Müller, Hommel and Littmann. Many of the texts, however, are still unpublished and the rest is not very accessible (except so far as it has appeared in the *C.I.S.*), so that South Semitic has been less widely studied than North Semitic.

The successive kingdoms of South Arabia (Yemen) were essentially commercial. Their country was the natural intermediary between Asia (India), Africa and Syria, and this position, combined with its natural fertility, made the south far more prosperous than the north. In language, the two most important peoples, the Minaeans and Sabaeans, differ only dialectically, both writing forms of southern Arabic. The Minaean capital was at Ma'īn, about 300 m. N. of Aden and 200 m. from the west coast. Here and in the neighbourhood numerous inscriptions were found, as well as in the north at al-'Öla.[6] Their chronology is much disputed. D. H. Müller makes the Minaean power contemporary with the Sabaean, but Glaser (with whom Hommel and D. S. Margoliouth agree) contends that the Sabaeans followed the Minaeans, whom they conquered in 820 B.C. Mention is made in a cuneiform text (Annals of Sargon, 715 B.C.) of Ithamar the Sabaean, who must be identical with one (it is not certain which) of the kings of that name mentioned in the Sabaean inscriptions. Their capital was Marib, a little south of Ma'īn, and here they appear to have flourished for about a thousand years. In the 1st century A.D., with the establishment of the Roman power in the north, their trade, and consequently their prosperity, began to decline. The rival kingdom of the Himyarites, with its capital at Zafar, then rose to importance, and this in turn was conquered by the Abyssinians in the 6th century A.D. With the spread of Islām the old Arabic language was supplanted by the northern dialects from which classical Arabic was developed. A peculiarity of the South Arabian inscriptions is that many of them are engraved on bronze tablets. Besides being historically important, they are of great value for the study of early Semitic religion. The gods most often named in Sabaean are 'Athtār Wadd and Nakraḥ, the first being the male counterpart of the Syrian Ashtoreth. The term denoting the priests and priestesses who are devoted to the temple-service is identified by Hommel and others with the Hebrew " Levite."

Closely connected wth South Arabia is Abyssinia. Indeed a considerable number of Sabaean inscriptions have been found at Yeha and Aksum, showing that merchants from Arabia must at some time have formed settlements there. D. H. Müller [7] thinks that some of these belong to the earliest and others to the latest period of Sabaean power. The inscriptions hitherto found in Ethiopic (the alphabet of which is derived from the Sabaean) date from the 4th century A.D. onward. They are few in number, but long and of great historical importance. There can be no doubt that exploration, if it were possible, would bring many more to light.

From time to time emigrants from the southern tribes settled in the north of Arabia. Mention has already been made of Minaean inscriptions found at al-'Öla, which is on the great pilgrim road, about 70 m. south of Taimā. In recent years a number of others has been collected belonging to the people of Liḥyān and dating from about A.D. 250. Nearly related to the Liḥyānitic are the Thamudic (so called from the tribe of the Thamūd mentioned in them), and the Safaitic, both of which, though found in the north, belong in character to south Arabia and no doubt owe their origin to emigrants from the south. The Thamudic inscriptions, collected by Euting (called Proto-Arabian by Halévy),[8] are carelessly scrawled graffiti very like those of the Sinai peninsula. Their date is uncertain, but they cannot be much earlier than the Safaitic, which resemble them in most respects. These last are called after the mountainous district about 20 m. S.E. of Damascus. The inscriptions are, however, found not in Mount Ṣafā itself but in the desert of al-Ḥarrah to the west and south and in the fertile plain of ar-Ruḥbah to the east. They were first deciphered by Halévy,[9] whose work has been carried on and completed by Littmann.[10] Their date is again uncertain, since graffiti of this kind give very few facts from which dates can be deduced. Littmann thinks that one of his inscriptions refers to Trajan's campaign of A.D. 106,

and that they all belong to the first three centuries. They are found together with the earlier Greek and Latin graffiti of Roman soldiers and with later Moslem remarks in Kufic. Many of them are not yet published.

BIBLIOGRAPHY—The best introductions are, for North Semitic, Lidzbarski's *Handbuch d. nordsemitischen Epigraphik* (Weimar, 1898); and G. A. Cooke's *Text-book of North-Semitic Inscriptions* (Oxford, 1903); for South Semitic, Hommel's *Süd-arabische Chrestomathie* (Munich, 1893); Alphabets and facsimiles in Berger, *Histoire de l'écriture*, 2nd ed. (Paris, 1892). The parts of the *Corpus Inscr. Sem.* published up to 1910 are: pars i., tom. i., and tom. ii., fascc. 1-3, 1881–1908 (Phoenician); pars ii., tom. i., 1889–1902 (Aramaic with Nabataean), tom. ii., fasc. i., 1907 (Sinaitic); pars iv., tom i., fascc. 1-4, 1889–1908 (Himyaritic, including Minaean and Sabaean). In all these parts a full bibliography is given. For Palmyrene see de Vogüé's *Syrie Centrale* (Paris, 1868–1877). Works on special departments of the subject have already been mentioned in the notes. (A. Cy.)

II. Indian Inscriptions

The inscriptions of India are extremely numerous, and are found, on stone and other substances, in a great variety of circumstances. They were mostly recorded by incision. But we have a few, referable to the 2nd or 3rd century B.C., which were written with ink on earthenware, and some others, of later times, recorded by paint,—one on a rock, the others on the walls of Buddhist cave-temples. Those, however, were exceptional methods; and equally so was the process of casting, with the result of bringing the letters out in relief, of which we know at present only one instance,—the Sōhgaurā plate, mentioned again below. The Mussulman inscriptions on stone were, it is believed, nearly always carved in relief; and various Hindu inscriptions were done in the same way in the Mussulman period: but only one instance of a stone record prepared in that manner can as yet be cited for the earlier period; it is an inscription on the pedestal of an image of Buddha, of the Gupta period, found in excavations made not long ago at Sārnāth.

Materials on which the inscriptions were recorded.

Amongst the inscriptions on metal there is one that stands out by itself, in respect of the peculiarity of having been incised on iron: it is the short poem, constituting the epitaph of the Gupta king Chandragupta II., which was composed in or about A.D. 415, and was placed on record on the iron column, measuring 23 ft. 8 in. in height, and estimated to weigh more than six tons, which stands at Meharaulī near Delhi. We have a very small number of short Buddhist votive inscriptions on gold and silver, a larger number of records of various kinds on brass, and a larger number still on bronze. The last-mentioned consist chiefly of seals and stamps for making seals. And one of these seal-stamps, belonging to about the commencement of the Christian era, is of particular interest in presenting its legend in Greek characters as well as in the two Indian alphabets which were then in use. For the period, indeed, to which it belongs, there is nothing peculiar in the use of the Greek characters; those characters were freely used on the coins of India and adjacent territories, sometimes along with the native characters, sometimes alone, from about 325 B.C. to the first quarter of the 2nd century A.D.: but this seal-stamp, and the coins of the Kshaharāta king Nahapāna (A.D. 78 to about 125), furnish the only citable good instances of the use of the three alphabets all together. For the most part, however, the known inscriptions on metal were placed on sheets of copper, ranging in size from about $2\frac{1}{2}$ in. by $1\frac{7}{8}$ in. in the case of the Sōhgaurā plate to as much as about 2 ft. 6 in. square in the case of a record of 46 B.C. obtained at Suē-Vihār in the neighbourhood of Bahāwalpūr in the Punjab. Some of these records on copper were commemorative and dedicatory, and were deposited inside the erections—relic-mounds, and, in the case of the Suē-Vihār plate, a tower—to which they belonged. The usual copper record, however, was a donative charter, in fact a title-deed, and passed as soon as it was issued into private personal custody; and many of the known records of this class have come to notice through being produced by the modern possessors of them before official authorities, in the expectation of establishing privileges which (it is hardly necessary to say) have long since ceased to exist through the lapse of time, the dying out of families of original holders, rights of conquest, and the many changes of government that have taken place: but others have been found buried in fields, and hidden in the walls and foundations of buildings. The plates on which these inscriptions were incised vary greatly in the number of the leaves, in the size and shape of them, and in the arrangement of the records on them; partly, of course, according to the lengths of individual records, but also according to particular customs and fashions prevalent in different parts of the country and in different periods of time. In some cases a single plate was used; and it was inscribed sometimes on only one side of it, sometimes on both. More often, however, more plates than one were used, and were connected together by soldered rings; and the number ranges up to as many as thirty-one in the case of a charter issued by the Chōḷa king Rājēndra Chōḷa I. in the period A.D. 1011 to 1037. It was customary that such of the records on copper as were donative charters should be authenticated. This was sometimes done by incising on the plates what purports to be more or less an autograph signature of the king or prince from whom a charter emanated. More usually, however, it was effected by attaching a copper or bronze reproduction of the royal seal to the ring or to one of the rings on which the plates were strung; and this practice has given us another large and highly interesting series of Indian seals, some of them of an extremely elaborate nature. In this class of records we have a real curiosity in a charter issued in A.D. 1272 by Rāmachandra, one of the Yādava kings of Dēvagiri: this record is on three plates, each measuring about 1 ft. 3 in. in width by 1 ft. $8\frac{1}{2}$ in. in height, which are so massive as to weigh 59 ℔. 2 oz.; and the weight of the ring on which they were strung, and of an image of Garuḍa which was secured to it by another ring, is 11 ℔. 12 oz.: thus, the total weight of this title-deed, which conveyed a village to fifty-seven Brāhmaṇs, is no less than 70 ℔. 14 oz.; appreciably more than half a hundredweight.

Amongst substances other than metal we can cite only one instance in which crystal was used; this material was evidently found too hard for any general use in the inscriptional line: the solitary instance is the case of a short record found in the remains of a Buddhist stūpa or relic-mound at Bhaṭṭiprōlu in the Kistna district, Madras. In various parts of India there are found in large numbers small tablets of clay prepared from stamps, sometimes baked into terra-cotta, sometimes left to harden naturally. Objects of this class were largely used as votive tablets, especially by the Buddhists; and their tablets usually present the so-called Buddhist formula or creed: "Of those conditions which spring from a cause, Tathāgata (Buddha) has declared the cause and the suppression of them; it is of such matters that he, the great ascetic, discourses": but others, from Sunet in the Ludhiāna district, Punjab, show by the legends on them that the Śaivas and Vaishṇavas also habitually made pious offerings of this kind on occasions of visiting sacred places. Recent explorations, however, in the Gōrakhpūr and Muzaffarpūr districts have resulted in the discovery, in this class of records, of great numbers of clay seals bearing various inscriptions, which had been attached to documents sent to and fro between administrative offices, both royal and municipal, between religious establishments, and between private individuals: and amongst these we have seals of the monastery at Kusinārā, one of the places at which the eight original portions of the corporeal relics of Buddha were enshrined in relic-mounds, and also a seal-stamp used for making seals of the monastery at Veṭhadīpa, another of those places. And from Kāṭhiawār we have a similar seal-stamp which describes itself as the property "of the prince and commander-in-chief Pushyēṇa, son of the illustrious prince Ahivarman, whose royal pedigree extends back unbroken to Jayadratha." There are no indications that the use of brick for inscriptional purposes was ever at all general in India, as it was in some other eastern lands: but there have been found in the Ghāzīpūr district numerous bricks bearing the inscription "the glorious Kumāragupta," with reference to either the first or the second Gupta king of that name, of the 5th century A.D.; in the Gōrakhpūr district there have been found brick tablets bearing Buddhist texts, one of which is a version in Sanskṛit of a short sermon preached by Buddha; and from the Jaunpūr district we have a brick tablet bearing an inscription which registers a mortgage, made in A.D. 1217, of some lands a security for a loan. Inscribed earthenware relic-receptacles have been found in the Bhōpāl state: donative earthenware jars, bearing inscriptions, have been obtained near Chārsadda in the North-West Frontier province: and from Kāṭhiāwār we have a piece of earthenware, apparently a fragment of a huge pot, bearing an inscription which presents a date in A.D. 566–67 and the name of "the glorious Guhasēna," one of the Maitraka princes of Valabhī. For the great bulk of the inscriptions, however, stone was used: but limitation of space prevents us from entering into any details here, and only permits us to say that in this class the records are found all over India on rocks, on isolated monolith columns and pillars, of which some were erected simply to bear the records that were published on them, others were placed in front of temples as flagstaffs of the gods, and others were set up as pillars of victory in battle; on relic-receptacles hidden away in the interiors of Buddhist stūpas; on external structural parts of stūpas; on façades, walls, and other parts of caves; on pedestals and other parts of images and statues, sometimes of colossal size; on moulds for making seals; on walls, beams, pillars, pilasters, and other parts of temples; and on specially prepared slabs and tablets, sometimes built into the walls of temples and other erections, sometimes set up inside temples or in the courtyards of them, or in conspicuous places in village-sites and fields, where they have occasionally in the course of time become buried.

Reasons why the inscriptions are so valuable.

The inscriptional records of India which have thus come down to us do not, as far as they are known at present, pretend to the antiquity of the Greek inscriptions of the Hellenic world; much less to that of the inscriptions of Egypt and Assyria. But they are no less important; since we are dependent on them for almost all our knowledge of the ancient history of the country.

The primary reason for this is that the ancient Hindus, though by no means altogether destitute of the historical instinct, were not writers of historical books. In some of the *Purāṇas*, indeed, they have given us chapters which purport to present the succession of their kings from the commencement of the present age, the Kaliyuga, in 3102 B.C.: but the chronological details of those chapters disclose the fault of treating contemporaneous dynasties, belonging to different parts of India, as successive dynasties ruling over one and the same territory; with the result that they would place more than three centuries in the future from the present time the great Gupta kings who reigned in Northern India from A.D. 320 to about 530. They have given us, for Kashmīr the *Rājataraṁgiṇī*, the first eight cantos of which, written by Kalhaṇa in A.D. 1148–49, purport to present the general history of that country, with occasional items relating to India itself, from 2448 B.C., and to give the exact length, even to months and days, of the reign of each king of Kashmīr from 1182 B.C.: but, while we may accept Kalhaṇa as fairly correct for his own time and for the preceding century or so, an examination of the details of his work quickly exposes its imaginative character and its unreliability for any earlier period: notably, he places towards the close of the period 2448 to 1182 B.C. the great Maurya king Aśōka, whose real initial date was 264 B.C.; and he was obliged to allot to one king, Raṇāditya I., a reign of three centuries (A.D. 222 to 522, as placed by him) simply in order to save his own chronology. They have given us historical romances, such as the *Harshacharita* of Bāṇa, written in the 7th century, the *Vikramāṅkadēvacharita* of Bilhaṇa, written about the beginning of the 12th century, and the Tamil poems, the *Kaḷavaḷi*, the *Kaliṅgattu-Paraṇi*, and the *Vikrama-Chōḷan-Uḷā*, the first of which may be of somewhat earlier date than Bāṇa's work, while the second and third are of much the same time with Bilhaṇa's: but, while these present some charming reading in the poetical line, with much of interest, and certainly a fair amount of important matter, they give us no dates, and so no means without extraneous help of applying the information that is deducible from them. Again, they have given us, especially in Southern India, a certain amount of historical details in the introductions and colophons of their literary works; and here they have often furnished dates which give a practical shape to their statements: but we quickly find that the historical matter is introduced quite incidentally, to magnify the importance of the authors themselves rather than to teach us anything about their patrons, and is not handled with any particular care and fulness; and it would be but a sketchy and imperfect history, and one relating to only a limited and comparatively late period, that we could piece together even from these more precise sources. The ancient Hindus, in short, have not bequeathed to us anything that can in any way compare with the historical writings of their Greek and Roman contemporaries. They have not even given us anything like the *Dīpavaṁsa* of Ceylon, which, while it contains a certain amount of fabulous matter, can be recognized as presenting a real and reliable historical account of that island, taken from records written up during the progress to the events themselves, from at any rate the time of Aśōka to about A.D. 350; or like the *Mahāvaṁsa*, which, commenting on and amplifying the details of the *Dīpavaṁsa*, takes up a similar account from the end of the period covered by that work. Even the Greek notices of India, commencing with the accounts of the Asiatic campaign of Alexander the Great, have told us more about its political history and geography during the earlier times than have the Hindus themselves: and in fact, in mentioning Sandrokottos, *i.e.* Chandragupta, the grandfather of Aśōka, and in furnishing details which fix his initial date closely about 320 B.C., the Greeks gave us the first means of making a start towards arranging the chronology of India on accurate lines. It is in these circumstances, in the absence of any indigenous historical writings of a plain, straightforward, and authentic nature, that the inscriptions of India are of such great value. They are supplemented—and to an important extent for at any rate the period from the end of Aśōka's reign in 227 B.C. to the commencement of the reign of Kaṇishka in 58 B.C., and again from about a century later to the rise of the Gupta dynasty in A.D. 320 —by the numismatic remains. But the coins of India present no dates until nearly the end of the 2nd century A.D.; the case of Parthia, which has yielded dated coins from only 38 B.C., illustrates well the difficulty of arranging undated coins in chronological order even when the assistance of historical books is available; and what we may deduce from the coins of India is still to be put into a final shape in accordance with what we can determine from the inscriptions. In short, the inscriptions of India are the only sure grounds of historical results in every line of research connected with its ancient past; they regulate everything that we can learn from coins, architecture, art, literature, tradition, or any other source.

That is one reason why the inscriptions of India are so valuable; they fill the void caused by the absence of historical books. Another reason is found in the great number of them and the wide area that is covered by them. They come from all parts of the country: from Shāhbāzgarhī in the north, in the Yūsufzai subdivision of the Peshāwar district, to the ancient Pāṇḍya territory in the extreme south of the peninsula; and from Assam in the east to Kāṭhiāwār in the west. For the time anterior to about A.D. 400, we already have available in published form, more or less complete, the contents of between 1100 and 1200 records, large and small; and the explorations of the Archaeological Department are constantly bringing to light, particularly from underground sites, more materials for that period. For the time onwards from that point, we have similarly available the contents of some 10,000 or 11,000 records of Southern India, and of at any rate between 700 and 800 records of Northern India where racial antagonism came more into play and worked more destruction of Hindu remains than in the south.

Another reason is found in the fact that from the first century B.C. the inscriptions are for the most part specifically dated: some in various eras the nature and application of which are now thoroughly well understood, often with also a mention of the year of the twelve-years or of the sixty-years cycle of the planet Jupiter; others in the regnal years of kings whose periods are now well fixed. And, in addition to usually stating the month and the day along with the year, the inscriptions sometimes give, under the influence of Hindu astrology, other details so exact that we can determine, even to the actual hour, the occurrence of the event registered by a particular record.

A final reason is found in the precise nature of the inscriptions. A certain proportion of them consists of plain statements of events,—recitals of the pedigrees and achievements of kings, records of the carrying out of public works, epitaphs of kings, heroes, and saints, compacts of political alliance, and so on; and some of these present, in fact, short historical compositions which illustrate well what the ancient Hindus might have done if they had felt any special call to write plain and veracious chronicles on matter-of-fact lines. But we are indebted for the great bulk of the inscriptions, not to any historical instinct, but to the religious side of the Hindu character, and to the constant desire of the Hindus to make donations on every possible occasion. The inscriptions devoted simply to the propagation of morality and religion are not very numerous: the most notable ones in this class are the edicts of Aśōka, which we shall notice again farther on. The general object of the inscriptions was to register gifts and endowments, made sometimes to private individuals, but more usually to gods, to priests on behalf of temples and charitable institutions, and to religious communities. And, as the result of this, in the vast majority of the inscriptional remains we have a mass of title-deeds of real property, and of certificates of the right to duties, taxes, fees, perquisites, and other privileges. Now, the essential part of the records was of course the specification of the details of the donor, of the donee, and of the donation. And we have to bear in mind that not only are the donative records by far the most abundant of all, but also, among them, by far the most numerous are those which we may call the records of royal donations; by which we mean grants that were made either by the kings themselves, or by the great feudatory nobles, or by provincial governors and other high officials who had the royal authority to alienate state lands and to assign allotments from the state revenues: also, that many of them register, not simply the gift of small holdings, but grants of entire villages, and large and permanent assignments from the public revenues. It is to these facts that we are indebted for the great value of the records from the historical point of view. The donor of state lands or of an assignment from the public revenues must show his authority for his acts. A provincial governor or other high official must specify his own rank and territorial jurisdiction, and name the king under whom he holds office. A great feudatory noble will often give a similar reference to his paramount sovereign, in addition to making his own position clear. And it is neither inconsistent with the dignity of a king, nor unusual, for something to be stated about his pedigree in charters and patents issued by him or in his name. The records give from very early times a certain amount of genealogical information. More and more information of that kind was added as time went on. The recital of events was introduced, to magnify the glory and importance of the donors, and sometimes to commemorate the achievements of recipients. And it was thus, not with the express object of recording history, but in order to intensify the importance of everything connected with religion and to secure grantees in the possession of properties conveyed to them, that there was gradually accumulated almost the whole of the great mass of inscriptional records upon which we are so dependent for our knowledge of the ancient history of India in all its branches.

Survey of the inscriptions.

Coming now to a survey of the inscriptions themselves, we must premise that India is divided, from the historical point of view, though not so markedly in some other respects, into two well-defined parts, Northern and Southern. A classical name of Northern India is Āryāvarta, "the abode of the Āryas, the excellent or noble people," Another name, which figures both in literature and in the inscriptions, is Uttarāpatha, "the path of the north, the northern road." And, as a classical name of Southern India answering to that we have Dakshiṇāpatha, "the path of the south, the southern road," from the first component of which name comes our modern term Deccan, Dekkan, or Dekhaṇ. Sanskṛit literature names as the dividing-line between Āryāvarta or the Uttarāpatha and the Dakshiṇāpatha, *i.e.* between Northern and Southern India, sometimes the Vindhya mountains, sometimes the river Nerbudda (Narmadā, Narbadā) which, flowing close along the south of the Vindhya range, empties itself into the gulf of Cambay near Broach, in Gujarāt, Bombay. The river seems, on the whole, to furnish the better dividing-line of the two. But it does not reach, any more than the range exactly extends, right across India from sea to sea. And, to complete the dividing-line beyond the sources of the Narbadā, which are in the Māikal range and close to the Amarkaṇṭak hill in the Rēwā State, Baghēlkhaṇḍ, we have to follow some such course as first the Maniārī river, from its sources, which are in that same neighbourhood but on the south of the Māikal range, to the point where, after it has joined the Seonāth, the united rivers flow into the Mahānadī, near Seorī-Nārāyan in the Bilāspūr district, Central Provinces, and then the Mahānadī itself, which flows into the bay of Bengal near Cuttack in Orissa. Even so, however, we have only a somewhat rough dividing-line between the historical Northern and Southern India; and the distinction must not be understood too strictly in connexion with the territories lying close on the north and the south of the line sketched above. In Western India, Kāṭhiāwār and all the portions of Gujarāt above Broach lie to the north of the Narbadā; but from the palaeographic point of view, if not so much from the historical, they belong essentially to Southern India. Our modern Central India lies entirely in Northern India, but has various palaeographic connexions with Southern India. Our Central Provinces extend in the Saugar district into Northern India; and that portion of them presents in ancient times both northern and southern characteristics. Eastern India may be defined as consisting of Bengal, with Orissa and Assam: it belongs to Northern India.

The inscriptional remains of India, as known at present, practically begin with the records of Aśōka, the great Maurya king of Northern India,—grandson of that king Chandragupta whose name was written by the Greeks as Sandrokottos,—who reigned 264 to 227 B.C. The state of the alphabets, indeed, in the time of Aśōka renders it certain that the art of writing must have been practised in India for a long while before his period; and it gives us every reason to hope that systematic exploration, especially of buried sites, will eventually result in the discovery of records framed by some of his predecessors or by their subjects. But those discoveries have still to be made; and matters stand just now as follows. From before the time of Aśōka we have an inscription on a relic-vase from a stūpa or relic-mound at Piprahwa in the north-east corner of the Bastī district, United Provinces, which preserves the memory of the slaughtered kinsmen of Buddha, the Śākyas of Kapilavastu according to the subsequent traditional nomenclature. We may perhaps place before his time the record on the Sōhgaurā plate, from the Gōrakhpūr district, United Provinces, which notifies the establishment of two public storehouses at a junction of three great highways of vehicular traffic to meet any emergent needs of persons using these roads. And we may possibly decide hereafter to refer to the same period a few other records which are not at present regarded as being quite so early. But, practically, the known inscriptions of India begin with the records of that king who calls himself in them "the king Dēvānaṁpiya-Piyadassi, the Beloved of the Gods, He of Gracious Mien," but who is best known as Aśōka by the name given to him in the literature of India and Ceylon and in an inscription of A.D. 150 at Junāgaḍh (Junagarh) in Kāṭhiāwār. From his time onwards we have records from all parts in constantly increasing numbers, particularly during the earlier periods, from caves, rock-cut temples, and Buddhist stūpas. Many of them, however, are of only a dedicatory nature, and, valuable as they are for purposes of religion, geography, and other miscellaneous lines of research, are not very helpful in the historical line. We are interested here chiefly in the historical records; and we can notice only the most prominent ones even among them.

Of this king Aśōka we have now thirty-five different records, some of them in various recensions. Amongst them, the most famous ones are the seven pillar-edicts and the fourteen rock-edicts, found in various versions, and in a more or less complete state, at different places from Shāhbāzgarhī in the Yūsufzai country in the extreme north-west, to Radhia, Mathia, and Rāmpūrwa in the Champāran district, Bengal, at Dhauli in the Cuttack district of Orissa, at Jaugada in the Gañjām district, Madras, at Girnār (Junāgaḍh) in Kāṭhiāwār, and even at Sopāra in the Ṭhāṇa district, Bombay. These edicts were thus published in conspicuous positions in or near towns, or close to highways frequented by travellers and traders, or in the neighbourhood of sacred places visited by pilgrims, so that they might be freely seen and perused. And the object of them was to proclaim the firm determination of Aśōka to govern his realm righteously and kindly in accordance with the duty of pious kings, and with considerateness for even religious beliefs other than the Brāhmaṇical faith which he himself at first professed, and to acquaint his subjects with certain measures that he had taken to that end, and to explain to them how they might co-operate with him in his objects. But, in addition to mentioning certain contemporaneous foreign kings, Antiochus II. (Theos) of Syria, Ptolemy Philadelphus of Egypt, Antigonus Gonatas of Macedonia, Magas of Cyrene, and Alexander II. of Epirus, they yield items of internal history, in detailing some of Aśōka's administrative arrangements; in locating the capital of his empire at Pāṭaliputra (Patna), and seats of viceroys at Ujjēni (Ujjain) and Takhasilā (Taxila); in giving the names of some of the leading peoples of India, particularly the Chōḷas, the Pāṇḍyas, and the Andhras; and in recording the memorable conquest of the Kaliṅga country, the attendant miseries of which first directed the thoughts of the king to religion and to solicitude for the welfare of all his subjects. Another noteworthy record of Aśōka is that notification, containing his Last Edict, his dying speech, issued by local officials just after his death, which is extant in various recensions at Sahasrām, Rūpnāth, and Bairāt in Northern India, and at Brahmagiri, Siddāpura, and Jaṭinga-Rāmēśvara in Mysore. Some three years before the end of his long reign of thirty-seven years, Aśōka became a convert to Buddhism, and was admitted as an Upāsaka or lay-worshipper. Eventually, he formally joined the Buddhist order; and, following a not infrequent custom of ancient Indian kings, he abdicated, took the vows of a monk, and withdrew to spend his remaining days in religious retirement in a cave-dwelling on Suvarnagiri (Sōngīr), one of the hills surrounding the ancient city of Girivraja, belowRājagṛiha (Rājgīr), in the Patna district in Behār. And there, about a year later, in his last moments, he delivered the address incorporated in this notification, proclaiming as the only true religion that which had been promulgated by Buddha, and expanding the topic of the last words of that great teacher: "Work out your salvation by diligence!" This record, it may be added, is also of interest because, whereas such of the other known records of Aśōka as are dated at all are dated according to the number of years elapsed after his anointment to the sovereignty, it is dated 256 years after the death of Buddha, which event took place in 483 B.C.

For the two centuries or nearly so next after the end of the reign of Aśōka, we have chiefly a large number of short inscriptions which are of much value in miscellaneous lines of research—palaeography, geography, religion, and so on. But historical records are by no means wanting; and we may mention in particular the following. From the caves in the Nāgārjunī Hills in the Gayā district, Bengal, we have (along with three of the inscriptions of Aśōka himself) three records of a king Daśaratha who, according to the *Vishṇu-Purāna*, was a grandson of Aśōka. From the stūpa at Bharaut in the Nāgōd state, Central India, we have a record which proves the existence of the dynasty of the Śuṅga kings, for whom the *Purānas*, placing them next after the line of Chandragupta and Aśōka, indicate the period 183 to 71 B.C. Two of the records from the stūpa at Bhaṭṭiprōlu in the Kistna district, Madras, give us a king of those parts, reigning about 200 B.C., whose name appears both as Kubiraka and as Khubiraka. From Bēsnagar in the Gwālior state we have an inscription, referable to the period 175 to 135 B.C., which mentions a king of Central India, by name Bhāgabhadra, and also mentions, as his contemporary, one of the Greek kings of the Punjab, Antalkidas, whose name is familiar from his coins in the form Antialkidas. From the Hāthigumphā cave near Cuttack, in Orissa, we have a record, to be placed about 140 B.C., of king Khāravēla, a member of a dynasty which reigned in that part of India. From a cave at Pabhōsā in the Allahābād district, United Provinces, we have two records which make known to us a short succession of kings of Adhichatrā, otherwise known as Ahichchhattra. From a cave at the Nānāghāt Pass in the Poona district, Bombay, we have a record of queen Nāyanikā, wife of one of the great Sātavāhana-Sātakarṇi kings of the Deccan. And from the stūpa No. 1 at Sāñchi in the Bhōpāl state, Central India, we have a record of a king Śrī-Sātakarṇi, belonging to perhaps another branch of the same great stock.

The historical records become more numerous from the time of the Kushan king Kaṇishka or Kāṇishka, who began to reign in 58 B.C., and founded the so-called Vikrama era, the great historical era of Northern India, beginning in that year.[1] For the period of him and his immediate successors, Vāsishka, Huvishka and Vāsudēva, we have now between seventy and eighty inscriptions, ranging from 54 B.C. to A.D. 42, and disclosing a sway which reached at its height from Bengal to Kābul: we are indebted for some of these to the Buddhists, in connexion with whose faith the memory of Kaṇishka was preserved by tradition, but for most of them to the Jains, who seem to have been at that time the more numerous sect in the central part of his dominions.

The dynasty of Kaṇishka was succeeded by another foreign ruler, Gondophernēs, popularly known as Gondophares, whose coins indicate that, in addition to a large part of north-western India and Sind, his dominions included Kābul, Kandahār, and Sēistān. This king is well known to Christian tradition, in connexion with the mission of St Thomas the Apostle to the East. And the tradition is substantially supported by an inscription from Takht-i-Bahaī in the Yūsufzai country on the north-west frontier, which, like some of his coins, mentions him as Guduphara or Gunduphara, and proves that he was reigning there in A.D. 47.

Gondophernēs was followed by the Kadphisēs kings, belonging to another branch of the Kushan tribe, who perhaps extended their sway farther into India, as far at least as Mathurā (Muttra), and reigned for about three-quarters of a century. For their period, and in fact for the whole time to the rise of the Guptas in A.D. 320 we have as yet but scanty help from the inscriptions in respect of the political history of Northern India: we are mostly dependent on the coins, which tend to indicate that that part of India was then broken up into a number of small sovereignties and tribal governments. An inscription, however, from Panjtar in the Yūsufzai territory mentions, without giving his name, a Kushan king whose dominion included that territory in A.D. 66. And an inscription of A.D. 242 from Mathurā has been understood to indicate that some descendant of the same stock was then reigning there. The inscriptional records for that period belong chiefly to Southern India.

Meanwhile, however, in the south-west corner of Northern India, namely in Kāṭhiāwār, there arose another foreign king, apparently of Parthian extraction, by name Nahapāna, described in his records, whether by a family name or by a tribal appellation, as a Chhaharāta or Kshaharāta, in whom we have the

[1] It may be remarked that there are about twelve different views regarding the date of Kaṇishka and the origin of the Vikrama era. Some writers hold that Kaṇishka began to reign in A.D. 78: one writer would place his initial date about A.D. 123: others would place it in A.D. 278. The view maintained by the present writer was held at one time by Sir A. Cunningham; and, as some others have already begun to recognize, evidence is now steadily accumulating in support of the correctness of it.

founder of the so-called Śaka era, the principal era of Southern India, beginning in A.D. 78: in respect of him we learn from the *Periplus of the Erythraean Sea* that he was reigning between A.D. 80 and 89, and from inscriptions that he was still reigning in A.D. 120 and 124: at the latter time, his dominions included Nāsik and other territories on the south of the Narbadā; and the *Periplus* names as his capital a town which it calls Minnagar, and which Ptolemy would locate in such a manner as to suggest that it may be identified with the modern Dōhad in the Pañch Mahāls district of Gujarāt, Bombay. Nahapāna was overthrown, and his family was entirely wiped out, soon after A.D. 125, by the great Sātāvahana king Gautamīputra-Śrī-Sātakarṇi, who thereby recovered the territories on the south of the Narbadā. On the north of that river, however, he was followed by a line of kings founded by his viceroy Chashṭana, son of Ghsamotika, to whom Ptolemy, mentioning him as Tiastanēs, assigns Ujjain as his capital: these names, again, show a foreign origin; but, from the time of his son Jayadāman, the descendants of Chashṭana became Hinduized, and mostly bore purely Indian appellations. The coins show that the descendants of Chashṭana ruled till about A.D. 388, when they were overthrown by the great Gupta dynasty of Northern India. Only a few of their inscriptional records have been discovered: but amongst them a very noteworthy one is the Junāgaḍh (Junagarh) inscription of Chashṭana's grandson, Rudradāman, bearing a date in A.D. 150; it is remarkable as being the earliest known long inscription written entirely in Sanskṛit.

From Southern India we have, at Nāsik, inscriptions of the Sātavāhana king Gautamīputra-Śrī-Sātakarṇi, mentioned just above, and of his son Vāsisṭhīputra-Śrī-Puḷumāyi, and of another king of that line named Gautamīputra-Śrī-Yajña-Sātakarṇi; and other records of the last-mentioned king come from Kaṇheri near Bombay, and from the Kistna district, Madras, and testify to the wide extent of the dominions of the line to which he belonged. The records of this king carry us on to the opening years of the 3rd century, soon after which time, in those parts at any rate, the power of the Sātavāhana kings came to an end. And we have next, also from Nāsik, an inscription of an Ābhīra king named Īśvarasēna, son of Śivadatta; in this last-mentioned person we probably have the founder of the so-called Kalachuri or Chēdi era, beginning in A.D. 248 or 249, which we trace in Western India for some centuries before the time when it was transferred to, or revived in, Central India, and was invested with its later appellation: we trace it notably in the records of a line of kings who called themselves Traikūṭakas, apparently from Trikūṭa as the ancient name of the great mountain Harischandragaḍ in the Western Ghauts, in the Ahmadnagar district.

We can, of course, mention in this account only the most prominent of the inscriptional records. Keeping for the present to Southern India, we have from Banawāsi in the North Kanara district, Bombay, and from Maḷavaḷḷi in the Shimoga district, Mysore, two inscriptions of a king Hārit putra-Sātakarṇi of the Viṇhukaḍḍa-Chuṭu family, reigning at Vaijayantī, *i.e.* Banawāsi, which disclose the existence there of another branch, apparently known as the Chuṭu family and having its origin at a place named Vishṇugarta, of the great stock to which the Sātavāhana-Sātakarṇis belonged. And another Maḷavaḷḷi inscription, of a king Śiva-Skandavarman, shows that the Sātakarṇis of that locality were followed by a line of kings known as the Kadambas, who left descendants who continued to rule until about A.D. 650. From the other side of Southern India, an inscription from the stūpa at Jaggayyapēṭa in the Kistna district, Madras, referable to the 3rd century A.D., gives us a king Māḍharīputra-Śrī-Vīra-Purushadatta, of the race of Ikshvāku. And some Prākṛit copperplate inscriptions from the same district, referable to the 4th century, disclose a line of Pallava kings at Kāñchī, the modern Conjeeveram near Madras, whose descendants, from about A.D. 550, are well known from the later records.

Reverting to Northern India, we have from the extreme north-west a few inscriptions dated in the era of 58 B.C. which carry us on to A.D. 322. The tale is then taken up chiefly by the records of the great Gupta kings of Pāṭaliputra, *i.e.* Patna, who rose to power in A.D. 320, and gradually extended their sway until it assumed dimensions almost commensurate with those of Aśōka and Kaṇishka: the records of this series are somewhat numerous; and a very noteworthy one amongst them is the inscription of Samudragupta, incised at some time about A.D. 375 on one of the pillars of Aśōka now standing at Allahābād, which gives us a wide insight into the political divisions, with their contemporaneous rulers, of both Northern and Southern India: it is also interesting because it, or another record of the same king at Ēraṇ in the Saugar district, Central Provinces, marks the commencement of the habitual use of Sanskṛit for inscriptional purposes. The inscriptions of the Gupta series run on to about A.D. 530. But the power of the dynasty had by that time become much curtailed, largely owing to an irruption of the Hūṇs under Tōramāṇa and Mihirakula, who established themselves at Siālkōṭ, the ancient Śākala, in the Punjab. We have inscriptional records of these two persons, not only from Kura in the Salt Range, not very far from Siālkōṭ, but also from Ēraṇ and from Gwālior. And next after these we have inscriptions from Mandasōr in Mālwā, notably on two great monolith pillars of victory, of a king Vishṇuvardhana-Yaśōdharman, which show that he overthrew Mihirakula shortly before A.D. 532, and, describing him as subjugating territories to which not even the Guptas and the Hūṇs had been able to penetrate, indicate that he in his turn established for a while another great paramount sovereignty in Northern India.

We have thus brought our survey of the inscriptions of India down to the 6th century A.D. There then arose various dynasties in different parts of the country: in Northern India, in Kāṭhiāwār, the Maitrakas of Valabhī; at Kanauj, the Maukharis, who, after no great lapse of time, were followed by the line to which belonged the great Harshavardhana, "the warlike lord (as the southern records style him) of all the region of the north;" and, in Behār, another line of Guptas, usually known as the Guptas of Magadha: in Southern India, the Chalukyas, who, holding about A.D. 625 the whole northern part of Southern India from sea to sea, then split up into two branches, the Western Chalukyas of Bādāmi in the Bijāpūr district, Bombay, and the Eastern Chalukyas of Veṅgī in the Godāvarī district, Madras; and, below them, the successors of the original Pallavas of Kāñchī (Conjeeveram). These all had their time, and passed away. And they and their successors have left us so great a wealth of inscriptional records that no further detailed account can be attempted within the limits available here. We must pass on to a few brief remarks about the language of the records and the characters in which they were written.

Alphabets.

The inscriptions of Aśōka present two alphabets, which differ radically and widely: one of them is known as the Brāhmī; the other, as the Kharōshṭhī or Kharōshṭrī. For the decipherment of the Brāhmī alphabet we are indebted to James Prinsep, who determined the value of practically all the letters between 1834 and 1837. The decipherment of the Kharōshṭhī alphabet was a more difficult and a longer task: it was virtually finished, some twenty years later, by the united efforts of C. Masson, Prinsep, C. L. Lassen, H. H. Wilson, E. Norris, Sir A. Cunningham, and John Dowson; but there are still a few points of detail in respect of which finality has not been attained.

The Kharōshṭhī script was written from right to left, and is undeniably of Semitic origin; and the theory about it, based on the known fact that the valley of the Indus was a Persian satrapy in the time of Darius (521–485 B.C.), is that the Aramaic script was then introduced into that territory, and that the Kharōshṭhī is an adaptation of it. Except in a few intrusive cases, the use of the Kharōshṭhī in India was limited to the valley of the Indus, and to the Punjab as defined on the south by the territory watered by the Biās (Beas) and the Satlaj (Sutlej): and the eastern locality of the meeting of the two alphabets is marked by coins bearing Kharōshṭhī and Brāhmī legends which come from the districts of the Jālandhar (Jullundhur) division, and by two short rock-cut records, each presented in both the alphabets, at Paṭhyār and Kanhiāra in the Kāṅgra valley. Outside India, this script was notably current in Afghānistān; and documents written in it have in recent years been found in Chinese Turkestān. In India it continued in use, as far as our present knowledge goes, down to A.D. 343.

The Brāhmī alphabet, written from left to right, belonged to the remainder of India; but it must also have been current in learned circles even in the territory where popular usage favoured the other script. Various views about its origin have been advanced: amongst them is the theory that it was derived from the oldest north-Semitic alphabet, which prevailed from Phoenicia to Mesopotamia, and may, it is held, have been introduced into India by traders at some time about 800 B.C. It is, however, admitted that the earliest known form of the Brāhmī is a script framed by Brāhmaṇs for writing Sanskṛit. Also, the theory is largely based on a coin from Ēraṇ, in the Saugar district, Central Provinces, presenting a Brāhmī legend running retrograde from right to left; from which it is inferred that that was the original direction of this writing, and that the script eventually assumed the other direction, which alone it has in the inscriptions, after passing, like the Greek, through a stage in which the lines were written in both directions alternately. But we can cite many instances in which ancient die-sinkers were careless, wholly or partially, in the matter of reversing the legends on their dies, with the result that not only syllables frequently, but sometimes entire words, stand in reverse on the coins themselves; moreover, the Ēraṇ coin, being one of the earliest known Indian coins bearing a legend at all, may quite possibly belong to a period before the time when the desirability of working in reverse on the dies presented itself to the Indian die-sinkers. In all the circumstances, the evidence of the Ēraṇ coin cannot be regarded as conclusive; and we require some inscription on stone, or at least some longer record on metal than a brief legend of five syllables, to satisfy us that the Brāhmī writing ever had a direction different from that which it has in the inscriptions. Further, if there is any radical connexion between the Brāhmī and the Semitic alphabet indicated above, so many curious and apparently capricious changes must have been made, in adapting that alphabet, that it would seem more probable that the two scripts were derived from a joint original source. In view of the high state of civilization to which the Hindus had evidently attained even before the time of Chandragupta, the grandfather of Aśōka, it must still be regarded as possible that they were the independent inventors of that which was emphatically their national alphabet. The Brāhmī alphabet is the parent of all the modern Hindu scripts, including on one side the Nāgarī or Dēvanāgarī, and on the other the widely dissimilar rounded forms of the Kanarese, Tamiḷ, Telugu, and other southern alphabets; and the inscriptions enable us to trace clearly the gradual development of all the modern forms.

Languages.

The great classical Indian language, Sanskṛit, is not found in any inscriptional records of the earliest times. It is not, however, to be supposed therefrom that the use and cultivation of Sanskṛit ever lay dormant, and that there was a revival of this language when it did eventually come to be used in the inscriptions; the case simply is that, during the earlier periods, Sanskṛit was not known much, if at all, outside the Brāhmaṇical and other literary and priestly circles, and so was not recognized as a suitable medium for the notifications which were put on record in the inscriptions for the information of the people at large.

In Northern India, the inscriptions of the period before 58 B.C. present various early Prākṛits, *i.e.* vernaculars more or less derived from Sanskṛit or brought into a line with it. From 58 B.C., however, the influence of Sanskṛit began to manifest itself in the inscriptions, with the result that the records present from that time a language which is conveniently known as the mixed dialect, meaning neither exactly Prākṛit nor exactly Sanskṛit, but Prākṛit with an intermixture of Sanskṛit terminations and some other features; and we have, in fact, from Mathurā (Muttra), a locality which has yielded interesting remains in various directions, a short Brāhmanical inscription of 33 B.C. which was written wholly in Sanskṛit. The mixed dialect appears to have been the general one for inscriptional purposes in Northern India until about A.D. 320. But a remarkable exception is found in the inscription of Rudradāman, dated in A.D. 150, at Junāgaḍh in Kāṭhiāwār (mentioned on a preceding page), which is a somewhat lengthy record composed in thoroughly good literary Sanskṛit prose. Also, the extant inscriptions of the descendants of Rudradāman—(but only four of their records, ranging from A.D. 181 to 205, are at present available for study)—are in almost quite correct Sanskṛit; and this suggests that, from his time, the language may have been habitually used for inscriptional purposes in the dominions of his dynasty. That, however, is only a matter of conjecture; and elsewhere pure and good Sanskṛit, without any Prākṛit forms, appears next, and is found in verse as well as in prose, in the two inscriptions from Ēraṇ and Allahābād, referable to the period about A.D. 340 to 375, of the great Gupta king Samudragupta. From that time onwards, as far as our present knowledge goes, Sanskṛit, with a very rare introduction of Prākṛit or vernacular forms, was practically the only inscriptional language in the northern parts of India. We can, however, cite a record of A.D. 862 from the neighbourhood of Jōdhpur in Rājputānā, the body of which was written in Māhārāshṭrī Prākṛit.

In Southern India we have an instance of the mixed dialect in the Nāsik inscription, referable to A.D. 257 or 258, of the Ābhīra king Īśvarasēna, son of Śivadatta, which has been mentioned on a preceding page. With the exception, however, of that record and of the few which are mentioned just below, the inscriptional language of Southern India appears to have been generally Prākṛit of one kind or another until about A.D. 400, or perhaps even somewhat later. Sankṛit figures first in one of the records at Nāsik of Ṛishabhadatta (Ushavadāta), son-in-law of the Kshaharāta king Nahapāna, which consequently gives it almost as early an appearance in the south as that which is established for it in the north; but it is confined in this instance to a preamble which recites the previous donations and good works of Ṛishabhadatta; the record passes into Prākṛit for the practical purpose for which it was framed. Sanskṛit figures next, in an almost correct form, in the short inscription of not much later date at Kaṇheri, near Bombay, of the queen (her name is not extant) of Vāsishṭhīputra-Śrī-Śātakarṇi. It next appears in certain formulae, and benedictive and imprecatory verses, which stand at the end of some of the Prākṛit records of the Pallava series referable to the 4th century; but here we have quotations from books, not instances of original composition. We have a Sanskṛit record, obtained in Khāndēsh but probably belonging to some part of Gujarāt, of a king named Rudradāsa, which is perhaps dated in A.D. 367. But the next southern inscription in Sanskṛit, of undeniable date, is a record of A.D. 456, belonging to the Vyārā subdivision of the Baroda state in Gujarāt, of the Traikūṭaka king Dahrasēna. The records of the early Kadamba kings of Banawāsi in North Kanara, Bombay, exhibit the use of Sanskṛit from an early period in the 6th century; and records of the Pallava kings show it from perhaps a somewhat earlier time on the other side of India. The records of the Chalukya kings present Sanskṛit from A.D. 578 onwards. And from this latter date the language figures freely in the southern records. But some of the vernaculars, in their older forms, shortly begin to present themselves alongside of it; and, without entirely superseding Sanskṛit even to the latest times, the use of them for inscriptional purposes became rapidly more and more extensive. The vernacular that first makes its appearance is Kanarese, in a record of the Chalukya king Maṅgalēśa, of the period A.D. 597 to 608, at Bādāmi in the Bijāpūr district, Bombay. Tamiḷ appears next, between about A.D. 610 and 675, in records of the Pallava king Mahēndravarman I. at Vallam in the Chingalpat (Chingleput) district, Madras, and of his great-grandson Paramēśvaravarman I. from Kūram in the same district. Telugu appears certainly in A.D. 1011, in a record of the Eastern Chalukya king Vimalāditya; and it is perhaps given to us in A.D. 843 or 844 by a record of his ancestor Vishṇuvardhana V.; in the latter case, however, the authenticity of the document is not certain. Malayālam appears about A.D. 1150, in inscriptions of the rulers of Kēraḷa from the Travancore state. And on the colossal image of Gommaṭēśvara at Śravaṇa-Beḷgoḷa, in Mysore, there are two lines of Marāṭhī, notifying for the benefit of pilgrims from the Marāṭhā country the names of the persons who caused the image and the enclosure to be made, which are attributed to the first quarter of the 12th century: this language, however, figures first for certain in a record of A.D. 1207, of the time of the Dēvagiri-Yādava king Siṅghaṇa, from Khāndēsh in the north of Bombay.

BIBLIOGRAPHY.—The systematic publication of the Indian inscriptions has not gone far. Cunningham inaugurated a *Corpus Inscriptionum Indicarum*, by giving us in 1877 the first volume of it, dealing with the records of Aśōka; but the only other volume which has been published is vol. iii., by Fleet, dealing with the records of the Gupta series. The other published materials are mostly to be found here and there in the *Journals* of the Royal Asiatic Society of London, its Bombay branch, and the Asiatic Society of Bengal, in the *Reports* of the various Archaeological Surveys, and in the *Indian Antiquary*, the *Epigraphia Indica* and the *Epigraphia Carnatica*; and much work has still to be done in bringing them together according to the periods and dynasties to which they relate, and in revising some of them in the light of new discoveries and the teachings of later research. The authority on Indian palaeography is Bühler's work, published in 1896 as part 2 of vol. i of the *Grundriss der Indo-Arischen Philologie und Altertumskunde*; an English version of it was issued in 1904 as an appendix to the *Indian Antiquary*, vol. xxxiii. (J. F. F.)

III. Greek Inscriptions

Etymologically the term inscription (ἐπιγραφή) would include much more than is commonly meant by it. It would include words engraved on rings, or stamped on coins,[1] vases, lamps, wine-jar handles,[2] &c. But Boeckh was clearly right in excluding this *varia supellex* from his *Corpus Inscriptionum Graecarum*, or only admitting it by way of appendix. Giving the term inscription a somewhat narrower sense, we still include within it a vast store of documents of the greatest value to the student of Greek civilization. It happens, moreover, that Greek inscriptions yield the historian a richer harvest than those of Rome. Partly from fashion, but partly from the greater abundance

[1] The legends on coins form part of numismatics, though closely connected with inscriptions.

[2] The amphorae which conveyed the wine and other products of various localities have imprinted on their handles the name of the magistrate and other marks of the place and date. Large collections have been made of them, and they repay inquiry. See Dumont, *Inscriptions céramiques* (1872); Paul Becker, *Henkelinschriften* (Leipzig, pt. i. 1862, pt. ii. 1863); Hiller v. Gaertringen, *I.G.* xii. 1065–1441.

of the material, the Romans engraved their public documents (treaties, laws, &c.) to a large extent on bronze. These bronze tablets, chiefly set up in the Capitol, were melted in the various conflagrations, or were carried off to feed the mint of the conqueror. In Greece, on the contrary, the mountains everywhere afforded an inexhaustible supply of marble, and made it the natural material for inscriptions. Some Greek inscribed tablets of bronze have come down to us,[1] and many more must have perished in the sack of cities and burning of temples. A number of inscriptions on small thin plates of lead, rolled up, have survived; these are chiefly imprecations on enemies[2] or questions asked of oracles.[3] An early inscription recently discovered (1905) at Ephesus is on a plate of silver. But as a rule the material employed was marble. These marble monuments are often found *in situ*; and, though more often they were used up as convenient stones for building purposes, yet they have thus survived in a more or less perfect condition.[4]

Inscriptions were usually set up in temples, theatres, at the side of streets and roads, in τεμένη or temple-precincts, and near public buildings generally. At Delphi and Olympia were immense numbers of inscriptions—not only those engraved upon the gifts of victorious kings and cities, but also many of a more public character. At Delphi were inscribed the decrees of the Amphictyonic assembly, at Olympia international documents concerning the Peloponnesian cities; the Parthenon and Acropolis were crowded with treaties, laws and decrees concerning the Athenian confederation; the Heraeum at Samos, the Artemisium at Ephesus, and indeed every important sanctuary, abounded with inscriptions. It is a common thing for decrees (ψηφίσματα) to contain a clause specifying where they are to be set up, and what department of the state is to defray the cost of inscribing and erecting them. Sometimes duplicates are ordered to be set up in various places; and, in cases of treaties, arbitrations and other international documents, copies were always set up by each city concerned. Accordingly documents like the *Marmor Ancyranum* and the *Edict of Diocletian* have been restored by a comparison of the various fragments of copies set up in diverse quarters of the empire.

Greek inscribed marbles varied considerably in their external appearance. The usual form was the στήλη, the normal type of which was a plain slab, from 3 to 4 or even 5 ft. high,[5] 3 or 4 in. thick, tapering slightly upwards from about 2 ft. wide at bottom to about 18 in. at the top, where it was either left plain or often had a slight moulding, or still more commonly was adorned with a more or less elaborate pediment; the slab was otherwise usually plain. Another form was the βωμός or altar, sometimes square, oftener circular, and varying widely in size. Tombstones were either στῆλαι (often enriched beneath the pediment with simple groups in relief, commemorative of the deceased), or κίονες, pillars, of different size and design, or sarcophagi plain and ornamental. To these must be added statue-bases of every kind, often inscribed, not only with the names and honours of individuals, but also with decrees and other documents. All these forms were intended to stand by themselves in the open air. But it was also common to inscribe state documents upon the surface of the walls of a temple, or other public building. Thus the antae and external face of the walls of the pronaos of the temple of Athena Polias at Priene were covered with copies of the awards made concerning the lands disputed between Samos and Priene (see *Gk. Inscr. in Brit. Mus.* iii. § 1); similarly the walls of the Artemisium at Ephesus contained a number of decrees (*ibid.* iii. § 2), and the *proscenium* of the Odeum was lined with crustae, or "marble-veneering," under 1 in. thick, inscribed with copies of letters from Hadrian, Antoninus and other emperors to the Ephesian people (*ibid.* p. 151). The workmanship and appearance of inscriptions varied considerably according to the period of artistic development. The letters incised with the chisel upon the wall or the στήλη were painted in with red or blue pigment, which is often traceable upon newly unearthed inscriptions. When Thucydides, in quoting the epigram of Peisistratus the younger (vi. 54), says "it may still be read ἀμυδροῖς γράμμασι," he must refer to the fading of the colour; for the inscription was brought to light in 1877 with the letters as fresh as when they were first chiselled (see Kumanudes in Ἀθήναιον, vi. 149; *I.G.* suppl. to vol. i. p. 41). The Greeks found no inconvenience, as we should, in the bulkiness of inscriptions as a means of keeping public records. On the contrary they made every temple a muniment room; and while the innumerable στῆλαι, *Hermae*, bases and altars served to adorn the city, it must also have encouraged and educated the sense of patriotism for the citizen to move continually among the records of the past. The history of a Greek city was literally written upon her stones.

The primary value of an inscription lay in its documentary evidence (so Euripides, *Suppl.* 1202, fol.). In this way they are continually cited and put in evidence by the orators (*e.g.* see Demosth. *Fals. Leg.* 428; Aeschin. *In Ctes.* § 75). But the Greek historians also were not slow to recognize their importance. Herodotus often cites them (iv. 88, 90, 91, v. 58 sq., vii. 228); and in his account of the victory of Plataea he had his eye upon the tripod-inscription (ix. 81; cf. Thuc. i. 132). Thucydides's use of inscriptions is illustrated by v. 18 fol., 23, 47, 77, vi. 54, 59. Polybius used them still more. In later Greece, when men's thoughts were thrown back upon the past, regular collections of inscriptions began to be made by such writers as Philochorus (300 B.C.), Polemon (2nd century B.C., called στηλοκόπας for his devotion to inscriptions), Aristodemus, Craterus of Macedon, and many others.

At the revival of learning, the study of inscriptions revived with the renewed interest in Greek literature. Cyriac of Ancona, early in the 15th century, copied a vast number of inscriptions during his travels in Greece and Asia Minor; his MS. collections were deposited in the Barberini library at Rome, and have been used by other scholars. (See *Bull. Corr. Hellên.* i.; Larfeld in Müller's *Handbuch* i.², p. 368 f.; Ziebarth, "de ant. Inscript. Syllogis" in *Ephem. Epigr.* ix.). Succeeding generations of travellers and scholars continued to collect and edit, and Englishmen in both capacities did much for this study.

Thus early in the 19th century the store of known Greek inscriptions had so far accumulated that the time had come for a comprehensive survey of the whole subject. And it was the work of one great scholar, Augustus Boeckh, to raise Greek epigraphy into a science. At the request of the Academy of Berlin he undertook to arrange and edit all the known inscriptions in one systematic work, and vol. i. of the *Corpus Inscriptionum Graecarum* was published in 1828, vol. ii. in 1833. He lived to see the work completed, although other scholars were called in to help him to execute his great design; vol. iii., by Franz, appeared in 1853; vol. iv., by Kirchhoff, in 1856.[1] The work is a masterpiece of lucid arrangement and profound learning, of untiring industry and brilliant generalization. Out of the publication of the *Corpus* there grew up a new school of students, who devoted themselves to discovering and editing new texts, and working up epigraphical results into monographs upon the many-sided history of Greece. In the *Corpus* Boeckh had settled for ever the methods of Greek epigraphy; and in his *Staatshaushaltung der Athener* (3rd ed. of vols. i. ii. by Fränkel, 1886; well known to English readers from Sir G. C. Lewis's translation, *The Public Economy of Athens*, 2nd ed., 1842) he had given a palmary specimen of the application of epigraphy to historical studies. At the same time Franz drew up a valuable introduction to the study of inscriptions in his *Elementa Epigraphices Graecae* (1840).

Meanwhile the liberation of Greece and increasing facilities for

[1] *e.g.* Treaty between Elis and the Heraeans, about 550–500 B.C., from Olympia (Boeckh, *C.I.G.* 11, Hicks, 29, and others in Dittenberger-Purgold, *Inschr. v. Olympia*, 1-43); a similar bronze treaty from the Locri Ozolae (Dittenberger, *I.G.* ix. 334); bronze plate from Dodona, recording the victory of Athens over the Lacedaemonians in a sea-fight, probably 429 B.C. (Dittenberger, *Syll.* 2. 30).

[2] See Wünsch *I.G.* iii., App.; Audollent, *Defixionum Tabellae* (1904).

[3] See Karapanos, *Dodone et ses ruines*; Hoffman, *Gr. Dial. Inschr.* 1558–1598.

[4] What was done by Themistocles under stress of public necessity (Thucyd. i. 93) was done by others with less justification elsewhere; and from Byzantine times onward Greek temples and inscriptions were found convenient quarries.

[5] It appears from Cicero, *De Legibus*, ii. 26, 27, that the size of Athenian gravestones was limited by law.

[1] An index to the four volumes was long wanting; it was at length completed and appeared in 1877.

visiting the Levant combined to encourage the growth of the subject, which has been advanced by the labours of many scholars, and chiefly Ludwig Ross, Leake, Pittakys, Rangabé, Le Bas and later by Meier, Sauppe, Kirchhoff, Kumanudes, Waddington, Köhler, Dittenberger, Homolle, Haussoullier, Wilhelm and others. Together with the development of this school of writers, there has gone on a systematic exploration of some of the most famous sites of antiquity, with the result of exhuming vast numbers of inscriptions. To mention only some of the most important: Cyrene, Rhodes, Cos, Cnidus, Halicarnassus, Miletus, Priene, Ephesus, Magnesia on the Maeander, Pergamum, Delos, Thera, Athens, Eleusis, Epidaurus, Olympia, Delphi, Dodona, Sparta, have been explored or excavated by the Austrians, English, French, Germans and Greeks. German, French, British, Austrian and American institutes have been established at Athens, to a great extent engaged in the study of inscriptions. From every part of the Greek world copies of inscriptions are brought home by the students of these institutes and by other travellers. And still the work proceeds at a rapid rate. For indeed the yield of inscriptions is practically inexhaustible: each island, every city, was a separate centre of corporate life, and it is significant to note that in the island of Calymnos alone C. T. Newton collected over one hundred inscriptions, many of them of considerable interest.

The result of this has been that Boeckh's great work, though it never can be superseded, yet has ceased to be what its name implies. The four volumes of the *C.I.G.* contain about 10,000 inscriptions. But the number of Greek inscriptions now known is probably more than three or four times as great. Many of these are only to be found published in the scattered literature of dissertations, or in Greek, German and other periodicals. But several comprehensive collections have been attempted, among which (omitting those dealing with more limited districts of the Greek world) the following may be named:—Rangabé, *Antiquités helléniques* (2 vols., 1842–1855); Le Bas-Waddington, *Voyage archéologique, inscriptions* (3 vols., 1847–1876, incomplete); Newton, Hicks and Hirschfeld, *Greek Inscriptions in the British Museum* (parts i.-iv.); and above all the *Inscriptiones Graecae*, a Corpus undertaken by the Berlin Academy (absorbing the *Corpus Inscr. Attic.* and other similar collections). Of this work six complete volumes and parts of others have appeared (by 1906) representing Attica, Argolis, Megaris, Boeotia, Phocis, Locris, Aetolia, Acarnania, Ionian Islands, Aegean Islands (exc. Delos), Sicily, Italy and western Europe; they are edited by Kirchhoff, Köhler, Dittenberger, Fränkel, Hiller von Gaertringen, Kaibel and others. Of a similar Austrian publication dealing with Asia Minor (*Tituli Asiae Minoris*) only the first part (Lycian Inscriptions) has appeared. Of general selections of inscriptions on a smaller scale it is necessary to mention: Dittenberger, *Sylloge Inscriptionum Graec.* (2nd ed., 1898–1901, 3 vols.); the same, *Orientis Graeci Inscr. Selectae* (2 vols., 1903–1905); Hicks, *Greek Historical Inscriptions* (1st ed., 1882; 2nd ed., 1901); Michel, *Recueil d'inscriptions grecques* (1900); Roberts and Gardner, *Introd. to Gk. Epigraphy* (2 vols., 1887–1905); Röhl, *Inscr. gr. antiquissimae* (1882), and *Imagines Inscriptionum* (2nd ed., 1898).

Oldest Greek Inscriptions.

The oldest extant Greek inscriptions appear to date from the middle of the 7th century B.C. During the excavations at Olympia a number of fragments of very ancient inscriptions were found (see *Olympia, Textband* v.); and other very early inscriptions from various places, as Thera and Crete, have been published (see Röhl, *op. cit.*). But what is wanted is a sufficient number of very early inscriptions of fixed date. One such exists upon the leg of a colossal Egyptian statue at Abu-Simbel on the upper Nile, where certain Greek mercenaries in the service of King Psammetichus recorded their names, as having explored the river up to the second cataract (*C.I.G.* 5126; Röhl, 482; Hicks[2], 3). Even if Psammetichus II. is meant, the inscription dates between 594 and 589 B.C. Another, but later, instance is to be found in the fragmentary inscriptions on the columns dedicated by Croesus in the Ephesian temple (*c.* 550 B.C.; *Gk. Inscr. in the Brit. Mus.* 518). Documents earlier than the Persian War are not very frequent; but after that period the stream of Greek inscriptions goes on, generally increasing in volume, down to late Byzantine times.

Greek inscriptions may most conveniently be classified under the following heads: (1) those which illustrate political history; (2) those connected with religion; (3) those of a private character.

Political Inscriptions.

1 Foremost among the inscriptions which illustrate Greek history and politics are the *decrees* of senate and people (ψηφίσματα βουλῆς, ἐκκλησίας, &c.) upon every subject which could concern the interests of the state. These abound from every part of Greece. It is true that a large number of them are honorary, *i.e.* merely decrees granting to strangers, who have done service to the particular city, public honours (crowns, statues, citizenship and other privileges). One of these privileges was the *proxenia*, an honour which entailed on the recipient the burthen of protecting the citizens of the state which granted it when they came to his city. But the importance of an honorary decree depends upon the individual and the services to which it refers. And even the mere headings and datings of the decrees from various states afford curious and valuable information upon the names and titles of the local magistrates, the names of months and other details. On the formulae, see Swoboda, *Die gr. Volksbeschlüsse* (1890). Droysen in his *Hellenismus* (1877–1878) has shown how the history of Alexander and his successors is illustrated by contemporary ψηφίσματα. And when the student of Athenian politics of the 5th and 4th centuries turns to the 1st and 2nd volumes of the *I.G.*, he may wonder at the abundance of material before him; it is like turning over the minutes of the Athenian parliament. One example out of many must suffice—No. 17 in *I.G.* ii. pt. 1 (Hicks[2], 101) is the famous decree of the archonship of Nausinicus (378 B.C.) concerning the reconstruction of the Athenian confederacy. The terms of admission to the league occupy the face of the marble; at the bottom and on the left edge are inscribed the names of states which had already joined.

Inscribed *laws* (νόμοι) occur with tolerable frequency. The following are examples:—A citation of a law of Draco's from the πρῶτος ἄξων of Solon's laws (*I.G.* i. 61; cf. Dittenberger, *Syll.*[2] 52); the Civil Codes of Gortyna (5th century, Dareste, &c., *Inscr. jurid. gr.* i. 352 ff.); a reassessment of the tribute payable by the Athenian allies in 425 B.C. (*I.G.* i. 37; Köhler *Urkunden und Untersuchungen zur Geschichte des delisch-attischen Bundes*, 1870, p. 63; Hicks[2], 64); a law passed by the Amphictyonic council at Delphi, 380 B.C. (Boeckh, *C.I.G.* 1688; *I.G.* ii. 545); law concerning Athenian weights and measures (Boeckh, *Staatshaushaltung*[3], ii. 318; *I.G.* ii. 476); the futile sumptuary law of Diocletian concerning the maximum prices for all articles sold throughout the empire (Mommsen-Blümner, *Der Maximaltarif des Diocletian*, 1893). For a collection of such legal documents, see Dareste, Haussoullier and Reinach, *Recueil des inscr. juridiques gr.* (1891–1898).

Besides the inscribed *treaties* previously referred to, we may instance the following: Between Athens and Chalcis in Euboea, 446 B.C. (*I.G.* suppl. to vol. i. 27A); between Athens and Rhegium, 433 B.C. (Hicks[2], 51); between Athens and Leontini, dated the same day as the preceding (*ibid.* 52); between Athens and Boeotia, 395 B.C. (*ibid.* 84); between Athens and Chalcis, 377 B.C. (*ibid.* 102); between Athens and Sparta, 271 B.C. (*I.G.* ii. No. 332); between Hermias of Atarneus and the Ionian Erythrae, about 350 B.C. (Hicks[2] 138); treaties in the local dialect between the Eleans and the Heraeans, 6th century (*Olympia Inschr.* 9), and between various cities of Crete, 3rd century B.C. (*C.I.G.* 2554-2556; *Griech. Dial. Inschr.* 5039-5041, 5075). Egger's *Études historiques sur les traités publics chez les Grecs et chez les Romains* (Paris, 1866) embraces a good many of these documents; see also R. von Scala, *Die Staatsverträge des Altertums*, pt. i. (1898).

The international relation of Greek cities is further illustrated by *awards* of disputed lands, delivered by a third city called in (ἔκκλητος πόλις) to arbitrate between the contending states, *e.g.* Rhodian award as between Samos and Priene (*Gk. Inscr. in Brit. Mus.* 405; Dittenberger, *Syll.*[2] 315); Milesian between Messanians and Spartans, discovered at Olympia (*ibid.* 314; see Tac. *Ann.* iv. 43); and many others. Akin to these are decrees in honour of judges called in from a neutral city to try suits between citizens which were complicated by political partisanship (see *C.I.G.* No. 2349B, with Boeckh's remarks; *I.G.* xii. 722). On the general subject, E. Sonne, *De arbitris externis* (1888).

Letters from kings are frequent; as from Darius I. to the satrap Gadates, with reference to the shrine of Apollo at Magnesia (Hicks[2], 20); from Alexander the Great to the Chians (*ibid.* 158); from Lysimachus to the Samians (*C.I.G.* 2254; Hicks[1], 152); from Antigonus I. directing the transfer of the population of Lebedus to Teos (Dittenberger, *Syll.*[2] 177); from the same to the Scepsians (Dittenberger, *Or. Gr. Inscr. Sel.* 5). Letters from Roman emperors are commoner still; such as Dittenberger, *Syll.*[2] 350, 356, 373, 384-388, 404.

The internal administration of Greek towns is illustrated by the minute and complete lists of the treasures in the Parthenon of the time of the Peloponnesian War (Boeckh, *Staatshaush.*[3] vol. ii.); public accounts of Athenian expenditure (*ibid.*); records of the Athenian navy in the 4th century, forming vol. iii. of the 1840 ed. of the same work. To the same category belong the so-called Athenian tribute-lists, which are really lists of the quota (of the tribute paid by the Athenian allies) which was due to the treasury of Athena (ἀπαρχαὶ τῇ θεῷ μνᾶ ἀπο ταλάντου). Being arranged according to the tributary cities, they throw much light on the constitution of the Athenian empire at the time (*I.G.* i. 226-272 and suppl. p. 71 f.; Köhler, *Urkunden und Untersuchungen zur Gesch. des attisch-delischen Seebundes* 1870; Boeckh, *Staatshaush.*[3] ii. 332-498). The management of public lands and mines is specially illustrated from inscriptions (Boeckh, *op. cit.* vol. i. *passim*); and the political constitution of different cities often receives light from inscriptions which cannot be gained elsewhere (*e.g.* see the document from Cyzicus, *C.I.G.* 3665, and Boeckh's note, or that from Mytilene, Dittenberger, *Or. Gr. Inscr.* 2, and the inscriptions from Ephesus, *Gk. Inscr. in Brit. Mus.* pt. iii. § 2).

Inscriptions in honour of kings and emperors are very common. The *Marmor Ancyranum* (ed. Mommsen,[2] 1883) has already been mentioned; but an earlier example is the *Monumentum Adulitanum* (from Abyssinia, *C.I.G.* 5127A); Dittenberger, (*Inscr. or. Gr.* 54) reciting the achievements of Ptolemy III. Euergetes I.

Offerings in temples (ἀναθήματα) are often of great historical value, *e.g.* the dedications on the columns of Croesus at Ephesus mentioned above; Gelo's dedication at Delphi, 479 B.C. (Hicks[2] 16); the helmet of Hiero, now in the British Museum, dedicated at Olympia after his victory over the Etruscans, 474 B.C. (*C.I.G.* 16; Hicks[2] 22); and the bronze base of the golden tripod dedicated at Delphi after the victory of Plataea, and carried off to Constantinople by Constantine (Dethier and Mordtmann, *Epigraphik von Byzantion*, 1874; Hicks[2] 19).

Religious Inscriptions.

2. The religion of Greece in its external aspects is the subject of a great number of inscriptions (good selections in Dittenberger, *Syll.*[2] 550-816, and Michel 669-1330). The following are a few specimens. (1) Institution of festivals, with elaborate ritual directions: see Sauppe, *Die Mysterieninschrift aus Andania* (1860); Dittenberger, *Syll.*[2] 653, and the singular document from the Ephesian theatre in *Gk. Inscr. in Brit. Mus.* 481; the following also relate to festivals—*C.I.G.* 1845, 2360, 2715, 3059, 3599, 3641*b*; Dittenberger, *Syll.*[2] 634 (the lesser Panathenaea), and *Or. Gr. Inscr.* 383 (law of Antiochus I. of Commagene). (2) Laws defining the appointment, duties or perquisites of the priesthood: Dittenberger, *Syll.*[2] 601; Boeckh, *Staatshaush.* ii. 109 seq. (3) Curious calendar of sacrifices from Myconus: Dittenberger, *Syll.*[2] 615. (4) Fragment of augury rules, Ephesus, 6th century B.C.: ibid. 801. (5) Leases of τεμένη and sacred lands (see Dareste, &c., *Inscr. jur. Gr.* ii. § 19 and commentary). (6) Imprecations written on lead, and placed in tombs or in temples: Wünsch, *I.G.* iii. App.; Audollent, *Defixionum tabellae* (1904). (7) Oracles are referred to *I.G.* xii. 248; Michel 840-856. (8) Among the inscriptions from Delphi few are more curious than those relating to the enfranchisement of slaves under the form of sale to a god (see *Gr. dial. Inschr.* nos. 1684-2342; for enfranchisement-inscriptions of various kinds, Dareste, &c., *Inscr. jur. Gr.* § xxx. (9) Cures effected in the Asclepieum at Epidaurus (Dittenberger, *Syll.*[2] 802-805). (10) Inventories, &c., of treasures in temples: Michel 811-828, 832, 833, &c. (11) Inscriptions relating to dramatic representations at public festivals: A. Wilhelm, *Urkunden dramatischer Aufführungen in Athen* (Vienna, 1906). This catalogue might be enlarged indefinitely.

Private Inscriptions.

3. There remain a large number of inscriptions of a more strictly private character. The famous Parian marble (*I.G.* xii. 444) falls under this head; it was a system of chronology drawn up, perhaps by a schoolmaster, in the 3rd century B.C. The excessive devotion of the later Greeks to athletic and other competitions at festivals is revealed by the numerous dedications made by victorious competitors who record their successes (see Michel 915-960; Dittenberger, *Syll.*[2] 683 f.). The dedications and honorary inscriptions relating to the Ephebi of later Athens (which occupy half of *I.G.* iii. pt. 1), dreary as they seem, have yet thrown a curious light upon the academic life of Roman Athens (see A. Dumont, *Essai sur l'éphébie attique*; Reinach, *Traité*, pp. 408-418; Roberts and Gardner ii. 145); and from these and similar late inscriptions the attempt has been made to construct *Fasti* of the later archons (von Schöffer in Pauly-Wissowa, *Realencyklopädie*, *s.v.* "Archontes"; W. S. Ferguson in *Cornell Studies*, x). The sepulchral monuments have been beautifully illustrated in Stackelberg's *Gräber der Hellenen*; for the Attic stelae see Conze, *Die attischen Grabreliefs* (1893 ff.). Some of the most interesting epitaphs in the *C.I.G.* are from Aphrodisias and Smyrna. Kumanudes's collection of Attic epitaphs has been mentioned above; see also Gutscher, *Die attischen Grabschr.* (1889); they yield a good deal of information about the Attic demes, and some of them are of high importance, *e.g.* the epitaph on the slain in the year 458 B.C. (Dittenberger, *Syll.*[2] 9), and on those who fell in the Hellespont, *c.* 440 B.C. (Hicks[2] 46). For the metrical inscriptions see Kaibel, *Epigrammata Graeca* (1878). Closely connected with sepulchral inscriptions is the famous "Will of Epicteta" (*I.G.* xii. 330). It was also customary at Athens for lands mortgaged to be indicated by boundary-stones inscribed with the names of mortgagor and mortgagee, and the amount (*I.G.* ii. 1103-1153; Dareste, &c., *Inscr. jur.* i. pp. 107-142); other ὅροι are common enough.

The names of sculptors inscribed on the bases of statues have been collected by E. Löwy (*Inschriften gr. Bildhauer*, 1885). In most cases the artists are unknown to fame. Among the exceptions are the names of Pythagoras of Rhegium, whom we now know to have been a native of Samos (Löwy 23, 24); Pyrrhus, who made the statue of Athena Hygieia dedicated by Pericles (Plut. *Per.* 13; Löwy 53); Polyclitus the younger (Löwy 90 f.), Paeonius of Mende, who sculptured the marble Nike at Olympia (Löwy 49); Praxiteles Löwy 76), &c.

Study of Dialects.

The bearing of inscriptions upon the study of dialects is very obvious. A handy selection has been made by Cauer (*Delectus inscr. Gr.* 2nd ed., Leipzig, 1883) of the principal inscriptions illustrating this subject, and a complete collection is in course of publication (Collitz and others, *Sammlung der griechischen Dialekt-Inschriften*, Göttingen, 1884 ff.). See also R. Meister, *Die griech. Dialekte* (1882–1889), and O. Hoffman, *Die griech. Dialekte* (1891–1898). The grammar of Attic inscriptions is treated by Meisterhans, *Grammatik der att. Inschr.* (3rd ed. by Schwyzer, 1900).

Date of Inscriptions.

The date of inscriptions is determined partly by the internal evidence of the subject, persons, and events treated of, and the character of the dialect and language. But the most important evidence is the form of the letters and style of execution. For the Attic inscriptions the development from the earliest times to about A.D. 500 is elaborately treated by Larfeld, *Handbuch der att. Inschr.* (1902). bk. ii. Much of the evidence is of a kind difficult to appreciate from a mere description. Yet—besides the βουστροφηδόν writing of many early documents—we may mention the contrast between the stiff, angular characters which prevailed before 500 or 450 B.C. and the graceful yet simple forms of the Periclean age. This development was part of the general movement of the time. Inscriptions of this period are usually written στοιχηδόν, *i.e.* the letters are in line vertically as well as horizontally. From the archonship of Eucleides (403 B.C.) onwards the Athenians officially adopted the fuller alphabet which had obtained in Ionia since the 6th century. Before 403 B.C. ξ and ψ were expressed in Attic inscriptions by ΧΣ and ΦΣ, while E did duty for η, ε, and sometimes ει, O for ο, ου, and ω—H being used only for the aspirate. There is, however, occasional use of the Ionic alphabet in Attica, even in official inscriptions, as early as the middle of the 5th century. The Macedonian period betrays a falling off in neatness and firmness of execution—the letters being usually small and scratchy, excepting in inscriptions relating to great personages, when the characters are often very large and handsome. In the 2nd century came in the regular use of *apices* as an ornament of letters. These tendencies increased during the period of Roman dominion in Greece, and gradually, especially in Asia Minor, the *iota adscriptum* was dropped. The Greek characters of the Augustan age indicate a period of restoration; they are uniformly clear, handsome, and adorned with *apices*. The lunate epsilon and sigma (ϵ, C) establish themselves in this period; so does the square form ⊏, and the cursive ω is also occasionally found. The inscriptions of Hadrian's time show a tendency to eclectic imitation of the classical lettering. But from the period of the Antonines (when we find a good many pretty inscriptions) the writing grows more coarse and clumsy until Byzantine times, when the forms appear barbarous indeed beside an inscription of the Augustan or even Antonine age.

Collections of Marbles.

The finest collections of inscribed Greek marbles are of course at Athens. There are also good collections, public and private, at Smyrna and Constantinople. The British Museum contains the best collection out of Athens (see the publication mentioned above); the Louvre contains a good many (edited by Fröhner, *Les Inscriptions grecques du musée du Louvre*, 1865); the Oxford collection is very valuable, and fairly large; and there are some valuable inscriptions also at Cambridge.

Bibliography.—The following essays give good outlines of the whole subject:—Boeckh, *C.I.G.*, preface to vol. i.; C. T. Newton, *Essays on Art and Archaeology* (1880), pp. 95, 209; S. Reinach, *Traité d'épigraphie grecque* (Paris, 1885). Besides the works already quoted the following should be mentioned:—Boeckh's *Kleine Schriften*; Michaelis, *Der Parthenon*; Waddington, *Fastes des provinces asiatiques*, part i. (1872), and *Mémoire sur la chronologie de la vie du rhéteur Aristide*; Kirchhoff, *Studien zur Geschichte des griechischen Alphabets* (4th ed., 1887); Schubert, *De proxenia* (Leipzig, 1881); Monceaux, *Les Proxénies gr.* (Paris, 1886); Latyshev, *Inscr. ant. orae septentr. Ponti Euxini Gr. et Lat.* (2 vols., St Petersburg, 1885–1890); Bechtel, *Inschriften des ionischen Dialekts* (Göttingen, 1887); Paton and Hicks, *Inscriptions of Cos* (Oxford, 1891); Fränkel and others, *Inschriften von Pergamon* (2 vols., Berlin, 1890–1895); Comparetti, *Le Leggi di Gortyna*, &c. (*Monum. antichi*, iii., 1893); E. Hoffmann, *Sylloge epigrammatum Graec.* (Halle a. S., 1893); O. Kern, *Inschriften von Magnesia am Maeander* (Berlin, 1900); S. Chabert, *Histoire sommaire des études d'épigraphie grecque* (Paris, 1906); Hackl, *Merkantile Inschr. auf attischen Vasen* (*Münch, arch. Stud.*, 1909); Wilhelm, *Beiträge zur griech. Inschriftenkunde* (Vienna, 1909). (E. L. H.; G. F. H.*)

IV. Latin Inscriptions

I. Latin or Roman Inscriptions (by which general name are designated, in classical archaeology, all non-literary remains of the Latin language, with the exception of coins, letters and journals) fall into two distinct classes, viz. (1) those which were written upon other objects of various kinds, to denote their peculiar purpose, and in this way have been preserved along with them; and (2) those which themselves are the objects, written, to be durable, as a rule, on metal or stone. The first class is that of *inscriptions* in the stricter sense of the word (styled by the Romans *tituli*, by the Germans *Aufschriften*); the second is that of instruments or charters, public and private (styled by the Romans first *leges*, afterwards *instrumenta* or *tabulae*, and by the Germans *Urkunden*).

No ancient Latin authors have professedly collected and explained or handed down to us Roman inscriptions. Some of the orators and historians, such as Cicero, Livy, Pliny the elder, and Suetonius among the Latins, and Polybius, Dionysius of Halicarnassus and Josephus among the Greeks, occasionally mention inscriptions of high historical interest. A few grammarians, as, for example, Varro, Verrius Flaccus and Valerius Probus of Berytus, quote ancient words or *formulae* from them, or explain the abbreviations used in them. Juridical instruments, laws, constitutions of emperors, *senatus consulta* and the like appear in the various collections of Roman jurisprudence.

Inscriptions (in the wider sense, as we shall henceforth call them without regard to the distinction which has been drawn) have been found in nearly every centre of ancient Roman life, but, like many other remains of antiquity, only seldom in their original sites. The great mass of them has to be sought for in the large European museums of ancient art, and in the smaller local collections of ancient remains which occur nearly everywhere in the European provinces of the former Roman empire as well as in the north of Africa, and also here and there in Asia Minor.

Only those copies of inscriptions are to be received with full confidence which are furnished by experienced and well-equipped scholars, or which have been made with the help of mechanical methods (casts, photographs, moist and dry rubbings), not always applicable with equal success, but depending on the position and the state of preservation of the monuments.[1] From the first revival of classical learning in the Carolingian age attention was paid anew, by pilgrims to Rome and other places worth visiting, to epigraphic monuments also. In the time of the Renaissance, from the end of the 14th century downwards, some of the leading Italian scholars, like Poggio and Signorili, and the antiquarian traveller Cyriacus of Ancona, collected inscriptions, Greek and Latin.[2] In the 15th century large collections of the inscriptions of all countries, or of limited districts, were made by Giovanni Marcanova, Fra Felice Feliciano, Fra Michele Ferrarino, Fra Giocondo the architect of Verona, Marino Sanudo the Venetian polyhistor, and others. At the end of the 15th and the beginning of the 16th, the first printed collections can be recorded (Spreti's for Ravenna, 1489; Peutinger's for Augsburg, 1508; Huttich's for Mainz, 1520; Francesco degli Albertini's for Rome, printed in 1521 by Jacopo Mazochi), while during the same century a long list of epigraphic travellers, like Pighius, Rambertus and Accursius, or antiquarian collectors, like Sigonius, Panvinius, Antonius Augustinus with his collaborators Ursinus and Metellus, and many others, were busy in augmenting the stock of epigraphic monuments. The series of printed epigraphic *Corpora* begins with that of Apianus (Ingolstadt, 1534), the only one arranged in geographical order, and is continued in those of Smetius (1558, but edited only after the author's death by Justus Lipsius, 1588), Gruter (with Joseph Scaliger's *Indices*, 1603, and re-edited by Graevius, 1707), Gudius (about 1660, edited by Hessel, 1731), Reinesius (1682), Fabretti (1699), Gori (1726), Doni (1731), Muratori (1739), Maffei (1749), Donati (1765–1775). These collections, manuscript and printed, will never altogether lose their value, as great numbers of inscriptions known to the ancient collectors have since been lost or destroyed. But, inasmuch as even towards the beginning of the 15th century, as well as afterwards, especially from the 16th down to a very recent period, all sorts of inaccuracies, interpolations and even downright falsifications, found their way into the *Corpora*, these can be employed only with the greatest caution. Modern critical research in the field of epigraphy began with the detection of those forgeries (especially of the very extensive and skilful ones of Pirro Ligorio, the architect to the house of Este) by Maffei, Olivieri and Marini. The last-named scholar opens a new era of truly critical and scientific handling of Roman inscriptions (especially in his standard work on the *Atti dei fratelli arvali*, Rome, 1795); his disciple and successor, Count Bartolomeo Borghesi (who died at San Marino in 1860), may be rightly called the founder of the modern science of Roman epigraphy.[3] Orelli's handy collection of Roman inscriptions (2 vols., Zurich, 1828) is a first attempt to make accessible to a larger scientific public the results of the researches of Marini and his successors; but it was not completed (and thoroughly corrected) until nearly thirty years later, by Henzen (Orelli, iii., with the indispensable *Indices*, Zurich, 1856), who, with Mommsen and De Rossi, carried out the plan of a universal *Corpus inscriptionum Latinarum*, previously projected by Maffei (1732), by Kellermann and Sarti (1832), with Borghesi's help, and by Letronne and Egger (1843). After the appearance of Mommsen's *Inscriptiones regni Neapolitani Latinae* (Leipzig, 1852) and his *Inscriptiones confoederationis Helveticae Latinae* (vol. x. of the publications of the Zurich Antiquarian Society, 1854), the publication of the *C.I.L.*, following the similar work of the Greek inscriptions, was undertaken by the Royal Academy of Sciences of Berlin.

This work, in which the previous literature is fully described and utilized, consists of the following parts:—vol. i., *Inscriptiones antiquissimae ad C. Caesaris mortem* (1863; 2nd ed., part i., 1893); Ritschl's *Priscae Latinitatis monumenta epigraphica* (Berlin, 1862, fol.) form the graphic illustration to vol. i., giving all extant monuments of the republican epoch (with five *Supplementa*, Bonn, 1862–1865; R. Garrucci's *Sylloge inscriptionum Latinarum aevi Romanae reipublicae usque ad C. Iulium Caesarem plenissima*, 2 vols., Turin, 1875–1877, must be used with caution); vol. ii., *Inscr. Hispaniae* (1869; with Supplement, 1892); vol. iii., *Inscr. Asiae, provinciarum Europae Graecarum, Illyrici* (1873; with Supplements and Index, 1889–1902); vol. iv., *Inscr. parietariae Pompeianae Herculanenses Stabianae* (the scratched and painted inscriptions chiefly of Pompeii) (1871; with Supplement, part i., 1898; part ii., 1909); vol. v., *Inscr. Galliae cisalpinae* (1872–1877; with Suppl., Et. Pais, *C.I.L. suppl. Italica*); vol. vi., *Inscr. urbis Romae* (1876–1902; with Supplement, 1902); vol. vii., *Inscr. Britanniae* (1873); vol. viii., *Inscr. Africae* (1881; with Supplement, 1891–1894, 1904); vol. ix., *Inscr. Calabriae, Apuliae, Samnii, Sabinorum, Piceni* (1883); vol. x., *Inscr. Bruttiorum, Lucaniae, Campaniae, Siciliae, Sardiniae* (1883); vol. xi., *Inscr. Aemiliae, Umbriae, Etruriae* (1888; part ii., 1901 sqq.); vol. xii., *Inscr. Galliae Narbonensis* (1888); vol. xiii., *Inscr. trium Galliarum et duarum Germaniarum* (1899 sqq.; part ii., 1905 sqq.); vol. xiv., *Inscr. Latii antiqui*; vol. xv., *Inscr. laterum* (1891; part ii., i. [*vasa, lucernae, fistulae*], 1899). The arrangement observed in the *Corpus* is the geographical (as in Apianus); within the single towns the order of subjects (*tituli sacri, magistratuum, privatorum*, &c., as in Smetius) is followed, with some few exceptions, where the monuments are so numerous (as in the *forum* of Rome and at Pompeii and Lambaesis) that they can be assigned to their original places. Running supplements to the *C.I.L.* are given in the *Ephemeris epigraphica, Corporis inscr. Latinarum supplementum* (Berlin, 1872 sqq.); and the new discoveries of each year are recorded in Cagnat's *L'Année épigraphique*.

The inscriptions in the other Italian dialects have been published by Conway, *Italic Dialects* (Cambridge, 1897); cf. vol. ii. of von Planta, *Grammatik der oskisch-umbrischen Dialekte* (Strassburg, 1897). A Corpus of the Etruscan inscriptions was begun in 1893 by Pauli and is now nearly complete. The inscriptions of the Veneti, a N. Italian people of the Illyrian stock, will be found in vol. iii. of Pauli, *Altitalische Forschungen* (Leipzig, 1891). For the Christian inscriptions see De Rossi's *Inscr. Christianae urbis Romae septimo saeculo antiquiores*, vol. i. (Rome, 1857), vol. ii. (1888); the *Inscriptions chrétiennes de la Gaule* of Le Blant (2 vols., Paris, 1857–1865; new edition, 1892); the *Altchristliche Inschriften der Rheinlande* of Kraus (1890); the *Christliche Inschriften der Schweiz vom IV.-IX. Jahrhundert* of Egli (1895); and the *Inscr. Hispaniae Christianae* and *Inscr. Britanniae Christianae* of Hübner (Berlin, 1871, 1876). As splendidly illustrated works on the Latin inscriptions of some districts Alphonse de Boissieu's *Inscriptions antiques de Lyon* (Lyons, 1846–1854), Ch. Robert's *Épigraphie romaine de la Moselle* (Paris, 1875), and J. C. Bruce's *Lapidarium septentrionale* (London and Newcastle, 1875) can be recommended. Besides the above-mentioned Orelli-Henzen collection, G. Wilmanns's *Exempla inscriptionum Latinarum* (2 vols, Berlin, 1873, with copious indexes), and Dessau's *Inscriptiones Latinae selectae* (vol. i., 1892; vol. ii., 1903; ii., 1906) give a general synopsis of the materials. Inscriptions of interest to students of history are collected in Rushforth's *Latin Historical Inscriptions* (Oxford, 1893); Leroux, *Revue des publications épigraphiques relatives à l'antiquité romaine*, records those which bear on antiquities. Of other works may be mentioned Ruggiero, *Dizionario epigrafico di antichità romane* (1886); Olcott, *Thesaurus linguae Latinae epigraphicae* (1904 sqq.).

II. Information regarding the forms of letters used on Roman inscriptions will be found under the articles Latin Language, Palaeography and Writing (cf. Hübner, *Exempla scripturae*

[1] See E. Hübner, *Über mechanische Copieen von Inschriften* (Berlin, 1881).

[2] Compare De Rossi, *Bullettino dell' instituto archeologico* (1871), p. 1 sq.

[3] His works have been published by the French government in several volumes 4to (Paris, 1862 sqq.).

epigraphicae Latinae, 1895). The forms of the single letters vary not inconsiderably according to the material of the monuments, their age and their origin. Carefully cut letters, especially when on a large scale, naturally differ from those scratched or painted on walls by non-professional hands, or hewn on rocks by soldiers; and small incised (or dotted) letters on metal or ivory and bone, and those painted on earthenware, or impressed on it or on glass before burning, are also necessarily of a different character. The letters, ordinarily drawn with *minium* on the monument before being cut (and also often painted, after having been cut, with the same colour), sometimes have been painted with a brush, and thence receive a peculiar form. To save space, on coins first and afterwards in inscriptions also, two or three or even more letters were joined, especially at the end of the lines, to a *nexus* or a *ligatura*. This system of compendious writing, very rare in the republican epoch, and slowly extending itself during the 1st century, became rather frequent in the 2nd and 3rd, especially in Spain and Africa. There is no constant system in these *nexus litterarum*, but generally the rule is observed that no substantial element of a single letter is to be counted for twice (thus *e.g.* ✝ is *it* or *ti*, not *Titi*). Numerals are usually distinguished from letters in the ancient period, down to the end of the republic, by a stroke drawn through them, as in ++VIR, *duo(m) vir(om)* ++S *duo semis* (*sestertius*), ⊖ 500; it was afterwards put above them, as in $\overline{\text{II}}$VIR, XVIR, $\overline{\text{IIIIII}}$VIR, *duovir, decemvir, sevir.*[1]

The direction of the writing is in the very oldest inscriptions from right to left and from left to right in alternate lines, an arrangement technically called βουστροφηδόν (D. Comparetti, *Iscrizione arcaica del Foro Romano*, Florence, 1900; H. Jordan, *Hermes*, vol. xv. p. 5, 1880), and in the Sabellic inscriptions similar arrangements are not infrequent. In all others it is from left to right. Each word is separated from the other by a sign of interpunction, which is not wanted, therefore, at the end of lines or of the whole text. Exceptions to this rule occur only in the later period (from the 2nd century downwards), and sometimes under special conditions, as when abridged words form the end of the line. Here and there even the different syllables of each word are separated by interpunction. The interpunction is formed by a single dot (except in some very ancient inscriptions, such as the recently found Forum inscription of the regal period and those of Pisaurum, where, as in Greek and other Italian monuments, three dots ⋮ are used. According to the technical skill of the different periods in stone-cutting this dot is in some very ancient inscriptions quadrangular, or similar to an oblique cross (×), or oblong (as a bold stroke), but, as a rule, triangular, and never circular. This triangular dot changes, by ornamentation, into a hook (ↄ) or a leaf (❦); the ivy-leaf-shaped dot is especially frequent in inscriptions from about the 2nd century downwards. The dot is always placed at the middle height of the letters, not, as now, at the foot of the line. In large texts of instruments the interpunction is often omitted; in the later period it is often entirely wanting; and in short texts, in the disposition of the lines, in the varying sizes of the letters employed, in the division of words at the end of the lines, &c., certain rules are observed, which cannot be detailed here. In some instances older inscriptions have been cancelled and more recent ones substituted (*e.g.* on milestones), especially in the case of the *damnatio memoriae* (in cases of high treason), in consequence of which the names of consuls and emperors are often cancelled; but in modern times also inscriptions have been deliberately destroyed or lost ones restored.

For understanding the texts of the inscriptions an accurate knowledge of the system of abbreviations used in them is necessary (see Cagnat, *Cours d'épigraphie latine*, 3rd ed., 1898). These are almost invariably *litterae singulares*; that is to say, the initial letter is employed for the entire word (in all its grammatical forms), or if one initial, as belonging to more than one word, is not sufficiently clear, the first two or even the first three letters are employed; rarely more than three. Abbreviations in the true sense of the word (by dropping some letters at the end) are to be found, in the older period, only at the end of lines, and not frequently. In the later period some instances of them have been observed. The *litterae singulares*, as Valerius Probus taught, are either generally employed (*usus generalis*) in all classes of written documents (and so in literature also), as, for instance, those of the individual names (the *praenomina*), the names of days and feasts (*kal.* for *kalendae*), and those of the chief magistrates (*cos.* for *consul*) and the like; or they belong chiefly (but not exclusively) to certain classes of documents, such as those used in juridical acts (*l.* for *lex*, *h.* for *heres*, *s. d. m.* for *sine dolo malo*, and so on), in sepulchral inscriptions (*h. s. e.*, *hic situs est*) or in dedicatory inscriptions (*v. s. l. m.*, *votum solvit libens merito*), &c.[2]

It may be observed here that the *praenomina* are, as a rule, always written in the universally known abbreviations (in the few instances where they are written in full it is a consequence of Greek influence or of peculiar circumstances). The *gentilicia* in *-ius* are abridged, in the republican period, in *-i* (in the nominative, perhaps for *-is*). In the always abbreviated indications of ancestors or patrons (in the case of slaves and freedmen), as *C. f.*, *Gai filius*, *M. l.*, *Marci libertus* (*s.* for *servus* is not frequent), the feminine gender is sometimes indicated by inversion of the letters. Thus Ɔ. *l.* (or *lib.*) or W (an inverted M) *l.* designates a *mulieris libertus*; ꟻ and ꟼ are used for *filia*, *pupilla*. On the *tribus* and their abbreviations, and on the so-called military *tribus* (which are names of colonies collocated, for the sake of symmetry, at the place usually occupied, in the nomenclature, by the *tribus*), and on the other indications of origin used in the designation of individuals, the indexes to the above-named works give sufficient information; on the geographical distribution of the *tribus* see Grotefend's *Imperium Romanum tributim descriptum* (Hanover, 1863). For the abbreviations of official charges, urban and municipal, and, in the imperial period, civil and military (to which, beginning with the 4th century, some Christian designations are to be added), see also the explanations given in the indexes. Among these abbreviations the first instances are to be found of the indication of the plural number by doubling the last letter; thus *Augg.*, *Caess.*, *coss.*, *dd. nn.* (*domini nostri*), are used from the 3rd century downwards (see De Rossi's preface to the *Inscriptiones Christ. urbis Romae*) to distinguish them from *Aug.*, *Caes.*, as designating the singular. In the later period, a dot or a stroke over the abridged word, like that upon numerals, here and there indicates the abbreviation.

III.—1. Among the inscriptions in the stricter sense (the *tituli*), perhaps the oldest, and certainly the most frequent, are the *sepulchral inscriptions* (*tituli sepulcrales*). Of the different forms of Roman tombs, partly depending upon the difference between burial and cremation, which were in use side by side, a very complete account is given in Marquardt's *Handbuch der römischen Altertümer* (vol. vii. part i., Leipzig, 1879, p. 330 seq.). The most ancient examples are those of a *sepulcretum* at Praeneste (*C.I.L.* i. 74, 165, 1501 *a-d*; *Ephem. epigr.* i. 25-131; Wil. 153); the oldest of these contain nothing but the name of the deceased in the nominative; those of more recent date give it in the genitive. The oldest and simplest form remained always in use down to Christian times: it is that used on the large tectonic monuments of the Augustan age (*e.g.* that of Caecilia Metella, *C.I.L.* vi. 1274) and in the *mausolea* of most of the emperors, and is still frequent in the *tituli* of the large *columbaria* of the same age (*C.I.L.* vi. part ii.). It was early succeeded by the lists of names, given also in the nominative, when more than one individual, either dead or alive, were to be indicated as sharers of a tomb. To distinguish the members still alive, a *v* (*vivit, vivos, vivi*) was prefixed to their names (*e.g. C.I.L.* i. 1020, 1195, 1271); the deceased were sometimes marked by the θῆτα *nigrum* (*C.I.L.* i. 1032; Wil. 158; see also *C.I.L.* vi. 10251 seq.). Only the names in the nominative are shown, too, on the *sarcophagi* of the *Turpleii* and *Fourii* at

[1] For other details of numerical notation, fractions, &c., see the manuals of metrology.

[2] On the system of Roman nomenclature and the abbreviations employed in it see Cagnat's textbook, and for more detail Mommsen in *Römische Forschungen*, i. 1 seq., and in *Hermes*, iii. (1869), p. 70, W. Schulze, *Zur Geschichte lateinischen Eigennamen* (Berlin, 1904); on the *cognomina* (but only those occurring in ancient literature), Ellendt, *De cognomine et agnomine Romano* (Königsberg, 1853), and on the local *cognomina* of the Roman patriciate, Mommsen, *Röm. Forsch.* ii. 290 seq.; on the *nomina gentilicia*, Hübner (*Ephem. epigr.* ii. 25 seq.). The indexes to Orelli, Wilmanns, and the volumes of the *Corpus* may also be consulted.

Tusculum (*C.I.L.* i. 65-72; Wil. 152), and in the oldest inscriptions on those of the *Scipiones*, painted with *minium* (*C.I.L.* i. 29; Wil. 537), to which were added afterwards the insignia of the *magistratus curules* (*C.I.L.* i. 31; Wil. 538) and the poetical *elogia*. Of a somewhat different kind are the inscriptions scratched without much care on very simple earthen vessels which belonged to a *sepulcretum* of the lower class, situated outside the *porta Capena* at Rome, on the Appian road, near the old church of San Cesario (*C.I.L.* i. 882-1005, 1539, 1539 *a-d* = *C.I.L.* vi. 8211-8397; Wil. 176); they can be ascribed to the period of the Gracchi. On these *ollae*, besides the name of the deceased, also for the most part in the nominative, but on the more recent in the genitive, the date of a day, probably that of the death, is noted; here and there *obit* (or *o.*) is added. About the same epoch, at the beginning of the 6th century, along with the growing taste for tectonic ornamentation of the tombs in the Greek style, poetical epigrams were added to the simple sepulchral *titulus*, especially amongst the half-Greek middle class rapidly increasing in Rome and Italy; Saturnian (*C.I.L.* i. 1006), iambic (1007–1010) and dactylic (1011) verses become more and more frequent in epitaphs (see Buecheler, *Anthologia Latina*, ii.). In prose also short designations of the mental qualities of the deceased (*homo bonus, misericors, amans pauperum*, or *uxor frugi, bona, pudica* and the like), short dialogues with the passer-by (originally borrowed from Greek poetry), as *vale salve, salvus ire, vale et tu, te rogo praeteriens dicas "sit tibi terra levis,"* &c. (Wil. 180), then indications of his condition in his lifetime, chiefly among the Greek tradesmen and workmen, *e.g. lanius de colle Viminale* (*C.I.L.* i. 1011), *margaritarius de sacra via* (1027) and the like, and some formulae, such as *ossa hic sita sunt, heic cubat, heic situs est* (in republican times mostly written in full, not abridged) were added (J. Church "Zur Phraseologie der lat. Grabinschriften" in *Arch. lat. Lexikogr.* 12. 215 sqq.). The habit of recording the measurement of the sepulchre, on the sepulchral *cippus*, by such formulae as *locus patet in fronte pedes tot, in agro* (or *in via*, or *retro*) *pedes tot*, seems not to be older than the Augustan age (*C.I.L.* i. 1021, with Mommsen's note; Wil. 188). About the same time also the epitaphs more frequently state how long the deceased lived, which was formerly added only on certain occasions (*e.g.* in the case of a premature death), and mostly in poetical form. The worship of the *dei Manes*, though undoubtedly very ancient, is not alluded to in the sepulchral inscriptions themselves until the close of the republic. Here and there, in this period, the tomb is designated as a (*locus*) *deum Maanium* (*e.g.* at Hispellum, *C.I.L.* i. 1410); or, it is said, as on a *cippus* from Corduba in Spain (*C.I.L.* ii. 2255; Wil. 218), *C. Sentio Sat(urnino) co(n)s(ule)*—that is, in the year 19 B.C.—*dei Manes receperunt Abulliam N(umerii) l(ibertam) Nigellam*. In the Augustan age the *titulus sepulcralis* begins to be confounded with the *titulus sacer*; it adopts the form of a dedication *deis Manibus*, offered to the *dei Manes* (or *dei inferi Manes*, the *dei parentum* being the *Manes* of the parents) of the deceased (see Orel. 4351; Wil. 217-228). This formula, afterwards so common, is still very rare at the end of the republic, and is usually written in full, while in later times it is employed, both simply and in many varied forms (as *dis manibus sacrum*, or *d. m. et memoriae, d. m. et genio*, or *memoriae aeternae, paci et quieti, quieti aeternae, somno aeternali* and so on; Wil. 246), in thousands of monuments. By similar degrees the *titulus sepulcralis* adopts many of the elements of the *titulus honorarius* (the indication of the *cursus honorum*, of the military charges, &c., as *e.g.* in the inscription of Cn. Calpurnius Piso, *C.I.L.* i. 598 = vi. 1276, Wil. 1105, on the pyramid of Cestius, *C.I.L.* vi. 1374, and on the monument at Ponte Lucano of Ti. Plautius Silvanus Aelianus, consul A.D. 74, Orel. 750, Wil. 1145 and many others), of the *tituli operum publicorum* (*e.g. monumentum fecit, sibi et suis*, &c.), and of the *instrumenta*. Testaments (like those of Dasumius of the year A.D. 109.—*C.I.L.* vi. 10229; Wil. 314; and T. Flavius Syntrophus—*C.I.L.* vi. 10239; Henz. 7321; Wil. 313), or parts of them (like that on the tomb of a Gaul of the tribe of the Lingones, belonging to Vespasian's time, Wil. 315), funeral orations (as those on Turia—*C.I.L.* vi. 1527; *Notizie degli scavi* (1898), p. 412; Hirschfeld, *Wiener Studien Bormannheft*, p. 283; Fowler, *Classical Review*, xix. 261; on Murdia—*C.I.L.* vi. 10230; Orel. 4860; Rudorff, *Abhandlungen der Königl. Akademie der Wissenschaften zu Berlin* (1868), p. 217 seq.; and that of Hadrian on the elder Matidia, found at Tivoli—Mommsen in the same *Abhandlungen* (1863), p. 483 seq; Dehner, *Laudatio Matidiae*, Neuwied (1891), numerous statements relating to the conservation and the employment of the monuments (*C.I.L.* vi. 10249; Wil. 287-290), to their remaining within the family of the deceased—from which came the frequent formula "*h(oc) m(onumentum) h(eredem) n(on) s(equetur)*" and the like (Wil. 280; cf. Hor. *Sat.* i. 8. 13),—and relating to the annual celebration of *parentalia* (Wil. 305 seq.), down to the not uncommon prohibition of violation or profanation of the monument *noli violare*, &c., with many other particulars (on which the index of Wil. p. 678 seq. may be consulted), form the text of the sepulchral inscriptions of the later epoch from Augustus downwards. The thoroughly pagan sentiment *non fui non sum non curo*, or *n. f. n. s. n. c.*, is common, apparently a translation of the Greek οὐκ ἤμην, ἐγενόμην· οὐκ ἔσομαι· οὐ μέλει μοι. Another type of epitaph, much affected by the poorer classes (like our "Affliction sore" &c.), is: *noli dolere mater eventum meum, Properavit aetas, hoc voluit fatus* (sic) *mihi* ((Lier, "Topica carminum sepulcralium Latinorum" in *Philologus*, 62. 445 sqq.). To these are to be added many local peculiarities of provinces (as Spain and Africa), districts (as the much-disputed *sub ascia dedicare* of the stones of Lyons and other parts of Gaul), and towns, of which a full account cannot be given here.

2. Of the *dedicatory inscriptions* (or *tituli sacri*), the oldest known are the short indications painted (along with representations of winged *genii*, in the latest style of Graeco-Italian vase painting), with white colour on black earthen vessels, by which those vessels (*pocula*) are declared to be destined for the worship, public or private, of a certain divinity (*C.I.L.* i. 43-50; *Ephem. epigr.* i. 5-6; Wil. 2827 *a-i*); they give the name of the god, as that of the possessor, in the genitive (*e.g. Saeturni pocolom, Lavernai pocolom*). The proper form of the dedication, the simple dative of the name of a divinity and often nothing else (as *Apolenei, Fide, Junone*, &c., which are all datives), is shown on the very primitive altars found in a sacred wood near Pisaurum (*C.I.L.* i. 167-180; Wil. 1-14); but also the name of the dedicants (*matrona, matrona Pisaurese*, which are nomin. plur.) and the formulae of the offering (*dono dedrot* or *dedro, donu dat*, where *dono* and *donu* are accus.) are already added to them. This most simple form (the verb in the perfect or in the present) never disappeared entirely; it occurs not infrequently also in the later periods. Nor did the dative alone, without any verb or formula, go entirely out of use (see *C.I.L.* i. 630; Wil. 36; *C.I.L.* i. 814 = vi. 96; Orel. 1850; Wil. 32; *C.I.L.* i. 1153; Henz. 5789; Wil. 1775). But at an early date the verb *donum dare* and some synonyms (like *donum portare, ferre, mancupio dare, parare*) were felt to be insufficient to express the dedicator's good-will and his sense of the justice of the dedication, which accordingly were indicated in the expanded formula *dono dedet lub(e)s mereto* (*C.I.L.* i. 183, cf. p. 555; Wil. 21; *C.I.L.* i. 190; Wil. 22), or, with omission of the verb, *dono mere(to) lib(e)s* (*C.I.L.* i. 182). The dative case and this formula, completely or partially employed (for *merito* alone is also used, as *C.I.L.* i. 562, cf. *Ephem. epigr.* ii. 353, Wil. 29), remained in solemn use. To *lubens* (or *libens*) was added *laetus* (so in Catullus 31. 4), and, if a vow preceded the dedication, *votum solvit* (or *voto condemnatus dedit*; see *C.I.L.* i. 1175; Henz. 5733; Wil. 142, and *C.I.L.* ii. 1044); so, but not before the time of Augustus (see *C.I.L.* i. 1462 = iii. 1772), the solemn formula of the dedicatory inscriptions of the later period, *v. s. l. m.* or *v. s. l. l. m.*, arose. To the same effect, and of equally ancient origin with the solemn words *dare* and *donum dare*, the word *sacrum* (or other forms of it, as *sacra* [*ara*]), conjoined with the name of a divinity in the dative, indicates a gift to it (*e.g. C.I.L.* i. 814; Wil. 32; *C.I.L.* i. 1200-1201; Wil. 33 *a b*); the same form is to be found also in the later period (*e.g. C.I.L.* i. 1124; Henz. 5624-5637), and gave the model for the numerous sepulchral inscriptions with *dis Manibus sacrum* mentioned before. *Sacrum* combined with a genitive very seldom occurs (Orel. 1824; Wil. 34); *ara* is found more frequently (as *ara Neptuni* and *ara Ventorum*, Orel. 1340). Dedications were frequently the results of vows; so victorious soldiers (such as L. Mummius, the conqueror of Corinth—*C.I.L.* i. 541 seq.; Orel. 563; Wil. 27), and prosperous merchants (*e.g.* the brothers Vertuleii—*C.I.L.* i. 1175; Henz. 5733; Wil. 142) vow a tenth part of their booty (*de praedad*, as is said on the basis erected by one of the Fourii of Tusculum—*C.I.L.* i. 63, 64; Henz. 5674; Wil. 18) or gain, and out of this dedicate a gift to Hercules or other divinities (see also *C.I.L.* i. 1503; Wil. 24; *C.I.L.* 1113; Wil. 43). Again, what one man had vowed, and had begun to erect, is, by his will, executed after his death by others (as the *propylum Cereris et Proserpinae* on the Eleusinian temple, which Appius Claudius Pulcher, Cicero's well-known predecessor in the Cilician proconsulate, began—*C.I.L.* i. 619 = iii. 347; Wil. 31); or the statue that an *aedilis* vowed is erected by himself as *duovir* (*C.I.L.* iii. 500; Henz. 5684); what slaves had promised they fulfil as freedmen (*C.I.L.* 1233, *servos vovit liber solvit*; *C.I.L.* 816, Wil. 51, "*ser(vos) vov(it) leibert(us) solv(it)*"), and so on. The different acts into which an offering, according to the circumstantially detailed Roman ritual, is to be divided (the *consecratio* being fulfilled only by the solemn *dedicatio*) are also specified on dedicatory inscriptions (see for instance, *consacrare* or *consecrare*, Orel. 2503, and Henz. 6124, 6128; for *dedicare*, *C.I.L.* i. 1159, Henz. 7024, Wil. 1782, and compare Catullus's *hunc lucum tibi dedico consecroque Priape*; for *dicare* see the *aara leege Albana dicata* to Vediovis by the *genteiles Iuliei*, *C.I.L.* i. 807, Orel. 1287, Wil. 101). Not exactly dedicatory, but only mentioning the origin of the gift, are the inscriptions on the pedestals of offerings (ἀναθήματα, *donaria*) out of the booty, like those of M. Claudius Marcellus from Enna (*C.I.L.* i. 530; Wil. 25, "*Hinnad cepit*") or of M. Fulvius Nobilior, the friend of the poet Ennius, from Aetolia (*C.I.L.* i. 534; Orel. 562; Wil. 26 *a*, and *Bullettino dell'Instituto*, 1869, p. 8; *C.I.L.* vi. 1307; Wil. 26 *b*, "*Aetolia cepit*" and "*Ambracia cepit*"); they contain only the name of the dedicator, not that of the divinity. Of the similar offerings of L. Mummius, already mentioned, two only are preserved in their original poetical form, the Roman in Saturnian verses of a *carmen triumphale* (*C.I.L.* i. 541; Orel. 563; Wil. 27 *a*) and that found at Reate in dactylic hexameters (*C.I.L.* i. 542; Wil. 27 *b*); the rest of them contain only the name of the dedicant and the dative of the community to which they were destined (*C.I.L.* i. and Wil. *l.c.*). Of a peculiar form is the very ancient inscription on a bronze tablet, now at Munich, probably from Rome, where two *aidiles*, whose names are given at the beginning as in the other *donaria*, "*vicesma(m) parti(m)* or [*ex*] *vicesma*

parti Apolones (that is, *Apollinis*) *dederi* (that is, *dedere*) " (*C.I.L.* i. 187; Orel. 1433). Many, but not substantial, varieties arise, when old offerings are restored (*e.g. C.I.L.* i. 638, 632 = Orel. 2135, and Wil. 48; *C.I.L.* i. 803; Henz. 5669, 6122); or the source of the offering (*e.g. de stipe, C.I.L.* i. 1105; Henz. 5633 *a*; *ex reditu pecuniae, ex patrimonio suo, ex ludis, de munere gladiatorio*, and so on); or the motive (*ex jusso, ex imperio, ex visu, ex oraculo, monitu, viso moniti, somnio admonitus* and the like), or the person or object, for which the offering was made (*C.I.L.* i. 188, *pro poplod; Ephem. epigr.* ii. 208, *pro trebibos*, in the British Museum; *pro se, pro salute, in honorem domus divinae*, &c.), are indicated; or, as in the *tituli operum publicorum*, the order of a magistrate (*de senati sententia*, *C.I.L.* i. 560 = vi. 1306; Orel. 5351; i. 632 = vi. 110; Orel. 2135; Wil. 48; *decurionum decreto*, &c.), and the magistrates or private persons executing or controlling the work, the place where and the time when it was erected, are added. On all these details the indexes, especially that of Wil. (ii. 675), give further information. The objects themselves which are offered or erected begin to be named only in the later period just as in the *tituli operum publicorum* ("*basim donum dant*," *C.I.L.* i. 1167; "*signum basim*," *C.I.L.* i. 1154; "*aram*," *C.I.L.* i. 1468; Orel. 1466; Wil. 52; *C.I.L.* i. 1109; Wil. 54); in the later period this custom becomes more frequent. It is hardly necessary to observe that all kinds of offerings have very frequently also been adorned with poetry; these *carmina dedicatoria* are given by Buecheler, *Anthologia Latina*, ii.; cf. Wil. 142-151.

3. Statues to mortals, whether living or after their death (but not on their tombs), with *honorary inscriptions* (*tituli honorarii*), were introduced into the Roman republic after the Greek model and only at a comparatively late date. One of the oldest inscriptions of this class comes from Greek soil and is itself Greek in form, with the name in the accusative governed by some (suppressed) verb like "honoured" (*C.I.L.* i. 533; Wil. 649), "*Italicei L. Cornelium Scipionem* (*i.e. Asiagenum*) *honoris caussa*," lost and of not quite certain reading, belonging to 561 A.U.C. (193 B.C.); the same form (in the accusative) appears in other (Latin or Latin and Greek) inscriptions from Greece (*C.I.L.* i. 596 = iii. 532; Wil. 1103; *C.I.L.* iii. 365, 7240; compare also *C.I.L.* i. 587, 588; Orel. 3036). The noble house of the Scipios introduced the use of poetical *elogia* in the ancient form of the *carmina triumphalia* in Saturnian verses (from the 6th century in elegiac distichs). They were added to the short *tituli*, painted only with *minium* on the sarcophagi, giving the name of the deceased (in the nominative) and his curulian offices (exclusively), which were copied perhaps from the well-known *imagines* preserved in the *atrium* of the house (*C.I.L.* i. 29 sq.; Orel. 550 sq.; Wil. 537 sq., and elsewhere). They hold, by their contents, an intermediate place between the sepulchral inscriptions, to which they belong properly, and the honorary ones, and therefore are rightly styled *elogia*. What the Scipios did thus privately for themselves was in other cases done publicly at a period nearly as early. The first instance preserved of such a usage, of which Pliny the elder speaks (*Hist. nat.* xxxiv. § 17 sq.), is the celebrated *columna rostrata* of C. Duilius, of which only a copy exists, made in or before the time of the emperor Claudius (*C.I.L.* i. 195 = vi. 1300; Orel. 549; Wil. 609). Then follow the *elogia* inscribed at the base of public works like the *Arcus Fabianus* (*C.I.L.* i. 606, 607 and 278, elog. i.-iii. = vi. 1303, 1304; Wil. 610), or of statues by their descendants, as those belonging to a *sacrarium domus Augustae* (*C.I.L.* i. elog. iv.-vi. = *C.I.L.* vi. 1310, 1311) and others belonging to men celebrated in politics or in letters, as Scipio, Hortensius, Cicero, &c., and found in Rome either on marble tablets (*C.I.L.* i. vii.-xii. = *C.I.L.* vi. 1312, 1279, 1283, 1271, 1273; Wil. 611-613) or on busts (*C.I.L.* i. xv.-xix. = *C.I.L.* vi. 1327, 1295, 1320, 1309, 1325, 1326; Wil. 618-621; see also *C.I.L.* i. 40 = vi. 1280; Wil. 1101; and *C.I.L.* i. 631 = vi. 1278; i. 640 = vi. 1323, vi. 1321, 1322, where *T. Quincti* seems to be the nominative), and in divers other places (*C.I.L.* i. xiii., xiv.; Wil. 614, 615). This custom seems to have been resumed by Augustus (Suet. *Aug.* 31) with a political and patriotic aim, praised by the poet Horace (*Od.* iv. 8. 13, "*incisa notis marmora publicis, per quae spiritus et vita redit bonis post mortem ducibus*"); for he adorned his *forum* with the statues of celebrated men from Aeneas and Romulus downwards (*C.I.L.* i. xxiv., xxv., xxvii., xxxii. = *C.I.L.* vi. 1272, 1308, 1315, 1318; Wil. 625, 626, 627, 632), and other towns followed his example (so Pompeii, *C.I.L.* i. xx., xxii. = Wil. 622, 623; Lavinium, *C.I.L.* i. xxi.; Wil. 617; Arretium, *C.I.L.* i. xxiii., xxviii., xxix., xxx., xxxi., xxxiii., xxxiv. = Wil. 624, 625, 629-633). All these *elogia* are written in the nominative. In the same way in the colonies statues seem to have been erected to their founders or other eminent men, as in Aquileia (*C.I.L.* i. 538 = v. 873; Wil. 650; compare also *C.I.L.* v. 862; Orel. 3827) and Luna (*C.I.L.* i. 539 = Wil. 651).

But along with this primitive and genuine form of the *titulus honorarius* another form of it, equivalent to the dedicatory inscription, with the name of the person honoured in the dative, begins to prevail from the age of Sulla onwards. For the oldest examples of this form seem to be the inscriptions on statues dedicated to the dictator at Rome (*C.I.L.* i. 584 = vi. 1297; Orel. 567; Wil. 1102*a*) and at other places (Caieta and Clusium, *C.I.L.* i. 585, 586; Wil. 1102*b*, *c*), in which the whole set of honours and offices is not enumerated as in the *elogia*, but only the *honores praesentes*; compare also the inscription belonging to about the same date, of a *quaestor urbanus* (*C.I.L.* i. 636). Within the Greek provinces also, at the same period, this form is adopted (*C.I.L.* i. 595 = iii. 531; Henz. 5294; Wil. 1104). Similar dedications were offered to Pompey the Great (at Auximum and Clusium, *C.I.L.* i. 615, 616; Orel. 574; Wil. 1107) and to his legate L. Afranius (at Bologna, but erected by the citizens of the Spanish colony Valentia, *C.I.L.* i. 601; Henz. 5127; Wil. 1106). They are succeeded by the statues raised to Caesar (at Bovianum, *C.I.L.* i. 620; Orel. 582; Wil. 1108), and, after his death, *iussu populi Romani*, in virtue of a special law, at Rome (*C.I.L.* i. 626 = vi. 872; Orel. 586; Wil. 877). With him, as is well known, divine honours begin to be paid to the *princeps*, even during life. In this same form other historical persons of high merit also begin to be honoured by posterity, as, for example, Scipio the elder at Saguntum (*C.I.L.* ii. 3836; Wil. 653), Marius at Cereatae Marianae, the place which bears his name (*C.I.L.* x. 5782; Wil. 654). Of statues erected by the community of a municipium to a private person, that of L. Popillius Flaccus at Ferentinum seems to be the oldest example (*C.I.L.* i. 1164; Wil. 655, and his note). In Rome, Augustus and his successors in this way permitted the erection of statues, especially to *triumphatores*, in the new *fora*, including that of Augustus (*C.I.L.* vi. 1386; Orel. 3187; Wil. 634; *C.I.L.* vi. 1444; Henz. 5448; Wil. 635) and that of Trajan (*C.I.L.* vi. 1377; Henz. 5478; Wil. 636; vi. 1549; Henz. 5477; Wil. 639; iv. 1549; Orel. 1386; Wil. 637; *C.I.L.* 1565, 1566; Wil. 640); and this custom lasted to a late period (*C.I.L.* vi. 1599; Henz. 3574; Wil. 638), as is shown by the statues of Symmachus the orator (*C.I.L.* vi. 1698, 1699; Orel. 1186, 1187; Wil. 641), Claudian the poet (*C.I.L.* vi. 1710; Orel. 1182; Wil. 642), Nicomachus Flavianus (*C.I.L.* vi. 1782, 1783; Orel. 1188; Henz. 5593; Wil. 645, 645*a*), and many other eminent men down to Stilicho (*C.I.L.* vi. 1730, 1731; Orel. 1133, 1134; Wil. 648, 648*a*), who died in the year 408. In similar forms are conceived the exceedingly numerous dedications to the emperors and their families, in which the names and titles, according to the different historical periods, are exhibited, in the main with the greatest regularity. They are specified in detailed indexes by Henzen and Wilmanns, as well as in each volume of the *Corpus*. In the provinces, of course, the usages of the capital were speedily imitated. Perhaps the oldest example of a *titulus honorarius* in the form of an *elogium* (but in the dative), with the full *cursus honorum* of the person honoured, is a *bilinguis* from Athens, of the Augustan age (*C.I.L.* iii. 551; Henz. 6456 *a*; Wil. 1122); the honours are here enumerated in chronological order, beginning with the lowest; in other instances the highest is placed first, and the others follow in order.[1] In the older examples the formula "*honoris causa*," or *virtutis ergo* (*Hermes*, vi., 1871, p. 6), is added at the end, as in an inscription of Mytilene belonging to the consul of the year 723 A.U.C., *i.e.* 31 B.C. (*C.I.L.* iii. 455; Orel. 4111; Wil. 1104 *b*); the same, abbreviated (*h.c.*), occurs on an inscription of about the same age from Cirta in Africa (*C.I.L.* viii. 7099; Wil. 2384). Shortly afterwards the honour of a statue became as common in the Roman *municipia* as it was in Athens and other Greek cities in the later period. Each province furnishes numerous examples, partly with peculiar formulae, on which the indexes of Wilmanns (pp. 673, 696 sq.) may be consulted. Special mention may be made of the numerous honorary inscriptions belonging to *aurigae*, *histriones* and *gladiatores*; for those found in Rome see *C.I.L.* vi. 10,044-10,210.

He who erects a temple or a public building, or constructs a road, a bridge, an aqueduct or the like, by inscribing his name on the work, honours himself, and, as permission to do so has to be given by the public authorities, is also honoured by the community. Therefore the *tituli operum publicorum*, though in form only short official statements (at least in the older period) of the origin of the work, without any further indications as to its character and purpose, partake of the style of the older honorary inscriptions. Of the ancient and almost universally employed method of erecting public buildings by means of the *locatio censoria* one monument has preserved some traces (*Ephem. epigr.* ii. 199). The oldest instance of this class is that commemorating the restoration of the temple of the Capitoline Jupiter, begun, after its destruction by fire in the year 671 (83 B.C.), by Sulla and continued five years later by the well-known orator and poet Q. Lutatius Catulus, but completed only about twenty years afterwards. Here, after the name of Catulus in the nominative and the indication of the single parts of the building (as, for example, *substructionem et tabularium*), follows the solemn formula *de s(enati) s(ententia) faciundum coeravit eidemque probavit* (*C.I.L.* i. 592 = vi. 1314; Orel. 31, 3267; Wil. 700). With the same formula the praetor Calpurnius Piso Frugi (of about the same period) dedicated an unknown building (*C.I.L.* i. 594 = vi. 1275), restored afterwards by Trajan. On a work executed by the *collegium tribunorum plebis* (*C.I.L.* i. 593 = vi. 1299; Wil. 787), perhaps the public streets within the town, the sum employed for it is also inscribed. Precisely similar is the oldest inscription of one of the bridges of Rome, the *ponte dei quattro capi*, still preserved, though partly restored, on its original site, which commemorates its builder, the tribune of the year 692

[1] This observation, applied to a large number of monuments, gave rise to many of the splendid epigraphical labours of Borghesi (see *e.g.* his dissertation upon the inscription of the consul L. Burbuleius, *Œuvres*, iv. 103 sq.).

(62 B.C.), L. Fabricius (*C.I.L.* i. 600=vi. 1305; Orel. 50; Wil. 788); it was restored by the consuls of the year 733 (21 B.C.).[1] On privately erected buildings the founder after his name puts a simple *fecit* (as also on sepulchral inscriptions); so, possibly, did Pompey, when he dedicated his theatre as a temple of Venus Victrix and, on Cicero's clever advice, as Varro and Tiro had it from Cicero himself, inscribed on it COS·TERT (not *tertium* or *tertio*) (see Gellius, *Noct. Att.* x. 1). So Agrippa, when he dedicated his Pantheon in the year 727 (27 B.C.), inscribed on it only the words *M. Agrippa, L. f. cos. tertium fecit* (*C. I.L.* vi. 896; Orel. 34; Wil. 731), as all who visit the Eternal City know. Of municipal examples it will be sufficient to name those of the majestic temple of Cora (*C.I.L.* i. 1149-1150; Wil. 722, 723), of Ferentinum, with the measurements of the foundation (*C.I.L.* i. 1161-1163; Wil. 708), of the walls and towers at Aeclanum (*C.I.L.* i. 1230; Orel. 566; Henz. 6583; Wil. 699), of the theatre, amphitheatre, baths and other structures at Pompeii (*C.I.L.* i. 1246, 1247, 1251, 1252; Orel. 2416, 3294; Henz. 6153; Will. 730, 1899-1901). At Aletrium a munificent citizen gives an enumeration of a number of works executed by him in the period of the Gracchi, in his native town (" *haec quae infera scripta sunt de senatu sententia facienda coiravit*," *C.I.L.* i. 1166; Orel. 3892; Wil. 706); and, more than a century later, the same is done at Cartima, a small Spanish town near Malaga, by a rich woman (*C.I.L.* ii. 1956; Wil. 746). Military works, executed by soldiers, especially frequent in the Danubian provinces, Africa, Germany and Britain, give, in this way, manifold and circumstantial information as to the military administration of the Romans. On a column found near the bridge over the Minho at Aquae Flaviae, the modern Chaves in northern Portugal, ten communities inscribed their names, probably as contributors to the work, with those of the emperors (Vespasian and his sons), the imperial legate of the province, the legate of the legion stationed in Spain, the imperial *procurator*, and the name of the legion itself (*C.I.L.* ii. 2477; Wil. 803); and similarly, with the name of Trajan, on the famous bridge over the Tagus at Alcántara, in Spanish Estremadura, the names of the *municipia provinciae Lusitaniae stipe conlata quae opus pontis perfecerunt* are inscribed (*C.I.L.* ii. 759-762; Orel. 161, 162; Wil. 804).

As in some of the already-mentioned inscriptions of public works the measurements of the work to which they refer (especially, as may be supposed, in the case of works of great extent, such as walls of towns or lines of fortification, like the walls of Hadrian and Antoninus Pius in Britain) are indicated, so it early became a custom in the Roman republic to note on *milestones* the name of the founder of the road and, especially at the extremities of it and near large towns, the distances. So in the *val di Diana* in Lucania P. Popillius Laenas, the consul of the year 622 (132 B.C.), at the end of a road built by him, set up the *miliarium Popilianum* (*C.I.L.* i. 551; Orel. 3308; Wil. 797), which is a general *elogium* to himself, in which he speaks in the first person (*viam fecei ab Regio ad Capuam*, &c.). One of the single *miliaria* set up by him is also preserved (*C.I.L.* i. 550; Henz. 7174 *d*; Wil. 808), which contains only his name and the number of miles. In the same brief style are conceived the other not very frequent republican *miliaria* found in Italy (*C.I.L.* i. 535-537; Henz. 5348; Wil. 567; *C.I.L.* i. 540; Henz. 5350, 6226; Wil. 807; *C.I.L.* i. 558, 559; Henz. 5353; Wil. 808; *C.I.L.* i. 561; Henz. 5180; Wil. 811; *C.I.L.* i. 633; Wil. 812) down to the time of Augustus (*C.I.L.* x. 6895, 6897, 6899; Wil. 813), and also the even more rare specimens from the provinces (from Asia —*C.I.L.* i. 557=iii. 479, Wil. 826, *C.I.L.* i. 622=iii. 462, Wil. 827; from Spain—*C.I.L.* i. 1484-1486=ii. 4920-4925, 4956, Wil. 828, 829). Augustus inscribed on each milestone on his road across Spain " *a Baete et Jano Augusto ad Oceanum* " (*e.g. C.I.L.* ii. 4701; Wil. 832), Claudius on those of a road in Upper Italy founded by his father Drusus "*viam Claudiam Augustam quam Drusus pater Alpibus bello patefactis derexserat munit ab Altino* (or *a flumine Pado*) *ad flumen Danuvium* " (*C.I.L.* v. 8002, 8003; Orel. 648, 708; Henz. 5400; Wil. 818). The later milestones vary greatly in form, but all contain most precious materials for ancient geography and topography; in the volumes of the *Corpus* they are taken together under the special head *viae publicae* (and here and there *privatae*) at the end of each chapter.

A similar character, resulting from the combination of a mere authentic record with the peculiar form of the honorary inscription, belongs to the kindred classes of *inscriptions of the aqueducts* and of the different *boundary-stones.* The large dedicatory inscriptions of the celebrated aqueducts[2] of Rome (as the Aquae Marcia, Tepula and Julia, *C.I.L.* vi. 1244-1246, Orel. 51-53, Wil. 765; the Virgo, *C.I.L.* vi. 1252, Orel. 703, Wil. 763; the Claudia, &c., *C.I.L.* vi. 1256-1258, Orel. 54-56, Wil. 764) have quite the character of honorary inscriptions, while the various *cippi terminales*, which mark the ground belonging to the aqueduct, show the greatest analogy to the milestones (*e.g. C.I.L.* vi. 1243 *a-g*; Henz. 6635, 6636; Wil. 775-779). The other Italian and provincial varieties cannot be specified here. Of boundary-stones, or *cippi terminales*, some very ancient specimens have been preserved. To the age preceding the Second Punic War belong two, found at Venusia and erected by municipal magistrates (*C.I.L.* i. 185, 186; Orel. 3527, 3528; Wil. 863); they give a short relation of a decree, by which certain localities were declared to be sacred or public (" *aut sacrom aut poublicom locom ese* "). Then follow the *cippi Gracchani*, by which Gaius Gracchus and his two colleagues, as *tres viri agris iudicandis adsignandis*, measured the *ager Campanus*, for its division among the plebs. They contain the names of the *tres viri* in the nominative, and in addition, on the top, the lines and angles of the *cardo* and *decumanus*, according to the rules of the *agrimensores*, or the boundary lines between the *ager publicus* and *privatus* (*C.I.L.* i. 552-556; Henz. 6464; Wil. 859-861). From the age of Sulla we still have various boundary-stones giving the line of demarcation between different communities (between Fanum and Pisaurum—*C.I.L.* i. 583, Orel. 570, Wil. 861; between Ateste, Vicetia and Patavium—*C.I.L.* i. 547-549, Orel. 3110, Henz. 5114, 5115, Wil. 865, 866). To the town of Rome belong the *termini ripae Tiberis* (*C.I.L.* i. 608-614=vi. 1234 *a-l*), beginning in the Augustan age, and the *termini* of the *pomoerium* of Claudius and Vespasian as censors, and of the *collegium augurum* under Hadrian (*C.I.L.* vi. 1231-1233; Orel. 710, 811; Wil. 843, 844), while others, of the consuls of the year A.D. 4 (*C.I.L.* vi. 1263; Orel. 3260; Wil. 856), of Augustus (*C.I.L.* vi. 1265; Henz. 6455; Wil. 852), &c., show the boundary between the *ager publicus* and *privatus.* With similar objects boundary-stones were erected by the emperors, or, under their authority, by magistrates, mostly military, in the rest of Italy also (as in Capua—*C.I.L.* x. 3825, Orel. 3683, Wil. 858; at Pompeii—*C.I.L.* x. 1018, Wil. 864) and in the provinces (as in Syria—*C.I.L.* iii. 183; and Macedonia—*C.I.L.* iii. 594; in Dalmatia —*C.I.L.* iii. 2883; in Africa—*C.I.L.* viii. 7084-7090, 8211, 8268, 10,803, 10,838, Wil. 869, 870; in Spain—*C.I.L.* ii. 2349, 2916, Wil. 871—where the *pratum* of a legion is divided from the territory of a *municipium*; in Gaul—Wil. 867; in Germany, in the column found at Miltenberg on the Main, *Bonner Jahrbücher*, vol. lxiv., 1878, p. 46, &c.). Private grounds (*pedaturae*) were unfrequently marked off by terminal *cippi.* To this class of *tituli* must be added also the curious inscriptions incised upon the steps of Roman circuses, theatres and amphitheatres (see Hübner, *Annali dell' Instituto archeologico*, vol. xxviii., 1856, p. 52 sq., and vol. xxxi., 1859, p. 122 sq.), as, for instance, upon those of the Coliseo at Rome (*C.I.L.* vi., 1796, 1-37; compare R. Lanciani, *Bullettino archeologico municipale*, 1881).

4. We now come to the last class of *tituli*, viz. those which in the *Corpus* are arranged, at the end of each volume, under the head of *Instrumentum.* By this very comprehensive term are designated objects which vary greatly among themselves, but which are of such a character as not to fall within any of the classes of *tituli* described before, or the class of the *instrumenta* in the proper sense of that word, —the laws, &c. The *tituli* of the *instrumentum* embrace movable objects, destined for public and private use, and illustrate almost every side of the life of the ancient Romans. As systematic treatment of them is hardly possible, a simple enumeration only of their different classes can be given, without citing special examples. The first species of them is metrological, comprehending the inscriptions on measures and weights. The gold and silver plate used in the best Roman houses was also always marked with a note of its weight,— as is seen, for instance, on the different objects belonging to the Hildesheim find (see *Hermes*, iii., 1868, p. 469 sq.; *Philologus*, xxviii., 1869, p. 369), the Corbridge *lanx* in Northumberland House (*C.I.L.* vii. 1268) and many others. A second species is formed by the *tesserae*, tokens or marks, mostly in bronze, bone and ivory, but also earthen, of which the most interesting are the so-called *tesserae gladiatoriae*, little staves of bone with holes at the top, and with names of slaves or freedmen and consular dates upon them, the relation of which to the *munera gladiatoria* is by no means certain (see *C.I.L.* i. 717 sq., and *Hermes*, xxi. p. 266; *Rhein. Mus.* xli. p. 517; xlii. p. 122; *Berl. phil. Woch.*, 1888, p. 24). The other circular *tesserae* (the so-called *tesserae theatrales*) of ivory or bone, with emblems and short inscriptions, partly Greek and Latin, used to be attributed to the *ludi scaenici* (see Henzen, *Annali dell' Instituto archeologico*, vol. xx., 1848, p. 273 sq., and vol. xxii., 1850, p. 357 sq.) and to other *ludi*; but this account has been questioned (Huelsen, *Bullett. dell' Instituto*, 1896, p. 227). A third species is that of inscriptions carved, inscribed, painted or stamped upon various materials, raw or manufactured, for trade or household use. Such are, to begin with, the most solid and heavy, the inscriptions carved or painted on masses of stone, mostly columns, in the quarries, and preserved either on the rocks themselves in the quarries or on the roughly hewn blocks transported to the Roman *emporium* on the Tiber bank. Curious specimens of the first kind are preserved in Lebanon, and in the north of England, near Hadrian's Wall and elsewhere; on the second may be consulted a learned treatise by Padre L. Bruzza (" Iscrizioni dei marmi grezzi," in the *Annali dell'Instituto archeologico*, vol. xlii., 1870, pp. 106-204). Of a kindred

[1] The character of an *elogium* is assumed in a special way by the inscriptions on triumphal arches, such as that of Augustus on the arch of Susa in Piedmont, dating from the year 745 (9 B.C.) (*C.I.L.* v. 7231; Orel. 626), and the similar one on the *tropaea Augusti* (*la Turbia*) (*C.I.L.* v. 7817) of the year 747 (7 B.C.), which Pliny also (*Hist. Nat.* iii. § 136) records, and those of the other emperors at Rome, of which only that of Claudius, the conqueror of Britain (*C.I.L.* vi. 920, 921; Orel. 715; Wil. 899), with the statues of himself and his family, need be mentioned.

[2] See the important work of R. Lanciani, *Commentari di Frontino intorno le acque e gli acquedotti, &c.* (Rome, 1880).

character are the inscriptions, mostly stamped or engraved in the mould, of pigs of silver, bronze and lead (and pewter), found in the Roman mines in Spain and England (see Hübner, "Römische Bleigruben in Britannien," in *Rheinisches Museum für Philologie*, vol. xi., 1857, p. 347 sq., and *C.I.L.* vii. 220 sq.; A. Way, *Archaeological Journal*, vol. xvi., 1859, p. 23, and vol. xxiii., 1866, p. 63). A fourth species of *tituli* of this class is strictly related to the military institutions of the Roman empire. Many of the weapons are marked with the names of the bearer and of the military corps to which he belonged,—so, for example, the buckles of their shields (see Hübner, "Römische Schildbuckel," in *Archäologisch-epigraphische Mitteilungen aus Österreich*, vol. ii., 1878, p. 105 sq.; by far the best extant specimen is the umbo of a legionary soldier of the eighth legion found in the Tyne near South Shields, *C.I.L.* vii. 495), and sometimes the swords, as that of Tiberius from Mainz (now in the British Museum, see *Bonner Winckelmannsprogramm* of 1848). The leaden *glandes* used by the *funditores*, the slingers, in the Roman army bear curious historical inscriptions (see *C.I.L.* i. 642 sq., *Ephem. epigr.* vi. and, on the question of the authenticity of many of them, Zangemeister, *C.I.L.* ix., 35* sqq.). Special mention must be made also of the leaden seals or marks (*bullae*), evidently of military origin (perhaps to be borne by the soldiers as a countersign), which have been found in many parts of England (*C.I.L.* vii. 1269; *Ephem. epigr.* iii. 144, 318, iv. 209, vii. 346). Of the highest interest are the manifold productions of the Roman tile and brick kilns (*C.I.L.* xv. *Inscriptiones laterum*; cf. Descemet in the *Bibliothèque des écoles françaises*, vol. xv.). Next to the tiles with consular dates made at Veleia (*C.I.L.* i. 777 sqq.), those signed with the name of legions or other military corps, and employed in the various military buildings of these, are especially worthy of mention; they form an important chapter in every geographical part of the *Corpus*. But private persons, too, especially the rich landed proprietors, and afterwards the emperors and their kinsmen, kept large *figulinae*, and their manufactures—tiles of every description and other earthenware—were spread over the Roman empire (Dressel, *Untersuchungen über die Chronologie der Ziegelstempel der Gens Domitia*, 1888; *C.I.L.* xv.). The different sorts of earthen vessels and lamps, the fragments of which are found in great quantities wherever Roman settlements occurred, are arranged at the end of each volume of the *Corpus* and are collected in vol. xv. part ii. p. i. On the maker's marks on earthenware, see Habert, *La Poterie antique parlante* (1893); Dragendorf, "Terra Sigillata," in *Bonn. Jahrbüch.* xcvi. 18. On Roman lamps and their inscriptions the accurate catalogue of the Vienna collection by Kenner ("Die antiken Thonlampen des K. K. Münz- und Antiken-Cabinetes und der K. K. Ambraser Sammlung," in the *Archiv für Kunde österreichischer Geschichtsquellen*, vol. xx., Vienna, 1858) may be consulted with advantage. The chief deposit of earthenware fragments, the *Monte testaccio* in Rome, has been explored by Dressel ("Ricerche sul Monte testaccio," in the *Annali dell' Instituto archeologico*, vol. i., 1878, p. 118-192). Inscriptions are found on various classes of vessels, painted (as the consular dates on the large *dolia* for wine, oil, &c., see Schöne, *C.I.L.* iv. 171 sq., and *Ephem. epigr.* i. 160 sq.), stamped on the clay when still wet or in the mould, and scratched in the clay when dry, like those on the walls of ancient buildings in Pompeii, Rome and other places of antiquity. Like the corresponding Greek ware, they contain chiefly names of the makers or the merchants or the owners, and can be treated in a satisfactory manner only when brought together in one large collection (*C.I.L.* xv. part ii.), inasmuch as, besides being made in many local potteries, they were exported principally from some places in Italy (*e.g.* Arezzo) and Spain, in nearly every direction throughout northern and western Europe, the countries outside the Roman frontiers not excluded. Vessels and utensils of glass and of metal (gold, silver and especially bronze) were also exported from Italy on a large scale, as is being more and more readily recognized even by those antiquaries who formerly were wont to assume a local origin for all bronze finds made in the north of Europe. These utensils, ornaments and other objects made of precious metals (such as cups, spoons, mirrors, *fibulae*, rings, gems), not unfrequently bear Latin inscriptions. On the very ancient silver and bronze caskets, for holding valuable articles of the female toilet, which have been found at Praeneste, are inscribed, in addition to the names of the artist and of the donor, occurring once, the names of the persons in the mythical representations engraved upon them (*C.I.L.* i. 54-60, 1500, 1501; Jordan, *Kritische Beiträge zur Geschichte der lateinischen Sprache*, Berlin, 1879, p. 3 sq.). In the ancient well of the *Aquae Apollinares*, near Vicarello in Tuscany, three silver cups have been found with circumstantial itineraries "*a Gades* (sic) *usque Romam*" engraved upon them, evidently gifts to the divinity of the bath for recovered health presented by travellers from the remote city named (Henzen 5210). Similar is the Rudge Cup, found in Wiltshire and preserved at Alnwick Castle, which contains, engraved in bronze, an itinerary along some Roman stations in the north of England (*C.I.L.* vii. 1291). The inscriptions of the Hildesheim silver find and others of a similar character have been already mentioned; and many examples might be enumerated besides. On the ancient glass ware and the inscriptions on it the splendid works of Deville (*Histoire de l'art de la verrerie dans l'antiquité*, Paris, 1873) and Froehner (*La Verrerie antique, description de la collection Charvet*, Paris, 1879) may be consulted; on the Christian glasses that of Garrucci (*Vetri ornati di figure in oro trovati nei cimiteri dei cristiani primitivi di Roma*, Rome, 1858); on the makers' marks on bronze objects, Mowat, *Marques de bronziers sur objets trouvés ou rapportés en France* (1884) (extracted from *Bulletin épigraphique*, 1883–1884). The last species of *tituli* is formed by the stamps themselves with which the inscriptions on many of the objects already named are produced. They are mostly of bronze, and contain names; but it is not easy to say what sort of objects were marked with them, as scarcely any article stamped with a still existing stamp has been found. Amongst the materials stamped leather also is to be mentioned. One class only of stamps differs widely from the rest,—the oculists' stamps, engraved mostly on steatite (or similar stones), and containing remedies against diseases of the eyes, to be stamped on the glass bowls in which such remedies were sold, or on the medicaments themselves (see Grotefend, *Die Stempel der römischen Augenärzte gesammelt und erklärt* (Göttingen, 1867); de Villefosse and Thédenat, *Cachets d'oculistes romains* (1882); Espérandieu, *Recueil des cachets d'oculistes romains* (1894).

IV. The other great class of inscriptions above referred to, the *instrumenta* or *leges*, the laws, deeds, &c., preserved generally on metal and stone, from the nature of the case have to be considered chiefly with regard to their contents; their form is not regulated by such constant rules as that of the *tituli*, so far as may be inferred from the state of completeness in which they have been preserved. The rules for each special class therefore, though, generally speaking, maintained—as was to be expected of Roman institutions—with remarkable steadiness from the earliest times down to a late period, must be based upon a comprehensive view of all the examples, including those preserved by ancient writers, and not in the monumental form. These documents are, as a rule, incised on bronze plates (only some private acts are preserved on wood and lead), and therefore have their peculiar form of writing, abbreviation, interpunction, &c., as has been already explained. The older Roman laws are now collected, in trustworthy texts, in the *Corpus*, vol. i.; of the documents belonging to the later period a very comprehensive *sylloge* is given in C. G. Bruns's *Fontes juris Romani antiqui*.

1. Among the earliest occasions for committing to writing agreements, which may be supposed to have been originally verbal only, must certainly be reckoned international transactions (*leges foederis* or *foedera*). At the head of the prose records written in the Latin language we find the treaties of alliance of Tullus Hostilius with the Sabini (Dionysius Halic. iii. 33), of Servius Tullius with the Latini (Dionysius iv. 26; Festus p. 169; this was, partly, at the same time, as will afterwards appear, the oldest document of the sacred class), of the second Tarquinius with Gabii (Dionysius iv. 58; Festus, *Epit.* p. 56). They are followed, in the oldest republican period, by the celebrated *foedera* with Carthage; by the pacts of Sp. Cassius Vecellinus with the Latini of the year 261 (493 B.C.), which Cicero seems to have seen still in the *forum* behind the *rostra*, written on a bronze column (*Pro Balbo*, 23, 53; see also Livy ii. 33; Festus p. 166; and Mommsen's *Römische Forschungen*, ii. 153 sq.); and by the *foedus Ardeatinum* of 310 (444 B.C.) mentioned by Livy (iv. 7). Of all these documents nothing has been preserved in an authentic form, save some few words quoted from them by the ancient grammarians. Of one *foedus* only is there a fragment still in existence, relating to the Oscan *civitas libera* Bantia (*C.I.L.* i. 197); it contains the *clausula* of the *foedus*, which was written in Latin and in Oscan (see APULIA). On account of this peculiar circumstance, the document gave occasion to Klenze, and afterwards to Mommsen, to resume (for the sake of Roman jurisprudence, in the first instance) inquiry into the Oscan and other Italian dialects. Some other Roman *foedera* are preserved only in Greek, *e.g.* that with the Jews of the year 594 (160 B.C.) (Josephus, *Ant.* xii. 6. 10). Some others, made with the same nation between 610 and 615 (144 and 139 B.C.) (Jos. *Ant.* xiii. 5. 6 and 7. 8), are mentioned in an abridged form only, or given in that of a *senatus consultum*, to which they must formally be ascribed. Amongst the *foedera* may be reckoned also the curious oath, sworn, perhaps, according to a general rule obtaining for all *civitates foederatae*, by the citizens of a Lusitanian *oppidum*, Aritium, to Gaius Caesar on his accession to the throne in A.D. 37 (*C.I.L.* ii. 172; Wil. 2839).

Closely related to the *foedera* are the pacts between communities and private individuals, respecting *patronatus* or *hospitium* (*tabulae patronatus et hospitii*, also, when in small portable form, *tesserae hospitales*; cf. Plautus, *Poen.* 1047, of which many specimens from the end of the republic down to a late period of the empire have been preserved (see Gazzera, *Memorie dell' Academia di Torino*, vol. xxxv., 1831, p. 1 sq., and Mommsen, *Römische Forschungen*, i. 341 sq.). Of the numerous examples scattered through the different volumes of the *Corpus* may be quoted the *tessera Fundana*, containing the pact of hospitality between the community of Fundi and a certain Ti. Claudius (who cannot, with certainty, be identified), the oldest hitherto known, in the form of a bronze fish (*C.I.L.* i. 532; Henz. 7000; Wil. 2849); the *tabula* of the *pagus Gurzensium* in Africa, delivering the patronate to L. Domitius Ahenobarbus, Nero's grandfather, in 742 (12 B.C.), in the afterwards solemn form of a *tabella fastigata*, to be fixed in the *atrium* of the person honoured (Orel. 3693; Wil. 2850); that of the *civitas Pallantina* with a *peregrinus* named *Acces Licirni* of the year 752 (2 B.C.) (*Ephem. epigr.* i. 141;

Hermes, v., 1871, p. 371 seq.); that of *Lacilbula*, in Spain, with one Q. Marius Balbus, of A.D. 5 (*C.I.L.* ii. 1393); that of the *Bocchoritani* on the island of Majorca, of A.D. 6 (*C.I.L.* ii. 3695; Wil. 2851); the four relating to C. Silius Aviola, dating from A.D. 27 to 28, all found at Brescia (*C.I.L.* v. 4919-4922); that of the *colonia Julia Aug. legionis vii. Tupusuctu*, in Africa, with the imperial legate Q. Julius Secundus, of A.D. 55 (*C.I.L.* viii. 8837; Wil. 2851); that of two *gentilitates*, the *Desonci* and *Tridiavi*, of the *gens* of the *Zoelae*, in Spain, now in the museum of Berlin, which contains an older act of the year 27, and another more recent of the year A.D. 127 (*C.I.L.* ii. 2633; Orel. 156); that of the *respublica Pompelonensis* (Pampeluna in Spain) of A.D. 185 (*C.I.L.* ii. 2960; Wil. 2854); that of the *Segisamonenses*, in Spain, of A.D. 239, now in the museum at Burgos (*Ephem. epigr.* ii. 322); that of the *fabri subidiani* (*i.e.* subaediani, qui sub aede consistunt) of Cordova, of A.D. 348 (*C.I.L.* ii. 2211; Wil. 2861); and, in addition to many others, those found together at Rome, on the site of the palace of Q. Aradius Valerius Proculus, and belonging to him and other members of his family, from divers African cities and executed in A.D. 321 and 322 (*C.I.L.* vi. 1684-1688; Orel. 1079, 3058).

2. Hardly inferior in antiquity, and of superior value, are the remains of laws in the stricter sense of the word (*leges* and *plebiscita*), preserved to us in the originals, although unfortunately only in fragments more or less extensive. Of those laws the oldest and most important are the *lex Acilia* (for so it is in all probability to be styled) *repetundarum* of the year 631 (*C.I.L.* i. 198), which is incised on a bronze table about 2 metres broad, in 90 lines of about 200 to 240 letters each, and therefore extremely inconvenient to read, and the *lex agraria* of 643 (111 B.C.), written on the reverse of the table of the Acilia, abrogated shortly afterwards (*C.I.L.* i. 200); this is the third of the celebrated laws of C. Gracchus bearing upon the division of public lands. Then follow the *lex Cornelia de viginti quaestoribus*, a fragment of Sulla's legislation, the eighth table only, of the whole set, being preserved (*C.I.L.* i. 202); the *plebiscitum de Thermensibus*, on the autonomy of Termessus in Pisidia, proposed by the *tribuni plebis*, in 682 (72 B.C.), one of four or five large bronze plates (*C.I.L.* i. 204); the *lex Rubria de civitate Galliae cisalpinae* of 705 (49 B.C.), written in a new and more convenient form (belonging as it does to Caesar's legislation), in two columns, with numbered divisions, being the fourth out of an unknown number of plates (*C.I.L.* i. 205); the *lex Julia municipalis*, or, from the place where it was found, the *tabulae Heracleenses* of 709 (45 B.C.), written on the reverse of the much older Greek law of that community, preserved partly at Naples, partly in the British Museum (*C.I.L.* i. 206), also a fragment of Caesar's general municipal institutions; it contains a curious passage relating to the public promulgation of laws (v. 15). These are the laws of the Roman republic preserved in important fragments; some minor ones (brought together in *C.I.L.* i. 207-211) may be left out of account here. In the imperial age, laws in general were replaced by *senatus consulta* or by imperial decrees. It was also in the form of a *senatus consultum* that the *leges de imperio*, on the accession of the emperors, seem to have been promulgated. An example of such a law, preserved in part on a bronze tablet found at Rome, is the *lex de imperio Vespasiani* (*C.I.L.* vi. 930; Orel. i. 567). There is, besides, one special category of imperial constitutions which continued to be named *leges*, viz. the constitutions given by the emperors to the divers classes of *civitates*, based upon the ancient traditional rules of government applied to Rome itself as well as to the *coloniae* and *municipia*. Of this sort of *leges* some very valuable specimens have come from Spanish soil, viz. the *lex coloniae Juliae Genetivae Urbanorum sive Ursonis* (now Osuna), given to that colony by Caesar in 710 (44 B.C.), but incised, with some alterations, in the time of Vespasian, of which three bronze tables out of a much larger number remain (Hübner and Mommsen, *Ephem. epigr.* ii. 150 sq. and 221 sq.); the *lex Salpensana* and the *lex Malacitana*, given to these two *municipia* by Domitian, between A.D. 81 and 84, each on a large bronze plate, written respectively in two and in five columns, with the single chapters numbered and rubricated (*C.I.L.* ii. 1963, 1964; compare Mommsen, "Die Stadtrechte der lateinischen Gemeinden Salpensa und Malacca in der Provinz Baetica," in the *Abhandlungen der sächsischen Gesellschaft der Wissenschaften, philol.-histor. Classe*, vol. iii., 1857, p. 363 sq.); the *lex metalli Vipascensis*, given, with all probability, by one of the three Flavii, as a constitution to a mining district of southern Portugal, one bronze plate numbered iii.—three or more, therefore, being lost (see Hübner, *Ephem. epigr.* iii. 165 sq. and, for a popular account, the *Deutsche Rundschau*, August 1877, p. 196 sq.). The so-called military diplomas, although in certain respects nearly related to the *leges* of the later period, are better placed along with the imperial decrees.

3. A third species of official documents is formed by decrees of the senate of Rome, of the analogous corporations in the *coloniae* and *municipia*, and of the divers *collegia* and *sodalicia*, constituted, as a rule, after a similar fashion and debating in nearly the same way as the Roman and the municipal senates. The oldest Roman *senatus consulta* are those translated into the Greek language and containing treaties of alliance, as already mentioned. They are preserved either on monuments or by ancient authors, as Josephus: *e.g.* the fragment found at Delphi, from the year 568 (186 B.C.), and the *senatus consultum Thisbaeum*, from Thisbe in Boeotia, 584 (170 B.C.) (*Ephem. epigr.* i. 278 sq., ii. 102, and Joh. Schmidt, *Zeitschrift der Savigny-Stiftung*, vol. iii., 1881), those of 616, 619, 621, 649 (138–105 B.C.) (*C. I. Graec.* 2905, 2908, ii. 2485, 2737; Le Bas and Waddington iii. 195-198; *Annali dell' Instituto*, vol. xix. 1847, p. 113; *Ephem. epigr.* iv. 213 sq.), and those relating to the Jews, dating from 615, 621 and 710 (139, 133 and 44 B.C.) (Josephus, *Ant.* xiii. 9. 2, xiv. 8. 5 and 10. 9). The two oldest *senatus consulta* written in Latin are also preserved in a more or less complete form only by ancient authors; they are the *sc. de philosophis et rhetoribus* of 593 (161 B.C.) (Gellius, *Noct. Att.* xv. 11. 1) and that *de hastis Martiis* of 655 (99 B.C.) (Gellius iv. 6. 2). The only one belonging to the oldest period preserved in the original Latin form, of which only a part exists, together with the Greek translation, is the *sc. Lutatianum*, relating to Asclepiades of Clazomenae and his companions, dating from 676 (77 B.C.) (*C.I.L.* i. 203). The rest, belonging to the later epoch from Cicero downwards, about twenty in number, are mostly preserved only in an abridged form by ancient writers,—such as Cicero, Frontinus, Macrobius,—or in Justinian's *Digesta* (see Hübner, *De senatus populique Romani actis*, Leipzig, 1859, p. 66 sq.); a few exist, however, in a monumental form, complete or in fragments—as the two *sc.* on the *ludi saeculares*, dating from 17 B.C. and A.D. 47, preserved on a marble slab found at Rome (*C.I.L.* vi. 877); the fragments of two *sc.* in honour of Germanicus and the younger Drusus, from Rome, on bronze tablets (*C.I.L.* vi. 911-912; Henz. 5381-5282); the two *sc. Hosidianum* and *Volusianum*, containing regulations for the demolition and rebuilding of houses in Rome, incised on the same bronze plate, found at Herculaneum, dating from Nero's time, between A.D. 41 and 46 and from 56 (Orel. 3115; Mommsen, *Berichte der sächs. Gesellschaft der Wissenschaften, philol.-histor. Classe*, 1852, p. 272 sq.); and, of a later period, the *sc. Cassianum* or *Nonianum* of A.D. 138, containing a market regulation for the *saltus Beguensis* in Africa, where it has been found preserved in two examples on stone slabs (*Ephem. epigr.* ii. 271 sq., not complete in Wil. 2838), and the fragment of that for Cyzicus, belonging to the reign of Antoninus Pius (*Ephem. epigr.* iii. 156 sq.). There exists, besides, a chapter of a *sc.*, relating to the *collegia*, inserted in the decree of a *collegium* at Lanuvium, to be mentioned below. Of the municipal decrees, of which a greater number is preserved (see Hübner, *De sen. populique Rom. actis*, p. 71 sq.), only a few of the more important may be mentioned here: the *lex Puteolana de parieti faciundo* of 649 (105 B.C.) (*C.I.L.* i. 577; Orel. 3697; Wil. 697); the two *decreta* (or so-called *cenotaphia*) *Pisana* in honour of Lucius and Gaius Caesar, the grandsons of Augustus, of A.D. 3 (*C.I.L.* xi. 1420, 1421; Orel. 642, 643; Wil. 883); the *decretum Lanuvinum* of A.D. 133, containing the regulations of a *collegium funeraticium*, styled *collegium salutare Dianae et Antinoi* (Orel. 6086; Wil. 319); and the *decretum Tergestinum*, belonging to the time of Antoninus Pius (*C.I.L.* v. 532; Henz. 7167; Wil. 693). There are, however, more than thirty others preserved, some of them, such as those from Naples, written in the Greek language. Of the third speciality, the *decreta collegiorum*, only the *lex collegii aquae* of the 1st century (Marini, *Atti de' fratelli arvali*, p. 70; Rudorff and Mommsen, *Zeitschrift für Rechtsgeschichte*, vol. xv., 1850, pp. 203, 345 sq.), and the *lex collegii Aesculapii et Hygiae*, of 153 (*C.I.L.* vi. 10,234; Orel. 2417; Wil. 320) need be mentioned here; many more exist. One of them, the *lex collegii Jovis Cerneni*, dating from A.D. 167, found at Alburnus major in Dacia, is preserved on the original *tabella cerata* on which it was written (*C.I.L.* iii. 924; Henz. 6087; Wil. 321).

4. The fourth species of *instrumenta* are the decrees, sometimes in the form of letters, of Roman and municipal magistrates, and of the emperors and their functionaries, incised, as a rule, on bronze tablets. The oldest decree in the Latin language which has been preserved is that of L. Aemilius Paulus, when praetor in Hispania Baetica, dating from 189 B.C., for the Turris Lascutana in southern Spain (*C.I.L.* ii. 5041; Wil. 2837); of the same date is a Greek one of Cn. Manlius, consul of the year 565, for the Heracleenses Cariae (Le Bas and Waddington n. 588). Then follow the famous *epistula consulum* (falsely styled *senatus consultum*) *ad Teuranos de bacchanalibus*, dated 568 (186 B.C.) (*C.I.L.* i. 196); the sentence of the two Minucii, the delegates of the senate, on a dispute concerning the boundaries between the Genuates and Viturii, 117 B.C. (*C.I.L.* i. 199; Orel. 3121; Wil. 872); and the *epistula* of the praetor L. Cornelius (perhaps Sisenna), the praetor of 676 (78 B.C.) *ad Tiburtes* (*C.I.L.* i. 201). These belong to the republican age. From the imperial period a great many more have come down to us of varying quality. Some of them are decrees or constitutions of the emperors themselves. Such are the decree of Augustus on the aqueduct of Venafrum (*C.I.L.* x. 4842; Henz. 6428; Wil. 784); that of Claudius, found in the Val di Nona, belonging to A.D. 46 (*C.I.L.* v. 5050; Wil. 2842); of Vespasian for Sabora in Spain (*C.I.L.* ii. 1423), and for the Vanacini in Corsica (Orel. 4031); of Domitian for Falerii (Orel. 3118); the epistles of Hadrian relating to Aezani in Phrygia, added to a Greek decree of Avidius Quietus (*C.I.L.* iii. 355; Henz. 6955), and relating to Smyrna, in Greek, with a short one of Antoninus Pius, in Latin (*C.I.L.* iii. 411; Orel. 3119); the decrees of Commodus relating to the *saltus Burunitanus* in Africa (*C.I.L.* viii. 10,570; cf. *Eph. epigr.* v. 471); of Severus and Caracalla for Tyra (Akkerman in Moesia), Latin and Greek (*C.I.L.* iii. 781; Henz. 6429); of Valerian and Gallienus for Smyrna, also Latin and Greek (*C.I.L.* iii. 412); of Diocletian *de pretiis rerum venalium*, containing a long list of prices for all kinds of merchandise,

preserved in divers copies more or less complete, in Latin and Greek (*C.I.L.* iii. 801 sq.; compare *Ephem. epigr.* iv. 180, and, as similar monuments, the *lex portus* of Cirta, of A.D. 202 Wil. 2738, and the fragment of a regulation for the importation of wines into Rome, Henz. 5089, Wil. 2739); and some of the age of Constantine, as that relating to Hispellum in Umbria (Henz. 5580; Wil. 2843), that of Julian found at Amorgos (*C.I.L.* iii. 459; Henz. 6431), and some others, of which copies exist also in the juridical collections. Of two imperial rescripts of a still later age A.D. 413, fragments of the originals, written on papyri, have been found in Egypt (see Mommsen and Jaffé, *Jahrbuch des gemeinen deutschen Rechts*, vol. vi., 1861, p. 398; Hänel, *Corpus legum*, p. 281). Imperial decrees, granting divers privileges to soldiers, are the *diplomata militaria* also, mentioned above, incised on two combined bronze tablets in the form of *diptycha* (L. Renier, "Recueil de diplômes militaires"; *C.I.L.* iii. 842 sqq., 1955 sqq.; Wil. 2862-2869), belonging to nearly all emperors from Claudius down to Diocletian. Though not a decree, yet as a publication going back directly to the emperor, and as being preserved in the monumental form, the speech of the emperor Claudius, delivered in the senate, relating to the Roman citizenship of the Gauls, of which Tacitus gives an abstract (*Ann.* xi. 23), ought also to be mentioned here; it was engraved on large bronze slabs by the public authority of Lugudunum (Lyons), where a large fragment of it is still preserved (Boissieu, *Inscriptions antiques de Lyon*, p. 132 sq.). Another sort of decrees, relating to a great variety of subjects, has to be mentioned, emanating, not directly from the emperors, but from their functionaries. Such are the decree of the proconsul L. Helvius Agrippa, of the year A.D. 68, on the boundaries of some tribes on the island of Sardinia (*C.I.L.* x. 7852; Wil. 872 *a*); that of the prefect of Egypt, Tiberius Julius Alexander, written in Greek, the same year (*C. I. Graec.* 4957); that of C. Helvidius Priscus, on a similar question relating to Histonium, belonging perhaps to the end of the 1st century (Wil. 873); that of the legate of Trajan, C. Avidius Nigrinus, found at Delphi, in Greek and Latin (*C.I.L.* iii. 567; Orel. 3671; Wil. 874); a rescript of Claudius Quartinus, perhaps the imperial legate of the Tarraconensis, of the year A.D. 119, found at Pampluna (*C.I.L.* ii. 2959; Orel. 4032); the epistle of the *praefecti praetorio* to the magistrates of Saepinum, of about A.D. 166–169 (*C.I.L.* ix. 2438; Wil. 2841); the decree of L. Novius Rufus, another legate of the Tarraconensis, who *ex tilia recitavit*, of A.D. 193 (*C.I.L.* ii. 4125; Orel. 897; Wil. 876); the sentence of Alfenius Senecio, then subprefect of the *classis praetoria Misenensis*, belonging to the beginning of the 3rd century, formerly existing at Naples (*C.I.L.* x. 3334); and some others of the 4th and 5th centuries, not requiring specific mention here. Quite a collection of epistles of high Roman functionaries is found in the celebrated inscription of Thorigny (Mommsen, *Berichte der sächs. Gesellschaft der Wissenschaften*, 1852, p. 235 sq.). The letter of a provincial functionary, a priest of Gallia Narbonensis, to the *fabri subaediani* of Narbonne, of the year 149, may also be mentioned (Henz. 7215; Wil. 696 *a*). To these must be added the *tabulae alimentariae*, relating to the well-known provision made by Trajan for the relief of distress among his subjects, such as that of the Ligures Baebiani (*C.I.L.* ix. 1455; Wil. 2844) and that of Veleia near Parma (Wil. 2845); while evidence of similar institutions is furnished by inscriptions at Tarracina, at Sicca in Africa, and at Hispalis in Spain (Wil. 2846-2848; *C.I.L.* ii. 1174). At the close of this long list of official documents may be mentioned the *libellus* of the *procurator operum publicorum a columna divi Marci* of the year 193 (*C.I.L.* vi. 1585; Orel. 39; Wil. 2840) and the *interlocutiones* of the *praefecti vigilum* on a lawsuit of the *fullones* of Rome, of A.D. 244, inscribed on an altar of Hercules (*C.I.L.* vi. 266; Wil. 100). These documents form a most instructive class of *instrumenta*.

5. Many documents, as may be supposed, were connected with religious worship, public and private. The oldest *lex templi*, which continued in force until a comparatively late period, was the regulation given by Servius Tullius to the temple of Diana on the Aventine, after the conclusion of the federal pact with the Latini, noticed above. Mention is made of this ancient law as still in force in two later documents of a similar character, viz. the dedication of an altar to Augustus by the plebs of Narbo in southern France, of A.D. 764, but existing only, at Narbonne, in a copy, made perhaps in the 2nd century (*C.I.L.* xii. 4333; Orel. 2489; Wil. 104), and that of an altar of Jupiter, dedicated at Salonae in Dalmatia in A.D. 137, still existing in part at Padua (*C.I.L.* iii. 1933; Orel. 2490; Wil. 163). Another *lex fani* still existing is that of a temple of Jupiter Liber at Furfo, a *vicus* of southern Italy, of the year 696 (58 B.C.), but copied, in vernacular language, from an older original (*C.I.L.* i. 603; Orel. 2488; Wil. 105; compare Jordan in *Hermes*, vol. vii., 1872, pp. 201 sq.). The lists of objects belonging to some sanctuaries or to the ornaments of statues are curious, such as those of the *Diana Nemorensis* at Nemi (Henz. *Hermes*, vol. vi., 1871, pp. 8 sq.), and of a statue of Isis in Spain (Hübner, *Hermes*, vol. i., 1866, pp. 345 sq.; compare *C.I.L.* ii. 2060, 3386, Orel. 2510, Wil. 210), and two *synopses* from a temple at Cirta in Africa (Wil. 2736, 2737). The *sortes* given by divinities may also be mentioned (see *C.I.L.* i. 267 sq.; Wil. 2822). To a temple also, though in itself of a secular character, belonged a monument of the highest historical importance, viz. the *Index rerum a se gestarum*, incised on bronze slabs, copies of which Augustus ordered to be placed, in Latin and Greek, where required, in the numerous Augustea erected to himself in company with the Dea Roma. This is known as the *Monumentum Ancyranum*, because it is at Angora in Asia Minor that the best preserved copy of it, in Greek and Latin, exists; but fragments remain of other copies from other localities (see *C.I.L.* iii. 779 sq., and the special editions of Mommsen, Berlin, 1865, and Bergk, Göttingen, 1873). Among the inscriptions relating to sacred buildings must also be reckoned the numerous fragments of Roman calendars, or *fasti anni Juliani*, found at Rome and other places, which have been arranged and fully explained by Mommsen (*C.I.L.* i., 2nd ed., part ii.; compare for those found in Rome, *C.I.L.* vi. 2294-2306). Local, provincial or municipal *calendaria* have likewise been found (as the *feriale Cumanum*, *C.I.L.* i. part ii. p. 229, and the *Capuanum*, *C.I.L.* x. 3792). Many other large monumental inscriptions bear some relation, more or less strict, to sacred or public buildings. Along with the official calendar exhibited on the walls of the residence of the *pontifex maximus*, the list of the eponymous magistrates, inscribed by the order of Augustus on large marble slabs, was publicly shown—the *fasti consulares*, the reconstruction and illustration of which formed the life-work of Borghesi. These have been collected, down to the death of Augustus, by Henzen, and compared with the additional written testimonies, by Mommsen, in the *Corpus* (vol. i., 2nd ed., part ii.), along with the *acta triumphorum* and other minor fragments of *fasti* found in various Italian communities, while the *fasti sacerdotum publicorum populi Romani*, together with the *tabula feriarum Latinarum*, are given in the volume devoted exclusively to the monuments of Rome (vol. vi. 441 sq.; compare *Hermes*, vol. v., 1870, p. 379, and *Ephem. epigr.* ii. 93, iii. 74, 205 sq.). Documents of the same kind, as, for example, the *album ordinis Thamugadensis* from Africa (*C.I.L.* viii. 2403, 17903), and a considerable mass of military lists (*latercula*, of which those belonging to the garrison of the metropolis are brought together in *C.I.L.* vi. 651 sq.), are given on many dedicatory and honorary monuments, chiefly from Lambaesis in Africa (*C.I.L.* viii.). As those documents, though having only a partial claim to be ranked with the sacred ones, derive, like many other dedicatory monuments, their origin and form from that class, so also the protocols (*acta*), which, from Augustus downwards, seem to have been preserved in the case of all important *collegia magistratuum*, now survive only from one of the largest and most distinguished *collegia sacerdotum*, in the *acta collegii fratrum Arvalium*, to which Marini first drew the attention of epigraphists; they form one of the most important masses of epigraphic monuments preserved to us in the Latin language (see *C.I.L.* vi. 459 sq., *Ephem. epigr.* ii. 211 sq., and Henzen's *Acta fratrum Arvalium*, Berlin, 1874).

6. Another species of instruments is formed by private documents. They have been incidentally preserved (inserted, for instance, into sepulchral and honorary inscriptions), in the later period not unfrequently in monumental form, as the testaments, given partly or in full, mentioned above (viz. that of Dasumius and the Gaul, *C.I.L.* vi. 10229, Wil. 314, 315, and some *capita testamentorum* or *codicilli*, as that of M. Meconius Leo found at Poetelia—*C.I.L.* x. 113, 114; Orel. 3677, 3678; Wil. 696), and the donations, such as those of T. Flavius Syntrophus (*C.I.L.* vi. 10239; Wil. 313), of T. Flavius Artemidorus (Wil. 310), of Statia Irene and Julia Monime (*C.I.L.* vi. 10231, 10247; Wil. 311, 318). Of a peculiar description is the *pactum fiduciae*, found in Spain, engraved on a bronze tablet, and belonging, in all probability, to the 1st century (*C.I.L.* ii. 5042), which seems to be a formulary. Other documents relating to private affairs exist in their original form, written on *tabellae ceratae*. Those found together in a mining district of Dacia have been arranged and explained by Mommsen and Zangemeister (*C.I.L.* iii. 291 sq., with facsimiles); those found at Pompeii in 1875, containing receipts of the banker L. Caecilius Jucundus, have been published in *C.I.L.* iv. suppl.). These documents are written in cursive letters; and so mostly, too, are some other curious private monuments, belonging partly to the sacred inscriptions—the *defixiones* (cf. Tac. *Ann.* ii. 69), imprecations directed against persons suspected of theft or other offences, who, according to a very ancient superstition, were in this way believed to be delivered to punishment through the god to whom the *defixio* was directed. The numerous Greek and Latin (and even Oscan) examples of this usage have been brought together by Audollent, *Defixionum tabellae quotquot innotuerunt tam in Graecis Orientis quam in totius Occidentis partibus praeter Atticas* (Paris, 1904); compare *C.I.L.* i. 818-820, *C.I.L.* vii. 140). Only a few of them are incised on stone (as that to the *Dea Ataecina* from Spain, *C.I.L.* ii. 462); for the most part they are written, in cursive letters, or in very debased capitals, on small bronze or lead tablets (so *C.I.L.* i. 818, 819; Henz. 6114, 6115; Wil. 2747, 2748), to be laid in the tombs of the "defixi," or deposited in the sanctuaries of some divinity.

7. Many of the private documents just alluded to have not a monumental character similar to that of the other inscriptions in the wider sense of the word, as they are written on materials not very durable, such as wood and lead—in the majority of cases, in cursive characters; but, nevertheless, they cannot be classed as literature. As a last species, therefore, of *instrumenta*, there remain some documents, public and private, which similarly lack the strict monumental character, but still are to be reckoned among inscriptions. These are the inscriptions painted or scratched (*graffiti*) on

the walls of the buildings of ancient towns, like Pompeii, where, as was to be expected, most of them have been preserved, those from other ancient cities buried by the eruptions of Vesuvius and from Rome being very small in number. All the various classes of these inscriptions—public and private advertisements, citations for the municipal elections, and private scribblings of the most diverse (and sometimes most indecent) character, one partly collected by Chr. Wordsworth (*Inscriptiones Pompeianae*, &c., London, 1837, 1846)—are now arranged by Zangemeister in the *Corpus*, vol. iv. with supplement (some specimens in Wil. 1951 sq.), whence their peculiar palaeographic and epigraphic rules may be learned. And, lastly, as related to some of these advertisements, though widely differing from them in age and character, may be mentioned the so-called *diptycha consularia*, monuments, in the first instance, of the still very respectable skill in this branch of sculpture to be found at this late period. They are carved-ivory tablets, in the form of *pugillaria*, and seem to have been invitations to the solemnities connected with the accession of high magistrates, especially to the spectacles of the circus and amphitheatre; for they contain, along with representations of such spectacles, the names, and often the portraits, of high functionaries, mostly of the 5th and 6th centuries. Since Gori's well-known work on this class of monuments (*Thesaurus veterum diptychorum*, &c., 3 vols., Florence, 1759) no comprehensive collection of them has been published, but a full list is given by H. de Villefosse in the *Gazette Archéologique* of 1884; as specimens see *C.I.L.* ii. 2699, and v. 8120, 1–9.

Bibliography.—As a "Textbook" of Roman epigraphy R. Cagnat, *Cours d'épigraphie latine* (3rd ed., Paris, 1898, with supplement, 1904) can be heartily recommended. But students must be warned against Zell's *Handbuch der römischen Epigraphik* (2 vols., Heidelberg, 1850–1852), an unsatisfactory work which is open to serious criticism. J. C. Egbert's *Introduction to the Study of Latin Inscriptions* (1896) is designed for American and English students. For Christian inscriptions Le Blant's *Manuel d'épigraphie chrétienne d'après les marbres de la Gaule* (Paris, 1869) may still be consulted with advantage. (E.Hü.; W. M. L.)

INSECT, the anglicized form of the Late Lat. *insectum*, used by Pliny in his *Natural History* as the equivalent of the Gr. *ἔντομον*. Aristotle had included in one class "Entoma" the six-legged arthropods which form the modern zoological class of the Hexapoda or Insecta, besides the Arachnida, the centipedes and the millipedes. The word was introduced to English readers in a translation (1601) of Pliny's *Natural History* by Philemon Holland, who defined "insects" as "little vermine or smal creatures which have (as it were) a cut or division betwene their heads and bodies, as pismires, flies, grashoppers, under which are comprehended earthworms, caterpilers, &c." Few zoological terms have been more loosely used both by scientific and popular writers. The definition just quoted might include all animals belonging to the groups of the Arthropoda and Annelida, and U. Aldrovandi in *De animalibus insectis* (1602) almost contemporaneously distinguished between "terrestrial insects," including woodlice, earthworms and slugs, and "aquatic insects," comprising annelids and starfishes. Perhaps the widest meaning ever attached to the word was that of R.A.F. de Réaumur, who "would willingly refer to the class of insects all animals whose form would not allow them to be placed in the class of ordinary quadrupeds, in that of birds, or in that of fishes. The size of an animal should not suffice to exclude it from the number of insects. . . . A crocodile would be a terrible insect; I should have no difficulty, however, in giving it that name. All reptiles belong to the class of insects, for the same reasons that earthworms belong to it."

The class Insecta of Linnaeus (1758) was coextensive with the Arthropoda of modern zoologists. The general practice for many years past among naturalists has been to restrict the terms "Insecta" and "insect" to the class of Arthropods with three pairs of legs in the adult condition: bees, flies, moths, bugs, grasshoppers, springtails are "insects," but not spiders, centipedes nor crabs, far less earthworms, and still less slugs, starfishes or coral polyps.

For a general account of the structure, development and relationships of insects, see Arthropoda and Hexapoda, while details of the form, habits and classification of insects will be found in articles on the various orders or groups of orders (Aptera, Coleoptera, Dipteria, Hemiptera, Hymenoptera, Lepidoptera, Neuroptera, Orthoptera, Thysanoptera), and in special articles on the more familiar divisions (Ant, Bee, Dragon-fly, Earwig, &c.). The history of the study of insects is sketched under Entomology.

(G. H. C.)

INSECTIVORA, an order of non-volant placental mammals of small size, with a dentition adapted to an insect-diet. In nearly all cases these creatures are nocturnal, and the majority are terrestrial, many burrowing in the ground, although a few are arboreal and others aquatic. They have plantigrade or partially plantigrade feet, that is to say, they apply the whole or the greater portion of the soles to the ground when walking; and there are generally five toes, each terminating in a claw, and the first never being opposable to the others in either the fore or hind limb. A full series of differentiated teeth, including temporary or deciduous milk-molars, is developed, and the cheek-teeth have distinct roots and are crowned with sharp cusps, which in some instances are three in number and arranged in a triangle. Very frequently the number of the teeth is the typical forty-four, arranged as $i.\ \frac{3}{3}$, $c.\ \frac{1}{1}$, $p.\ \frac{4}{4}$, $m.\ \frac{3}{3}$, but occasionally there is a fourth pair of molars, while the incisors may be reduced to two pairs above and one below, and the canine is frequently like an incisor or a premolar. The skull is of a primitive type, often with vacuities on the palate, as in marsupials, with a small brain-chamber, and the tympanic bone generally ring-like instead of forming a bladder-shaped bulla; except in the African *Potamogale*, clavicles, or collar-bones, are always present; the humerus generally has a perforation on the inner side of its lower extremity; and a centrale bone is usually present in the carpus. In the brain the smooth hemispheres are so short as to leave the cerebellum and sometimes even the corpora quadrigemina exposed. The uterus is two-horned; the placenta, so far as known, is deciduate and discoidal; the testes are abdominal or inguinal; and the teats usually numerous. The body in several instances is covered with sharp spines in place of hair.

The great majority of the Insectivora are nocturnal in their habits, and their whole structure indicates an extremely low grade of organisation, fully as low as that of marsupials. It is noteworthy that the dentition in several of the groups approximates to that of the extinct mammals of the Jurassic epoch (see Marsupialia), and exhibits more or less distinctly the primitive tritubercular type. Although the past history of the group is very imperfectly known, it seems probable that the Insectivora are nearly related to the original primitive mammalian stock. Indeed, it has been stated that were it not for the apparently advanced type of placenta, they might easily be regarded as the little modified descendants of the ancestors of most other mammals. Probably they are in some way related to the creodont carnivores (see Creodonta), but if, as has been suggested, the latter are akin to the primitive ungulates, the connexion would seem to be less close than has been sometimes supposed.

Representatives of this order are found throughout the temperate and tropical parts of both hemispheres, with the exception of South America (where only a few shrews have effected an entrance from the north) and Australia, and exhibit much variety both in organization and in habit. The greater number are cursorial, but some (*Talpa, Chrysochloris, Oryzoricles*) are burrowing, others (*Limnogale, Potamogale, Nectogale, Myogale*) aquatic, and some (*Tupaiidae*) arboreal. To the great majority the term insectivorous is applicable, although *Potamogale* is said to feed on fish, and the moles live chiefly on worms. Notwithstanding the nature of their food, much variety prevails in the form and number of the teeth, and while in many cases the division into incisors, canines, premolars and molars may be readily traced, in others, forming the great majority of the species, such as the shrews, this is difficult.

In most cases the brain-cavity is of small relative capacity, and in no instance is the brain-case elevated to any considerable extent above the face-line. The facial part of the skull is generally much produced, and the premaxillary and nasal bones well developed; but the cheek, or zygomatic arch, is usually slender or deficient, the latter being the case in most of the species, and post-orbital processes of the frontals are found only in the *Tupaiidae* and *Macroscelididae*. The number of dorsal vertebrae varies from 13 in *Tupaia* to 19 in *Centetes*, of lumbar from 3 in *Chrysochloris* to 6 in *Talpa* and *Sorex*, and of caudal from the rudimentary vertebrae of *Centetes* to the 40 or more well-developed ones of *Microgale*.

The breast-bone, or sternum, is variable, but generally narrow, bilobate in front and divided into segments. The shoulder-girdle presents extreme adaptive modifications in the mole, in relation to the use of the fore-limbs in burrowing; but in the golden moles the fore-arm and fore-foot alone become specially modified. In *Macroscelides* the bones of the fore-arm are united at their lower ends, but in all other Insectivora the radius and ulna are distinct. The fore-foot has generally five digits; but in *Rhynchocyon* and in one species of *Oryzorictes* the first toe is absent, and in the moles it is extremely modified. The femur has, in most species, a prominent ridge below the greater trochanter presenting the characters of a third trochanter. In *Tupaia*, *Centetes*, *Hemicentetes*, *Ericulus* and *Solenodon* the tibia and fibula are distinct, but in most other genera united. The hind-foot consists usually of five digits (rarely four by reduction of the first), and in some, as in the leaping species (*Macroscelides*, *Rhynchocyon*), the tarsal bones are elongated. The form of the pelvis, and especially of the symphysis pubis, varies within certain limits, so that while in the *Tupaiidae* and *Macroscelididae* there is a long symphysis, in the *Erinaceidae*, *Centetidae* and *Potamogalidae* it is short, and in the *Soricidae*, *Talpidae* and *Chrysochloridae* there is none.

Owing to the similarity in the character of the food, the truly insectivorous species, forming more than nine-tenths of the order, present little variety in the structure of the digestive organs. The stomach is a simple, thin-walled sac; sometimes as in *Centetes*, with the pyloric and oesophageal openings close together; the intestinal canal has much the same calibre throughout, and varies from three (in the shrews) to twelve times (in the hedgehogs) the length of the head and body. In the arboreal *Tupaia* and the allied *Macroscelididae*, which probably feed on vegetable substances as well as insects most of the species possess a caecum. The liver is deeply divided into lobes, the right and left lateral being cut off by deep fissures; both the caudate and Spigelian lobes are generally well developed, and the gall-bladder, usually large and globular, is placed on the middle of the posterior surface of the right central lobe.

All the members of the order appear to be highly prolific, the number of young varying from two to eight in the hedgehog, and from twelve to twenty-one in the tenrec. The position of the milk-glands and the number of teats vary greatly. In *Solenodon* there is a single pair of post-inguinal teats, but in most species these organs range from the thorax to the abdomen, varying from two pairs in *Gymnura* to twelve in the tenrec. In the golden moles the thoracic and inguinal teats are lodged in deep cut-shaped depressions.

Scent-glands exist in many species. In most shrews they occur on the sides of the body at a short distance behind the axilla, and their exudation is probably protective, as few carnivorous animals will eat their dead bodies. In both species of *Gymnura* and in *Potamogale* large pouches are situated on each side of the rectum, and discharge their secretions by ducts, opening in the first-named genus in front of and in the latter within the margin of the vent. In the tenrec similarly situated glands discharge by pores opening at the bottom of deep pits.

The skin is thin, but in many species lined with well-developed muscles, which are probably more developed in hedgehogs than in any other mammals. In this family and in the tenrec most of the species are protected by spines implanted in the skin-muscle, or panniculus carnosus.

Tree-Shrews.

The Insectivora may be divided into two groups, according to the degree of development of the union between the two halves of the pelvis. The first group is characterized by the full development of this union, both pubis and ischium entering into the symphysis. The tympanum remains as a ring within an auditory bulla; the orbit is either surrounded by bone, or separated from the hinder part of the skull by a post-orbital process of the frontal; the upper molars have broad 5-cusped crowns with a W-shaped pattern; and the intestine is generally furnished with a caecum. The first family of this group is the *Tupaiidae*, represented by the tree-shrews, or tupaias, of the Indo-Malay countries, characterized by the complete bony ring round the eye-socket, the freedom of the fibula from the tibia in the hind-limb, and the absence of any marked elongation of the tarsus. The dental formula is $i.\ \frac{2}{3},\ c.\ \frac{1}{1},\ p.\ \frac{3}{3},\ m.\ \frac{3}{3}$, total 38. In appearance and habits tree-shrews are extremely like squirrels, although they differ, of course, *in toto* as regards their dentition. A large number of species are included as the typical genus *Tupaia*, which ranges from north-eastern India to the great Malay Islands. In these animals the tail has a fringe of long hairs on opposite sides throughout its length. In the pen-tailed tree-shrew (*Ptilocercus lowii*), fig. 1, the only representative of its genus, and a native of Sumatra, Borneo and the Malay Peninsula, the fringes of long hair are confined to the terminal third of the tail. There are also differences in the skulls of the two genera. A third genus, *Urogale*, represented by *U. cylindrura* of the mountains of Mindanao, in the Philippines, and *U. everetti*, of Borneo, has been established for the round-tailed tupaias, in which the tail is uniformly short-haired, and the second upper incisor and the lower canines are unusually large, the third lower incisor being proportionately small, and also erect, while the second upper incisor resembles a canine. (See TREE-SHREW.)

In Africa the tupaias are apparently represented by the jumping-shrews, or elephant-shrews (so called from their elongated muzzles), constituting the family *Macroscelididae*. From the *Tupaiidae* the members of this family are readily distinguished by the fact that the socket of the eye, in place of having a complete bony ring, is separated from the hinder part of the skull merely by a post-orbital process of

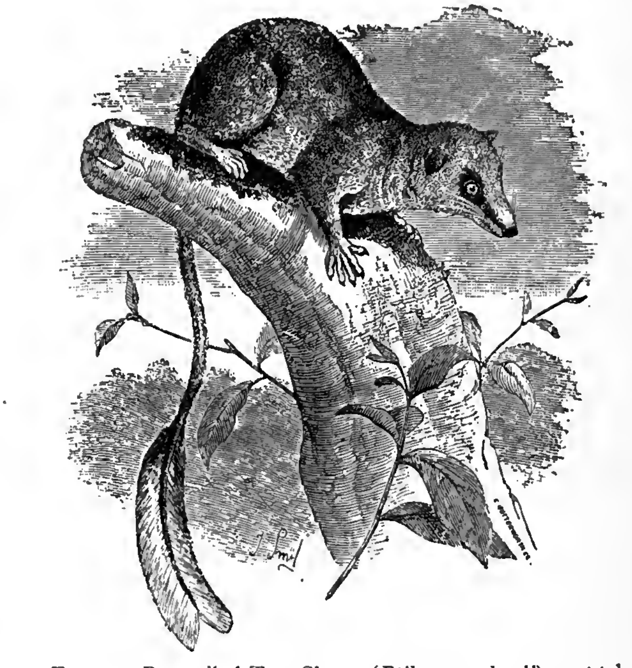

FIG. 1.—Pen-tailed Tree-Shrew (*Ptilocercus lowii*). × ½.

the frontal bone, and also by the more or less marked elongation of the tarsus or lower portion of the hind-limb; another feature being the union of the lower ends of the tibia and fibula. As indicated by one of their names, the members of the group leap after the fashion of gerbils, or jerboas, and hence walk much more on their toes than the majority of the order. In the typical genus *Macroscelides*, which ranges all over Africa and has numerous specific representatives, the dental formula is $i.\ \frac{3}{3},\ c.\frac{1}{1},\ p.\ \frac{4}{4},\ m.\ \frac{2}{2\text{ or }3}$, total 40 or 42; while there are five toes to each foot, and the lower ends of the radius and ulna are united. In *Petrodromus* (fig. 2) of East Africa, there are only four front-toes, and the hairs on the lower part of the tail form stiff bristles, with swollen tips; the dental formula being the same as that of those species of *Macroscelides* as have only two lower molars. A further reduction of the number of the digits takes place in the long-nosed jumping-shrews of the genus *Rhynchocyon*, which are larger animals with a much longer snout, only four toes to each foot, and a dental formula of $i.\ \frac{1\text{ or }0}{3},\ c.\ \frac{1}{1},\ p.\ \frac{4}{4},\ m.\ \frac{2}{2}$, total 36 or 34. Some of the species, all of which are East African, differ from the members of the typical genus by the deep rufous brown instead of olive-grey colour of their coat. (See JUMPING-SHREW.)

In the second group, which includes all the other members of the order, the pelvic symphysis is either lacking or formed merely by the epiphyses of the pubes; the orbit and temporal region of the skull are confluent; and, except in the *Talpidae* and *Chrysochloridae*, the tympanum is ring-like, the tympanic cavity being formed by the alisphenoid and basisphenoid bones. The upper molars are tricuspident, being either of the typical or a modified form of what is known as the tritubercular sectorial type. There is no caecum.

The first representatives of this group are the moles, or *Talpidae*, in which the lower ends of the tibia and fibula are united (fig. 3, *t, fb*), there is a descent of the testes, the tympanum forms a bladder-like bulla, the zygomatic, or cheek-arch, although slender, is complete, there is no pelvic symphysis, the upper molars are five-cusped, and the first upper incisor is simple, and the lower vertical. In habits the majority of the family are burrowing, but a few are aquatic; and all feed on animal substances. The distribution is limited to the temperate regions of Europe, Asia and North America.

Moles.

Throughout the family the eyes are minute, and in some species are covered with skin; the ears are short and hidden in the fur; and the fore-limbs are generally more or less modified for digging.

The true moles of the genus *Talpa* are the typical representatives of the first subfamily, or *Talpinae*, in which the clavicle (fig. 3, *cl.*) and humerus (*h*) are very short and broad, while there is an additional sickle-like bone (*fc*) on the inner side of the fore-foot. In *Talpa* itself the first upper incisor is but little larger than the second, the fore-foot is very broad, and the dental formula is $i.\ \frac{3}{3},\ c.\frac{1}{1 \text{ or } 0},\ p.\ \frac{3}{3},\ \frac{3}{4}, \text{ or } \frac{4}{4},\ m.\ \frac{3}{3}$. There are about a dozen species, all confined to

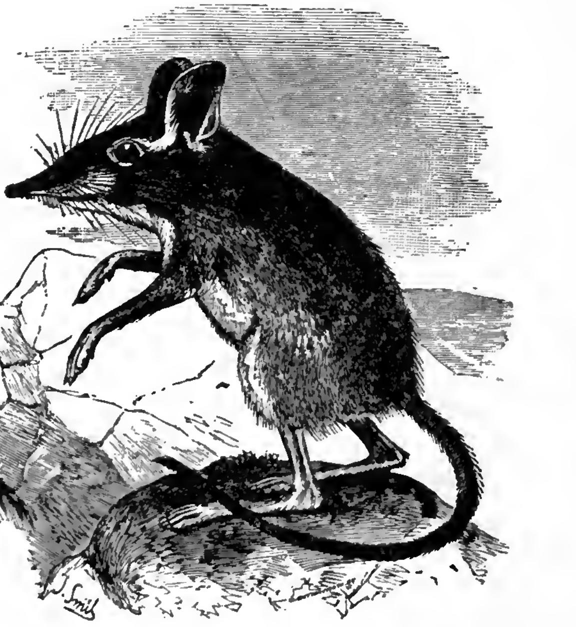

FIG. 2.—Peter's Jumping-Shrew (*Petrodromus tetradactylus*). × ½.

the Old World. The variation in the dental formula of some of the best known of these is as follows:—

$i.\ \frac{3}{3},\ c.\ \frac{1}{0},\ p.\ \frac{4}{4},\ m.\ \frac{3}{3} \times 2$ (*T. wogura, robusta*).
$i.\ \frac{3}{3},\ c.\ \frac{1}{1},\ p.\ \frac{4}{4},\ m\ \frac{3}{3} \times 2$ (*T. europaea, caeca, romana, longirostris, micrura*).
$i.\ \frac{3}{3},\ c.\ \frac{1}{1},\ p.\ \frac{3}{4},\ m.\ \frac{3}{3} \times 2$ (*T. leucura leptura*).
$i.\ \frac{3}{3},\ c.\ \frac{1}{1},\ p.\ \frac{3}{3},\ m.\ \frac{3}{3} \times 2$ (*T. moschata*).

Except in *T. europaea*, the eyes are covered by a membrane. In *T. micrura* the short tail is concealed by the fur. *T. europaea* extends from England to Japan.

T. caeca and *T. romana* are found south of the Alps, the remaining species are all Asiatic, two only—*T. micrura* and *T. leucura*—occurring south of the Himalaya.

The genus may be split up into subgenera corresponding with the above table; these subdivisions being sometimes accorded full generic rank. For instance the Japanese *T. wogura* and the Siberian *T. robusta* are often referred to under the ill-sounding titles of *Mogera wogura* and *M. robusta*.

Referring more fully to the European species, it may be mentioned that the mole exhibits in its organization perfect adaptation to its mode of life. In the structure of the skeleton striking departures from the typical mammalian forms are noticeable. The first sternal bone is so much produced as to extend forward as far as a vertical line from the second cervical vertebra, carrying with it the very short almost quadrate clavicles, which are articulated with its anterior extremity and externally with the humeri, being also connected ligamentously with the scapula. The fore-limbs are thus brought opposite the sides of the neck, and from this position a threefold advantage is derived:—in the first place, as this is the narrowest part of the body, they add little to the width, which, if increased, would lessen the power of movement in a confined space; secondly this position allows of a longer fore-limb than would otherwise be possible, and so increases its lever power; and, thirdly, although the entire limb is relatively short, its anterior position enables the animal, when burrowing, to thrust the claws so far forward as to be in a line with the end of the muzzle, the importance of which is evident. Posteriorly, we find the hind-limbs removed out of the way by approximation of the hip-joints to the centre line of the body. This is effected by inward curvature of the innominate bones at the acetabulum to such an extent that they almost meet in the centre, while the pubic bones are widely separated behind. The shortness of the fore-limb is due to the humerus, which, like the clavicle, is so reduced in length as to present the appearance of a flattened X-shaped bone, with prominent ridges and deep depressions for the attachments of powerful muscles. Its upper extremity presents two rounded prominences; the smaller, the true head of the bone, articulates as usual with the scapula; the larger, which is the external tuberosity rounded off, forms a separate joint with the end of the clavicle. This double articulation gives the rigidity necessary to support the great lateral pressure sustained by the fore-limb in excavating. The bones of the fore-leg are normal, but those of the fore-foot are flattened and laterally expanded. The great width of the fore-foot is also partly due to the presence of a peculiar bone on the inner side of the palm and articulating with the wrist.

The muscles acting on these modified limbs are homologous with those of cursorial insectivora, differing only in their relative development. The tendon of the biceps traverses a long bony tunnel, formed by the expansion of the margin of the bicipital groove for the insertion of the pectoralis major muscle; the anterior division of the latter muscle is unconnected with the sternum, extending across as a band between the humeri, and co-ordinating the motions of the fore-limbs. The teres major and latissimus dorsi muscles are of immense size, inserted into the prominent ridge below the pectoral attachment, and are the principal agents in the excavating action of the limb. The cervical muscles connecting the slender scapulae, and through them the fore-limbs, with the centre line of the neck and with the occiput are large, and the ligamentum nuchae between them is ossified. The latter condition appears to be due to the prolongation forwards of the sternum, preventing flexion of the head downwards; and, accordingly, the normal office of the ligament being lost, it ossifies,

and affords a fixed point for the origins of the superficial cervical muscles.

The skull is long, with slender zygomatic arches; the nasal bones are strong and early become united, and in front of them the nostrils are continued forwards in tubes formed of thick cartilage, the septum between which becomes partially or wholly ossified beneath. There are 7 cervical, 13 dorsal, 6 lumbar, 6 sacral and 10-12 caudal vertebrae; of the dorsal and lumbar there may be one more or less. The sacral vertebrae are united by their expanded and compressed spinous processes, and all the others, with the exception of the cervical, are closely and solidly articulated together, so as to support the powerful propulsive and fossorial actions of the limbs. The upper incisors are simple chisel-edged teeth; the canine is long and two-rooted; then follow three subequal conical premolars, and a fourth, much larger, and like a canine; these are succeeded by three molars with W-shaped cusps. In the lower jaw the three incisors on each side are slightly smaller, and slant more forwards; close behind them is a tooth which, though like them, must, from its position in front of the upper canine, be considered as the canine; behind it, but separated by an interval, is a large double-rooted conical tooth, the first premolar; the three following premolars are like the corresponding teeth above, but smaller, and are succeeded, as above, by the three molars. See MOLE.

In the other members of the *Talpinae*, which are North American, the first upper incisor is much taller than the second. They include the curious star-nosed mole (*Condylura cristata*), which has the typical series of 44 teeth and a series of fleshy appendages round the extremity of the snout; the species known as *Scapanus townsendi*

FIG. 4.—Russian Desman (*Myogale moschata*). ×⅙.

and *Parascalops americanus*, each representing a genus by itself, and characterized by the absence of nasal appendages and the presence of only two pairs of lower incisors; and, finally, *Scalops aquaticus*, in which the dentition is further reduced by the loss of the lower canine, the total number of teeth thus being forty.

Forming a transition to the subfamily *Myogalinae*, in which the clavicle and humerus are typically of normal form, and there is no sickle-shaped bone in the fore-foot, is the Chinese mole (*Scaptonyx piscicauda*), characterized by having the clavicle and humerus of the true mole-type, but the foot like that of the under-mentioned *Urotrichus*. The relative proportions of the first and second upper incisors are also as in *Talpa*, but there are only two pairs of lower incisors.

Among the more typical *Myogalinae*, mention may be made of *Dymecodon pilirostris*, from Japan, representing a genus by itself; nearly allied to which are the shrew-moles, as represented by the small and long-tailed *Urotrichus* of Japan, with incisors $\frac{2}{1}$ and premolars $\frac{4}{3}$, and *U.* (*Neurotrichus*) *gibbsi* of North America, in which the premolars are $\frac{3}{4}$. A still more interesting form is the Tibetan *Uropsilus soricipes*, a non-burrowing species, with the external appearance of a shrew combined with the skull of a mole, the feet being much narrower than in *Urotrichus*, and the dental formula *i.* $\frac{2}{1}$, *c.* $\frac{1}{1}$, *p.* $\frac{3}{3}$, *m.* $\frac{3}{3}$.

The typical representatives of the subfamily are the two European desmans, *Myogale moschata* and *M. pyrenaica*, which are aquatic in habits and have the feet webbed and the full series of 44 teeth. The former is by far the largest member of the whole family, its total length being about 16 in. Its long proboscis-like snout projects far beyond the margin of the upper lip; the toes are webbed as far as the bases of the claws; and the long scaly tail is laterally flattened, forming a powerful instrument of propulsion when swimming. This species inhabits the banks of streams and lakes in south-east Russia, where its food consists of various aquatic insects. *M. pyrenaica*, living in a similar manner in the Pyrenees, is much smaller, has a cylindrical tail, and a relatively long snout.

Shrews.

The Shrew-mice, or, shortly, shrews (*Soricidae*), are closely related to the *Talpidae*, with which they are connected by means of some of the subfamily *Myogalinae*. They are, however, distinguished by the ring-like tympanic, the incompleteness of the zygomatic arch, the tubercular-sectorial type of upper molar, the two-cusped first upper incisor, and the forward direction of the corresponding lower tooth. As a rule they are terrestrial, but a few are aquatic.

The dentition (fig. 5) is characteristic, and affords one of the chief means of classifying this exceedingly difficult group of mammals. There are no lower canines, and always six functional teeth on each side of the lower jaw, but in some rare instances an additional rudimentary tooth is squeezed in between two of the others. The first pair of teeth in each jaw differ from the rest; in the upper jaw they are hooked and have a more or less pronounced basal cusp; in the lower jaw they are long and project horizontally forwards, sometimes with an upward curve at the tip. Behind the first upper incisor comes a variable number of small teeth, of which, when all are developed, the first two are incisors, the third the canine, and the next two premolars; behind these, again, are four larger teeth, of which the front one is the last premolar, while the other three are molars. Thus we have in the typical genus *Sorex* (fig. 5) the dental formula *i.* $\frac{3}{2}$, *c.* $\frac{1}{0}$, *p.* $\frac{3}{1}$, *m.* $\frac{3}{3}$, total 32, or twenty upper and twelve lower teeth. The lower formula, as already stated, is constant, but the number of the upper series varies from the above maximum of twenty to a minimum of fourteen in *Diplomesodon* and *Anurosorex*, in which the formula is *i.* 2, *c.* 1, *p.* 1, *m.* 3. From the relation of the fourth upper tooth to the premaxillo-maxillary suture it has been supposed that shrews, like many polyprotodont marsupials, have four pairs of upper incisors; but this is improbable, and the formula is accordingly here taken to follow the ordinary placental type.

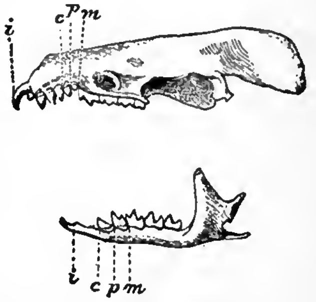

FIG. 5.—Skull and Dentition of a Shrew-mouse (*Sorex-veraepacis*); *i*, first incisors; *c* in the upper jaw is the canine; and *p-m* the three premolars, behind which are the three molars; in the lower jaw *c* is the second incisor, and *p* the single premolar.

Shrews may be divided into two sections, according as to whether the teeth are tipped with brownish or reddish or are wholly white, the former group constituting the *Soricinae* and the latter the *Crocidurinae*.

In the red-tipped group is the typical genus *Sorex*, which ranges over Europe and Asia north of the Himalaya Mountains to North America. There are twenty upper teeth with the formula given above, the ears are well developed, the tail is long and evenly haired, and the aperture of the generative organs in at least one of the sexes is distinct from the vent. The common shrew-mouse (*Sorex araneus*) has a distribution co-extensive with that of the genus in the Old World, and the North American *S. richardsoni* can scarcely be regarded as more than a local race. A few species, such as *Sorex hydrodomus* of Alaska and *S. palustris* of the United States, have fringes of long hairs on the feet, and are aquatic in habit. The latter has been made the type of the genus *Neosorex*, but such a distinction, according to Dr J. E. Dobson, is unnecessary. The same authority likewise rejects the separation of the North American *S. bendirei* as *Atophyrax*, remarking that this species is an inhabitant of marshy land, and appears to present many characters intermediate between *S. palustris* and the terrestrial species of the genus, differing from the former in the absence of well-defined fringes to the digits, but agreeing with it closely in dentition, in the large size of the infra-orbital foramen, and in the remarkable shortness of the angular process of the lower jaw. In India and Burma the place of *Sorex* is taken by *Soriculus*, in which the upper teeth are generally 18, although rarely 20, and the generative organs have an opening in common with the vent after the fashion of the monotreme mammals. The latter feature occurs in the North American *Blarina*, which is characterized by the truncation of the upper part of the ear and the short tail, the number of upper teeth being 20 or 18. Another American genus, *Notiosorex*, in which the ear is well developed and the tail medium, has only 16 upper teeth. From all the rest of the red-toothed group the water-shrew, *Neomys* (or *Crossopus*) *fodiens*, of Europe and northern Asia, differs by the fringe of long hairs on the lower surface of the tail; the number of upper teeth being 18.

In the white-toothed, or crocidurine, group, the small African genus *Myosorex*, which has either 18 or 20 upper teeth, includes long-tailed and large-eared species in which the aperture of the generative organs and the vent, although close together, are yet distinct. In the musk-shrews (*Crocidura*), on the other hand, which are common to Europe, Asia and Africa, the reproductive organs and the alimentary canal discharge into a common cloaca, the long tail is sparsely covered with long and short hairs, there are anal glands secreting a strong musky fluid, and the number of upper teeth is 16 or 18. *Diplomesodon pulchellus* of the Kirghiz steppes, has, on the other hand, only 14 upper teeth, and is further characterized by the moderately long tail and the hairy soles of the hind-feet. Another genus is represented by the Tibetan *Anurosorex squamipes*, which has the same dental formula, but a mole-like form, rudimentary tail and scaly hind-soles. Lastly, we have two Asiatic mountain aquatic species, *Chimarrogale himalayaca* of the Himalayas and *Nectogale elegans* of Tibet, which have fringed tails like the European water-shrew, and 16 upper teeth, the former characterized by the small but perfect external ears, and the latter (fig. 6) by the absence of the ears and presence of adhesive disks on the feet.

It will be seen that the red- and the white-toothed series have parallel representative forms, which may indicate that the division of the family into the two groups is one based rather on convenience than on essential differences. See SHREW.

From the shrews, the hedgehogs and gymnuras, or rat-shrews, collectively forming the family *Erinaceidae*, differ structurally by the broader ring made by the tympanic, the complete zygomatic arch, the five-cusped broad upper molars, and the presence of a short

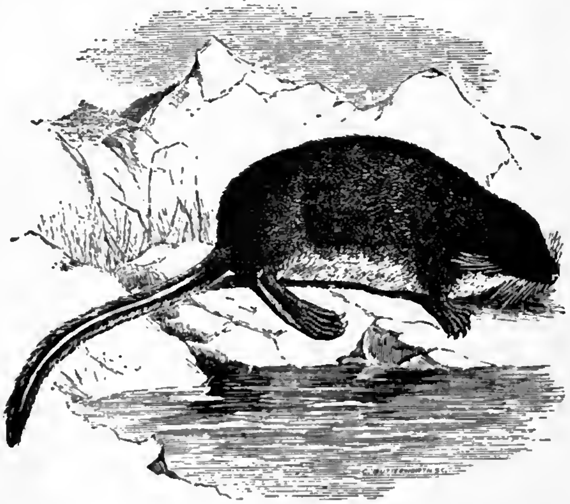

FIG. 6.—The Tibetan Water-shrew (*Nectogale elegans*).

pubic symphysis. At the present day they are an exclusively Old World group.

Hedgehogs. The typical group, or *Erinaceinae*, is represented only by the hedgehogs, with the one genus *Erinaceus*, easily recognized by their spiny coats, and further characterized by the rudimentary tail, the presence of vacuities in the palate, and the broad pelvis. Hedgehogs (*Erinaceus*) have the dental formula *i.* $\frac{3}{2}$, *c.* $\frac{1}{1}$, *p.* $\frac{3}{2}$, *m.* $\frac{3}{3}$, and are represented by over a score of species, distributed throughout Europe, Africa and the greater part of Asia, but unknown in Madagascar, Ceylon, Burma, Siam, the Malay countries, and, of course, Australia. All the species resemble one another in the armour of spines covering the upper surface and sides of the body; and all possess the power of rolling themselves up into the form of a ball protected on all sides by these spines, the skin of the back being brought downwards and inwards over the head and tail so as to include the limbs by the action of special muscles.

Curiously enough the European hedgehog (*E. europaeus*) is the most aberrant species, differing from all the rest in the peculiarly-shaped and single-rooted third upper incisor and first premolar (fig. 7, A), and in its very coarse harsh fur. The dentition of the long-eared Indian *E. grayi* (fig. 7, B) may, on the other hand, be considered characteristic of all the other species, the only important differences being found in the variable size and position of the second upper premolar, which is very small, external and deciduous in the Indian *E. micropus* and *E. pictus*. The former species, limited to South India, is further distinguished by the absence of the jugal bone. Of African species, *E. diadematus*, with long frontal spines, is probably the commonest, and *E. albiventris* has been made the type of a separate genus on account of the total absence of the first front-toe. See HEDGEHOG.

Rat-shrew. The members of the second subfamily, *Gymnurinae*, are more or less rat-like animals, confined to the Malay countries, and easily distinguished from the hedgehogs by the absence of spines among the fur and the well-developed tail. They also lack vacuities in the palate, and have a long and narrow pelvis. The typical representative of the family is the greater rat-shrew, or greater gymnura (*Gymnura rafflesi*) a creature which may be compared to a giant shrew, and whose colour is partly black and partly white, although a uniformly pale-coloured race. (*G. r. alba*) inhabits Borneo. In common with the next genus, it has the full series of 44 teeth; and its range extends from Tenasserim and the Malay Peninsula to Sumatra and Borneo, the island individuals being stated to be considerably larger than those from the mainland. In this species the length of the tail is about three-fourths that of the head and body; but in the lesser rat-shrew (*Hylomys suillus*), ranging

A

B

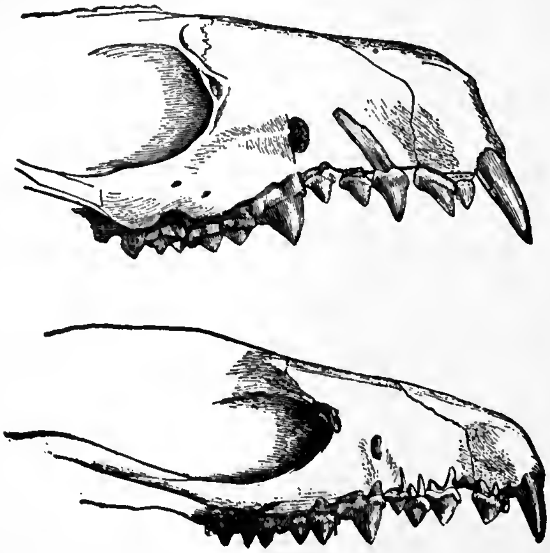

FIG. 7.—Fore-part of Skulls of Common Hedgehog (*Erinaceus europaeus*), A, and Gray's Hedgehog (*E. grayi*), B, much enlarged.

from Burma and the Malay Peninsula to Java and Sumatra, the former dimension is only about one-sixth of the latter. In the Philippines the group is represented by *Podogymnura truei*, distinguished from the other genera by the great elongation of the hind-foot, the tail being likewise long. There are only three pairs of premolars in each jaw.

Insectivorous Otter. In the remaining families of the Insectivora the tibia and fibula may be either separated or united at the lower end; there is no descent of the testes, except in *Solenodon*; a short symphysis is formed by the junction of the pubic epiphyses; and the upper molars are generally small, and triangular, with three cusps arranged in a V. The first family, *Potamogalidae*, is represented by the otter-like *Potamogale velox* of the rivers of West Africa (fig. 8), distinguished from all other

FIG. 8.—The Insectivorous Otter (*Potamogale velox*). × $\frac{1}{6}$.

members of the order by the absence of clavicles. The tibia and fibula are united inferiorly, the skull has a ring-like tympanic, no zygomatic arch, and the upper molars are of the tuberculo-sectorial type, with broader crowns than in the following families. The dental formula is *i.* $\frac{3}{3}$, *c.* $\frac{1}{1}$, *p.* $\frac{3}{3}$, *m.* $\frac{3}{3}$, total 40. This animal inhabits the banks of streams in west equatorial Africa, and its whole structure indicates an aquatic life. It is nearly 2 ft. in length, the tail measuring about half. The long cylindrical body is continued uninterruptedly into the thick laterally compressed tail, the legs are very short, and the toes are not webbed, progression through the water depending wholly on the action of the powerful tail, while the limbs are folded inwards and backwards. The muzzle is broad and flat, and the nostrils are protected by valves. The fur is dark brown above, the extremities of the hairs on the back being of a metallic violet hue by reflected light, beneath whitish.

In the remaining groups the upper molars form narrow V's of the true tritubercular type. The family, *Centetidae*, represented by the tenrec and a number of allied animals from Madagascar, is specially characterized by the ring-like tympanic, and the absence of a zygomatic arch and of any constriction of the skull behind the orbits, and the presence of teats on the breast as well as the abdomen. In the more typical members of the family the tibia and fibula are separate, and, as in hedgehogs, spines are mingled with the fur. The true or great tenrec (*Centetes ecaudatus*), alone representing the typical genus, has the dental formula *i.* $\frac{3 \text{ or } 2}{3}$, *c.* $\frac{1}{1}$, *p.* $\frac{3}{3}$, *m.* $\frac{3 \text{ or } 4}{3 \text{ or } 4}$, total 38, 40, 42 or 44. The fourth lower molar, when developed, does not appear till late in life. Of the long and sharp canines, the tips of the lower pair are received into pits in the upper jaw (fig. 9). The creature grows to a length of about a foot. The

Tenrec.

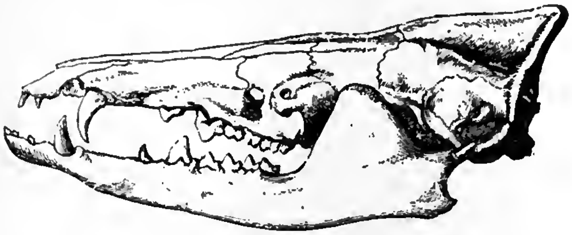

FIG. 9.—Skull of the Tenrec (*Centetes ecaudatus*), somewhat reduced.

young have strong white spines arranged in longitudinal lines along the back, but these are lost in the adult which has only a crest of long rigid hairs on the nape of the neck. The lesser tenrecs, *Hemicentetes semispinosus* and *H. nigriceps*, are distinguished by the persistence of the third upper incisor and the form of the skull. The two species are much smaller than the great tenrec, and spines are retained in the adult on the body. The hedgehog-tenrec, *Ericulus setosus*, has the whole upper surface, and even the short tail, densely covered with close-set spines. The facial bones are much shorter than in the preceding genera, and the first upper incisors are elongated; while there are only two pairs of incisors in each jaw. Judging from the slight development of the cutaneous muscles compared with those of the hedgehog, it would seem that these creatures cannot roll themselves completely into balls in hedgehog-fashion. A second species of this genus, *Ericulus* (*Echinops*) *telfairi*, has two, in place of three, pairs of molars, thus reducing the total number of teeth to 32. Moreover, the zygomatic arches of the skull are reduced to mere threads. Here should perhaps be placed *Geogale aurita*, a small long-tailed Malagasy insectivore, with 34 teeth, and no spines; the tibia and fibula being separate. It has been classed in the *Potamogalidae*, but from its habitat such a reference is improbable.

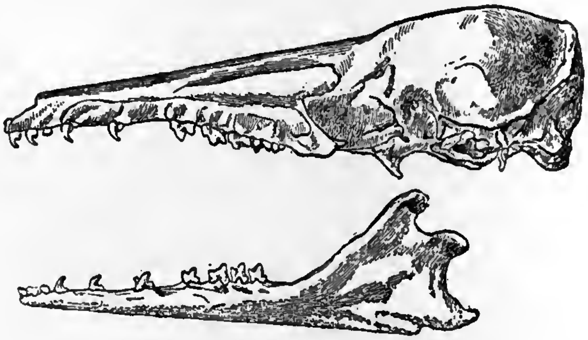

FIG. 10.—Skull of the Lesser Tenrec (*Hemicentetes spinosus*). Twice nat. size.

The absence of spines may entitle it to separation from the *Centetinae*, so that it should perhaps be regarded as representing a subfamily, *Geogalinae*, by itself.

The absence of spines coupled with the union of the tibia and fibula form the leading characteristics of the subfamily *Oryzorictinae*, typified by the rice-tenrecs *Oryzorictes*, of which there are several species. These creatures, which excavate burrows in the rice-fields of Madagascar, are somewhat mole-like in appearance, but have tails of considerable length. In the typical *O. hova* the fore-feet are five-toed, but in *O. tetradactylus* the number of front digits is reduced to four. The long-tailed tenrecs (*Microgale*) are represented by fully half-a-dozen species with tails of great length; that appendage in the typical *M. longicaudata* being more than double the length of the head and body, and containing no fewer than forty-seven vertebrae. The teeth are generally similar to those of *Centetes*, but are not spaced in front; their number being *i.* $\frac{3}{3}$, *c.* $\frac{1}{1}$, *p.* $\frac{3}{3}$, *m.* $\frac{3}{3}$, total 40, or the same as in *Oryzorictes*. Finally, *Limnogale mergulus*, a creature about the size of a black rat, has webbed toes and a laterally compressed tail, evidently adapted for swimming. See TENREC.

All the foregoing are natives of Madagascar. It has been suggested, however, that two remarkable West Indian insectivores, namely *Solenodon cubanus* of Cuba (fig. 11) and *S. paradoxus* of Hayti, should be regarded as representing merely a subfamily of *Centetidae*. It is true that the main features distinguishing these strange creatures from the Malagasy representatives of that family are the constriction of the skull behind the

Solenodon.

FIG. 11.—*Solenodon cubanus*. × $\frac{1}{6}$.

orbits, the descent of the testes into the perineum, and the post-inguinal position of the teats, and that none of these are of very great importance. But the geographical positions of the two groups are so widely sundered that it seems preferable to await further evidence before definitely assigning the two to a single family; and the family *Solenodontidae* may accordingly be retained for the West Indian animals. Solenodons, which look like huge long-nosed, parti-coloured rats, have the tibia and fibula separate, and the same dental formula as *Microgale*. Each of the two species (which differ in colour and the quality of the fur) has a long cylindrical snout, an elongated naked tail, feet formed for running, and the body clothed with long, coarse fur. The position of the teats on the buttocks is unique among Insectivora. The first upper incisors are much enlarged, and like the other incisors, canines and premolars, closely resemble the corresponding teeth of *Myogale*; the second lower incisors are much larger than the upper ones, and hollowed out on the inner side.

The last family, *Chrysochloridae*, is represented by the golden moles of South and East Africa, which differ from the *Centetidae* and *Solenodontidae* by the development of a bulla to the tympanic, and the presence of a zygomatic arch to the skull; the tibia and fibula being separate, and the symphysis of the pelvis formed merely by ligament. The skull is not constricted across the orbits. The teats, which are placed both on the

Golden Mole.

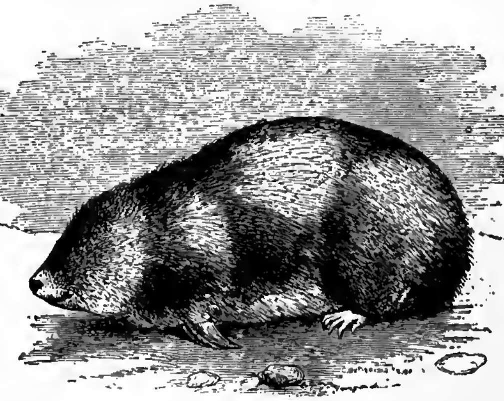

FIG. 12.—A Golden Mole (*Chrysochloris obtusirostris*) reduced.

breast and in the groin, are situated in shallow depressions. The ears are buried in the fur, and the eyes concealed beneath the skin; the feet are four-toed and provided with powerful claws for burrowing in the fashion of the mole, but it is interesting to note that the skeleton is modified for the same purpose in a manner quite different from that obtaining in the latter animal. These animals derive their name from the metallic iridescence of the fur of most of the species. In the more typical species the dental formula is the same as in *Microgale*, that is to say, there are 40 teeth. In other species, which it has been proposed to separate as *Amblysomus*, there are, however, only 36 teeth, owing to the absence of the last pair of molars. The group is evidently nearly related to the *Centetidae*—most nearly perhaps to the *Oryzorictinae*.

Fossil Insectivora.

Some years ago Dr F. Ameghino, of Buenos Aires, described from the Tertiary formation of Santa Cruz, in Patagonia, the remains of an insectivore under the name of *Necrolestes*. The occurrence of a member of the Insectivora in these beds is remarkable, since this group is represented at the present day in South America only by a shrew or two which have wandered from the north. Dr Ameghino expressed his belief that the extinct Patagonian insectivore was nearly related to the golden moles, and although this opinion appears to have been withdrawn, Professor W. B. Scott states that he is convinced of the close affinity existing between *Necrolestes* and *Chrysochloris*. Although this view may not be accepted, it must be remembered that it represents the opinion of a palaeontologist who has had better opportunities than most of his fellow-workers of forming a trustworthy judgment. So convinced is Dr Scott of the closeness of the relationship between *Necrolestes* and the golden moles that he regards it as rendering probable the former existence of a direct land-connexion between Africa and South America. There is no reason, he says, to suppose that the track of migration could have been by way of Europe and North America, for no trace of the group has been found anywhere north of the equator. This supposed connexion between Africa and South America in Tertiary times has often been suggested, and is supported by many independent lines of evidence; and the presumed affinity between the two mammals here referred to adds to the weight of such evidence.

The discovery in the Oligocene Tertiary deposits of Dakota of the remains of a species of hedgehog is a fact of great interest, for the hedgehog-tribe (*Erinaceidae*) is at the present day an exclusively Old World group. The discovery of the fossil American species, which has been made the type of a new genus under the name of *Protherix*, serves to strengthen the view that the northern countries of the Western and Eastern hemispheres form a single zoological region; and that formerly there was comparatively free communication between them in the neighbourhood of Bering Sea, under climatic conditions which permitted of temperate forms passing from one continent to the other. As might have been expected, remains of hedgehog-like mammals have been obtained in the Tertiary deposits of Europe. Among these, *Palaeoerinaceus*, from the Upper Oligocene of France, seems scarcely separable from the existing genus. *Necrogymnurus* (*Neurogymnurus*) from the Lower Oligocene, of the same country, appears to be allied to *Hylomys*, which is itself the most generalised of the family, so that the extinct genus, of which *Caluxotherium* is a synonym, may represent the ancestral type of the *Erinaceidae*. The genus *Galerix*, or *Lanthanotherium*, of the Oligocene, which has the typical series of 44 teeth, a bony ring round the orbit, and conjoint tibia and fibula, has been regarded as representing the *Tupaiidae* and *Macroscelididae*, but is more probably referable to the *Erinaceidae*, being apparently akin to *Gymnura*. The moles are represented in the French Oligocene by *Amphidozotherium* and in the Miocene by *Talpa*, while in the North American early Tertiary we have the primitive *Talpavus*. Shrews are also known from the Lower Oligocene upwards both in the eastern and western hemispheres. Of the Lower Eocene *Adapisorex*, with the typical 22 lower teeth, *Adapisoriculus* and *Orthaspidotherium*, all from France, the affinities are quite uncertain. The American Oligocene *Leptictis*, with *i.* 2, *c.* 1, *p.* 4, *m.* 3 in the upper jaw, and *Ictops*, with *i.* $\frac{3}{2}$, *c.* $\frac{1}{1}$. *p.* $\frac{4}{4}$, *m.* $\frac{3}{3}$, may be insectivorous mammals, with affinities to the creodont Carnivora. It is, indeed, probable that not only is there a relationship between the Creodonta and the Insectivora, but also one between the latter and the Marsupialia, so that the marked similarity between the cheek-teeth of the insectivorous *Chrysochloris* and the Marsupial *Notoryctes* may be due to genetic relationship. That the bats and the flying-lemur are descendants of the Insectivora cannot be doubted.

INSECTIVOROUS PLANTS. Insectivorous or, as they are sometimes more correctly termed, carnivorous plants are, like the parasites, the climbers, or the succulents, a physiological assemblage belonging to a number of distinct natural orders. They agree in the extraordinary habit of adding to the supplies of nitrogenous material afforded them in common with other plants by the soil and atmosphere, by the capture and consumption of insects and other small animals. The curious and varied mechanical arrangements by which these supplies of animal food are obtained and utilized are described under the headings of the more important plants.

The best known and most important order of insectivorous plants—Droseraceae—includes six genera: *Byblis*, *Roridula*, *Drosera*, *Drosophyllum*, *Aldrovanda* and *Dionaea*, of which the last three are monotypic, *i.e.* include only one species. The Sarraceniaceae contain the genera *Sarracenia*, *Darlingtonia*, *Heliamphora*, while the true pitcher plants or Nepenthaceae consist of the single large genus *Nepenthes*. These three orders are closely allied and form the series Sarraceniales of the free-petalled section (Choripetalae) of Dicotyledons. The curious pitcher-plant, *Cephalolus follicularis*, comprises a separate natural order Cephalotaceae, closely allied to the Saxifragaceae. Finally the genera *Pinguicula*, *Ulricularia*, *Genlisea* and *Polypompholix* belong to the gamopetalous order Lentibulariaceae.

While the large genus *Drosera* has an all but world-wide distribution, its congeners are restricted to well-defined and usually comparatively small areas. Thus *Drosophyllum* occurs only in Portugal and Morocco, *Byblis* in tropical Australia, and, although *Aldrovanda* is found in Queensland, in Bengal and in Europe, a wide distribution explained by its aquatic habit, *Dionaea* is restricted to a few localities in North and South Carolina. *Cephalotus* occurs only near Albany in Western Australia, *Heliamphora* on the Roraima Mountains in Venezuela, *Darlingtonia* on the Sierra Nevada of California, and these three genera too are as yet monotypic; of *Sarracenia*, however, there are seven known species scattered over the eastern states of North America. The forty species of *Nepenthes* are mostly natives of the hotter parts of the Indian Archipelago, but a few range into Ceylon, Bengal, Cochin China, and some even occur in tropical Australia on the one hand, and in the Seychelles and Madagascar on the other. *Pinguicula* is abundant in the north temperate zone, and ranges down the Andes as far as Patagonia; the 250 species of *Utricularia* are mostly aquatic, and some are found in all save polar regions; their unimportant congeners, *Genlisea* and *Polypompholix*, occur in tropical America and south-western Australia respectively. It is remarkable that all the insectivorous plants agree in inhabiting damp heaths, bogs, marshes and similar situations where water is abundant, but where they are not brought into contact with the plenteous supply of inorganic nitrogenous food as are the roots of terrestrial plants.

INSEIN, a town of British India, in the Hanthawaddy district of Burma, 10 m. N.W. of Rangoon; pop. (1901) 5350. It is an important railway centre, containing the principal workshops of the Burma railway company, also a government engineering school, a reformatory school and the largest gaol in the province.

INSOMNIA, or deprivation of sleep (Lat. *somnus*), a common and troublesome feature of most illnesses, both acute and chronic. It may be due to pain, fever or cerebral excitement, as in *delirium tremens*, or to organic changes in the brain. The treatment, when failure to sleep occurs in connexion with a definite illness, is part of the treatment of that illness. But there is a form of sleeplessness not occurring during illness to which the term "insomnia" is commonly and conveniently applied. It must not be confounded with occasional wakefulness caused by some minor discomfort, such as indigestion, nor with the "bad nights" of the valetudinarian. Real insomnia consists in the prolonged inability to obtain sleep sufficient in quantity and quality for the maintenance of health. It is a condition of modern urban life, and may be regarded as a malady in itself. It is a potent factor in causing those nervous breakdowns ascribed to "overwork." It may occur as a sequel to some exhausting illness, notably influenza, which affects the nervous system long after convalescence. But it very often occurs without any such cause. Professional and business men are the most frequent sufferers. Insomnia is comparatively rare among the poor, who do little or no brain work. It may be brought on by some exceptional strain, by long-continued worry, or by sheer overwork. The broad pathology is simple enough. It has been demonstrated by exact observations that in sleep the blood leaves the brain automatically. The function is rhythmical, like all the vital functions, and the mechanism by which it is carried out is no doubt the vaso-motor system, which controls the contraction and dilation of the blood-vessels. In sleep the vessels in the brain automatically contract, but when the brain is working actively a plentiful supply of blood is required, and the vessels are dilated. If the activity is carried to great excess the vessels become engorged, the mechanism does not act and sleep is banished. In insomnia this condition has become fixed.

When a breakdown has happened or is pending the only treatment is complete rest, combined, if possible, with change of air and scene; but if the mischief has gone far it will take very long to repair, and may never be repaired at all. In no matter of health is the importance of "taking it early" more pronounced. Delay is the worst economy. A few days' holiday at the commencement of trouble may save months or years of enforced idleness. Sea-air sometimes acts like a charm. But if it is impossible to give up work and leave worry behind, even for a short time, sleep should be carefully wooed by every possible means. In the first place, plenty of time should be devoted to it, and no chance should be missed. That is to say, the night should not be curtailed at either end, and if sleepiness approaches in the daytime, as it often does, it should be encouraged. It is better to lie still at night and try to sleep than to give way to restlessness, and a few minutes snatched in the daytime, when somnolence offers the opportunity, has a restorative effect out of all proportion to the time occupied. Then all accidental causes of disturbance should be avoided. Lights and sounds should be excluded, comfort studied and digestion attended to. Fresh air is a great help. As much time should be spent out of doors as possible, and exercise, even to the point of fatigue, may be found helpful. But this requires watching: in some cases bodily exhaustion aggravates the malady. A little food (*e.g.* a glass of hot milk) immediately before going to bed is useful in inducing sleep, and persons who are apt to wake in the night and lie awake for hours may obtain relief by the same means. Hypnotic drugs, which have greatly multiplied of late years, should only be taken under medical advice. The real end to aim at is the restoration of the natural function, and the substitution of artificial sleep, which differs in character and effect, tends rather to prevent than to promote that end. It is often possible to induce sleep by rhythmic breathing.

INSPIRATION (Lat. *inspirare*, breathe upon or into), strictly the act of drawing physical breath into the lungs as opposed to "expiration." Metaphorically the term is used generally of analogous mental phenomena; thus we speak of a sudden spontaneous idea as an "inspiration." The term is specially used in theology for the condition of being directly under divine influence, as the equivalent of the Greek *θεοπνευστία* (the adjective *θεόπνευστος* is used of the Holy Scriptures in 2 Timothy iii. 16). Similar in meaning is *ἐνθουσιασμός*, enthusiasm (from *ἐνθουσιάζω* from *ἔνθεος*). Possession by the divine spirit (*πνεῦμα*) was regarded as necessarily accompanied by intense stimulation of the emotions. The possibility of a human being becoming the habitation and organ of a divinity is generally assumed in the lower religions. In the popular religion of China some of the priests, the *Wu*, claim to be able to take up into their body a god or a spirit, and thereby to give oracles. In wild frenzy they rush about half naked with hair hanging loose, wounding themselves with swords, knives, daggers, and uttering all kinds of sounds, which are then interpreted by people who claim to be able to understand such divine speech. The Maoris at the initiation of the young men into the tribal mysteries sing a song, called "breath," to the mystic wind by which they believe their god makes his presence known. An Australian woman claimed to have heard the descent of the god as a rushing wind. In some savage tribes blood is drunk to induce the frenzy of inspiration; music and dancing are widely employed for the same purpose. Dionysus, the god of wine in Greece, was also the god of inspiration; and in their orgies the worshippers believed themselves to enter into real union with the deity. In Dephi the Pythia, the priestess who delivered the oracles, was intoxicated by the vapour which rose from a well, through a small hole in the ground. As the oracles were often enigmatic, they were interpreted by a *prophet*. In Rome the inspiration of Numa was derived from the nymph Egeria; and great value was attached to the books of the Cumaean Sibyl. In Arabia the *kahin* (priest) was recognized as the channel of divine communication. Inspiration may mean only possession by the deity, or it may mean further that the person so possessed becomes the channel through which the deity reveals his word and will. (See J. A. Macculloch's *Comparative Theology*, chap. xv., 1902).

Prophecy in the Old Testament in its beginnings is similar to the phenomenon in other religions. Saul and his servant came to Samuel, the man of God, the seer, with a gift in their hands to inquire their way (1 Sam. ix. 8). The companies of prophets who went about the country in Samuel's time were enthusiasts for Yahweh and for Israel. When Saul found himself among them he was possessed by the same spirit (1 Sam. x. 10, 11.) The prophesying in which he took part probably included violent movements of the body, inarticulate cries, a state of ecstasy or even frenzy. The phrase "holy spirit" in Acts, as applied to the Apostolic Church, probably indicates a similar state of religious exaltation; it was accompanied by speaking with tongues, inarticulate utterances, which needed interpretation (1 Corinthians xiv. 27). In every religious revival, when the emotions are deeply stirred, similar phenomena are met with. Such a movement was Montanism in the 3rd century. At the Reformation, while Luther was at the Wartburg, fanaticism broke out, and spread from Wittenberg; prophets went about declaring the revelations which they had received. The Evangelical Revival in the 18th century also had its abnormal religious features. The Revival in Scotland in 1860 was marked by one curious feature—the Gospel dance—when in their excitement men and women got up and spun round and round till they were exhausted. Spontaneous praise and prayer marked the revival in Wales in 1905–1906.

Prophecy, as represented by the writings of the prophets, arose out of this state of religious exaltation, but left behind many of its features. Yahweh was believed to guide and guard the history of His chosen people Israel; He controlled the action of the nations that came in contact with His people, so that, using them as His instruments, He might accomplish His purpose. The function of the prophets was to interpret the course of history so as to communicate God's Word and will in judgment or in mercy. They were divinely endowed for this function by their inspiration. While these prophets seem to have continued in the exercise of all their normal faculties, which were stimulated and not suppressed, yet they do claim a distinctive divine activity in their consciousness, and distinguish with confidence their own thoughts from the revealed word. That abnormal psychic states, such as visions and voices, were sometimes experienced is not improbable; but the usual prophetic state seems to have been one of withdrawal of attention from the outer world, absorption of interest in the inner life, devout communion and intercession with God, and the divine response in a moral or a spiritual intuition rather than an intellectual ratiocination. Possession by the Spirit in its external manifestations is ascribed to Gideon, Jephthah, Samson, Saul, Elijah; but even when the same language is used of the later prophets, it is probably such an inward state as has just been described which is to be assumed. A feature inseparable from this later phase of prophecy is *prediction*. For the warning or the encouragement of the people the prophet as Jehovah's messenger declares what He is about to do. Thus the fall of Samaria in 722 B.C., the deliverance of Jerusalem in 701, the overthrow of the kingdom of Judah in 586, the return from exile in 537 were all heralded by prophecy. This prediction was no shrewd political conjecture, but an application to existing conditions of the permanent laws of God's government. The abnormal phenomena of inspiration, the presence and operation of the Holy Spirit, in the Apostolic Church, have already been noticed. While Paul does not deny nor depreciate these charisms, as tongues, miracles, &c., he represents as the more excellent way the Christian life in faith, hope and love (1 Cor. xii. 31). The New Testament represents the Christian life as an inspired life. It is living communion with Christ, and therefore constant possession of the Holy Spirit.

Every Christian in the measure in which he has become a new creature in Christ is a prophet, because he knows by the enlightening of God's Spirit "what is the good and acceptable and perfect will of God" (Romans xii. 2). An occasional state of divine possession in the other religions becomes in the prophets of Israel a permanent endowment for a few select agents of God's revelation; but when that revelation is consummated in Christ, inspiration becomes the universal privilege of all believers.

While there is much superstition in the view of inspiration found in many religions, and much imposture in the claims to the possession of it, yet it would be illogical to conclude that this feature of religion is altogether human error and not at all divine truth. Man's knowledge of God is conditional, and therefore limited by his knowledge of the world and himself, and has accordingly the same imperfection. The reality of a divine communion and communication with man is not to be denied because its nature has been imperfectly apprehended. We must estimate the worth of inspiration by the higher and not the lower stages, by the vision of an Isaiah or the consecration of a Paul; but at the same time we must be prepared to recognize its lowly beginnings.

In dealing with the inspiration of the Bible, to which the use of the term has in the Christian Church been largely restricted, it is important to remember that inspiration is primarily personal; and that it assumes varied forms and allows varying degrees.

Other religions besides Christianity possess their sacred scriptures. The value attached to the Sibylline writings in Rome has already been mentioned. In Greece, Homer and Hesiod were esteemed as authoritative exponents of the mythology; a distinction was made between the poet's own words and the divine element, and what was offensive to reason, conscience or taste was explained allegorically. Hinduism distinguishes two classes of sacred writings, the *S'ruti* (hearing), which were believed to have been heard by inspired men from a divine source, and were endowed with supernatural powers, and the *Smriti* (recollection) derived from tradition. While the poets of the Rig-Veda, the oldest of the holy writings, do not claim inspiration, it is ascribed to them in the highest degree. Some of the Hindu sects—Vaishnavist and Saivist—regard some of the later writings, as also divine revelation. In Zoroastrianism, the books of the *Zend-Avesta* were conceived by later generations at least as having been eternally formed by Ormuzd, and revealed at the creation to his prophet Zoroaster, who, however, guarded the communication carefully in his mind until a very much later date in the world's history. Ormuzd drove Ahriman back to hell by reciting one of the holy hymns. Buddhism has its *Tripitaka* (three baskets), and the reading, reciting and copying of the sacred scriptures is one of the surest means of acquiring merit. But as it ignores the gods, and places Buddha far above them, it does not claim divine inspiration for its writings. Buddha himself enlightens, but every man must save himself by walking in the true way which has been shown to him. Confucianism has its literature of absolute authority on manners, morals, rites and politics, but its claim does not rest on inspiration. These writings are revered as preserving the beliefs and customs of former ages, which are believed to have been more familiar than the present with the Way of Heaven. For the *Koran* very extravagant claims are made by orthodox Islam. Although Mahomet at first feared that his call to be a prophet was a deception of evil spirits, and wished to take his own life, yet afterwards he uttered his decisions on most trivial matters as divine oracles. God preserves the original text of the *Koran* in Heaven, and blots out what He wills and leaves what He wills. By the angel Gabriel God communicated this book word for word to the prophet, so that the *Koran* is a faithful copy of the heavenly book. The angels in heaven read the *Koran*. While the orthodox theology asserted the eternity of the *Koran*, the Mo'tazilite school denied this for the reason that the spoken sounds and the written signs in which alone a revelation could be given must have come to be in time. As Islam was not altogether independent of Christianity and Judaism, this doctrine of the *Koran* was probably intended as a reply to the claims of Jews and Christians for their holy writings.

The Pentateuch was accepted as authoritative law by the Jewish Church in 444 B.C. About two centuries later the Prophets (including the histories as well as the prophetic writings proper) were also acknowledged as sacred scriptures, although of inferior authority to the Law. In the century before the Christian era the Writings, including Psalms and Proverbs, were included in the Canon. Palestinian and Hellenistic Judaism disagreed about the recognition of the books now known as the Apocrypha. The writers of the New Testament use the Old Testament as holy scriptures, as an authoritative declaration of the mind and will of God; but the inaccuracy of many of the quotations, together with the use of the Greek translation as well as the original Hebrew, forbid our ascribing to them any theory of verbal inspiration. By the middle of the 2nd century the four Gospels were probably accepted as trustworthy records of the life of Jesus. The Epistles were accepted as authoritative in virtue of apostolic authorship. By the end of the 3rd century the use and approval of the churches had established the present canon.

The doctrine of the inspiration of these writings in the Jewish and Christian Church now claims attention. Inspiration is first of all ascribed to persons to account for abnormal states, or exceptional powers and gifts; in this doctrine it is transferred to writings, and its effects in securing for these inerrancy, authority, &c., are discussed with little regard for the psychic state of the writers.

The New Testament affirms the inspiration of the Old Testament. Jesus introduced a quotation from the 110th Psalm with the words "David himself by the Holy Spirit said" (Mark xii. 36), and in appealing to the law against tradition He used the phrase "God said" (Matt. xv. 4). The author of the first Gospel describes a prediction as that "which was spoken by the Lord through the prophet" (Matt. i. 22), and so Peter refers to "the scripture which the Holy Spirit spake before by the mouth of David" (Acts i. 16). For Paul as for Peter the utterances of the Old Testament are "the oracles of God" (Romans iii. 2; 1 Peter iv. 11). The final appeal is to what is written. God spoke in the prophets (Romans ix. 25; Hebrews i. 1). The use of θεόπνευστος in regard to the Scriptures in 2 Timothy iii. 16 has already been noted. The Spirit of Christ is said to have been in the prophets (1 Peter i. 11); and it is affirmed that "no prophecy ever came by the will of man; but men spake from God, being moved by the Holy Spirit" (2 Peter i. 21). The constant use of the Old Testament in the New confirms this doctrine of inspiration. Contemporary Jewish thought was in agreement with this view of the Old Testament. Philo describes Moses as "that purest mind which received at once the gift of legislation and of prophecy with divinely inspired wisdom" (*De congr. crud.* c. 24). Josephus again and again expresses his deep reverence for the holy Scriptures, and his belief that the authors wrote under the influence of the Spirit of God. According to Weber the doctrine of the Talmud is that "the holy scripture came to be through the inspiration of the Holy Spirit, and has its origin in God Himself, who speaks in it." But the nature of this inspiration must be more closely defined, and hence have arisen a number of theories of inspiration.

The first theory is that of *mechanical dictation*, or *verbal inspiration*. The writers of the books of the Bible were God's pens rather than His penmen; every word was given them by God. Their faculties were suppressed that God alone might be active in them. This conception is found in Plato, "God has given the art of divination, not to the wisdom, but to the foolishness of man. No man, when in his wits, attains prophetic truth and inspiration; but when he receives the inspired word, either his intelligence is enthralled in sleep, or he is demented by some distemper or possession" (*Timaeus*, 71). Philo declares that "the understanding that dwells in us is ousted on the arrival of the Divine Spirit, but is restored to its own dwelling when that Spirit departs, for it is unlawful that mortal dwell with immortal" (*Quis rer. div. haeres*, c. 53). Athenagoras adopted this view in regard to the prophets. "While entranced and deprived of their natural powers of reason by the influence of the Divine Spirit, they uttered that which was wrought in them, the spirit using them as its instrument, as a flute player might blow a flute." Other figures used are these; the inspired writer was the lyre, and the Holy Spirit the plectrum, or the writer was the vase, and the Holy Spirit filled it. The extravagances of Montanism threw some discredit on this conception, and we find Miltiades writing a treatise with the title *That the Prophet ought not to speak in Ecstasy.* But Gregory the Great called the writers of Scripture the *calami* of the Holy Spirit. After the Reformation the Protestant Scholastics revived this view. Gerhard, Calovius and Quenstedt agree in ascribing to the Scriptures absolute infallibility in all matters, and describe the writers as "amanuenses of God, or Christ," "hands of the Spirit," "clerks," "secretaries," "manus et Spiritus sive." The *Formula consensus Helvetica* probably reaches the extreme statement, when it declares that the Old Testament was "tum quoad consonas, tum quoad vocalia, sive puncta ipsa, sive punctorum saltem potestatem, et tum quoad res, tum quoad verba θεόπνευστος." Seeing that the vowel-point system was introduced by Jewish scribes centuries after the books were written, this statement shows how recklessly theory may override fact. Of this theory, which has now few advocates, it is sufficient to say that it ignores all the data the Bible itself offers. On the one hand it is impossible to maintain the inerrancy of the Bible in matters of science, philosophy, history, and even in doctrine and morals there is progress; on the other hand the personal characteristics, the historical circumstances, the individual differences of the writers are so reproduced in the writings that the action of the human factor must be frankly and fully recognized as well as the divine activity.

The second theory is that of *dynamic influence or degrees of inspiration.* While the Spirit controls and directs, the human personality is not entirely suppressed. Even Philo recognized that all portions of Scripture were not equally inspired, and assigned to Moses the highest degree of inspiration. The Jewish rabbis placed the Law, the Prophets and the Writings on a descending scale of inspiration. "The schoolmen followed them, and some distinguished four degrees of influence: *superintendence*, which saved from positive error; *elevation*, which imparted loftiness to the thought; *direction*, which prompted the writer what to insert and what to omit; and *suggestion*, which inspired both thoughts and words" (M. Dods, *The Bible, its Origin and Nature*, p. 118, 1905). The co-operation of the divine and the human factors is recognized in Augustine's saying about the authors: "Inspiratus a Deo, sed tamen homo." It is interesting to note that Plutarch had to account for the same human peculiarities and imperfections in the Pythian responses as the Christian apologist in the Bible, and he offers a similar explanation. "If she were obliged to write down, and not to utter the responses, we should not, I suppose, believe the handwriting to be the god's, and find fault with it, because it is inferior in point of calligraphy to the imperial rescripts; for neither is the old woman's voice, nor her diction, nor her metre the god's; but it is the god alone who presents the visions to this woman, and kindles light in her soul regarding the future; for this is the inspiration" (*op. cit.* p. 119). While degrees of inspiration must be recognized, the distinction must be made objectively, and not subjectively. We may say that where the revelation is the clearest, there inspiration is the fullest, that nearness to the perfect fulfilment in Christ of God's progressive purpose determines the degree of inspiration; but we cannot formulate any elaborate theory of the operation of the Spirit from the standpoint of the psychic states of the writers. While subjectively we cannot separate the divine and the human spirit in the process, so objectively we cannot distinguish the divine substance and the human form in the product of inspiration. This theory neither helps us to explain the origin of the writings nor guides us in estimating the contents.

The third theory, which is a modification of the second, is that of *essential inspiration*, which distinguishes *matters of doctrine and conduct* as closely related to God's purpose in the Scriptures from the remaining contents of the Scripture, and claims for the Bible only such inspiration as was necessary to secure accuracy in regard to these. The theology and the morality of the Bible are inspired, but not its history, science, philosophy. This distinction is already anticipated in Thomas Aquinas' theory of two kinds of inspiration, "the *direct*, which is to be found where doctrinal and moral truths are directly taught, and the *indirect*, which appears in historical passages, whence the doctrinal and moral can only be indirectly evolved by the use of allegorical interpretation." This view has the support of such names as Erasmus, Hugo Grotius, Richard Baxter, W. Paley and J. J. I. von Döllinger. It is to be observed that it lays emphasis on the necessity of correct views about doctrine and conduct; and this is an intellectualist standpoint which is not in accord either with the character or the influence of the Bible. Further, it does not explain how the same human mind can by divine inspiration obtain infallible knowledge in some matters, and yet be left prone to err in others. Again it does not take account of the fact that the teaching of the Old Testament as regards belief and morals is progressive; and that the imperfections of the earlier stages of the development are corrected in the later. That it is an advance on the other theories must be acknowledged, as from this standpoint errors in history or science are no difficulties to the believer in the Bible as so inspired. It is necessary here to add that this emphasis on the infallibility of the knowledge of doctrine and morals communicated by the Scriptures had as its legitimate inference in the patristic and medieval period the claim that the Church alone was the infallible interpreter of the Scriptures.

The fourth theory—that of the Reformers (though not of their successors, the Protestant scholastics)—might be called that of *vital inspiration*, as its emphasis is on religious and moral life rather than on knowledge. While giving to the Scriptures supreme authority in all matters of faith and doctrine, the Reformers laid stress on the use of the Bible for edification; it was for them primarily a means of grace for awakening and nourishing the new life in the hearts of God's people. By the enlightening work of the Spirit of God the World of God is discovered in the Scriptures: it is the *testimonium Spiritus Sancti* in the soul of the Christian that makes the Bible the power and wisdom of God unto salvation. By thus laying stress on this redemptive purpose of the divine revelation, the Reformers were delivered from the bondage of the letter of Scripture, and could face questions of date and authorship of the writings frankly and boldly. Hence a pioneer of the higher criticism in Great Britain, W. Robertson Smith, was able to appeal to this Reformation doctrine. "If I am asked why I receive Scripture as the Word of God, and as the only perfect rule of faith and life, I answer with all the fathers of the Protestant Church, 'Because the Bible is the only record of the redeeming love of God, because in the Bible alone I find God drawing near to man in Christ Jesus, and declaring to us in Him His will for our salvation. And this record I know to be true by the witness of His Spirit in my heart, whereby I am assured that none other but God Himself is able to speak such words to my soul'" (in Denney's *Studies in Theology*, p. 205). The Reformers' application of this theory to the Bible was necessarily conditioned by the knowledge of their age; but it is a theory wide enough to leave room for our growing modern knowledge of the Bible.

Briefly stated, these are the conclusions which our modern knowledge allows. (1) Inspiration, or the presence and influence of the Divine Spirit in the soul of man, cannot be limited to the writers of the Scriptures; but, comparing the Bible with the other sacred literature of the world, its religious and moral superiority cannot be denied, and we may, therefore, claim for it as a whole a fuller inspiration. (2) As different writings in the Bible have more or less important functions in the progressive divine revelation, we may distinguish degrees of inspiration. (3) This inspiration is primarily personal, an inward enlightening and quickening, both religious and moral, of the writer, finding an expression conditioned by his individual characteristics in his writing. (4) The purpose of inspiration is practical; the inspired men are used of God to give guidance in belief and duty by declaring the word and will of God as bearing on human life. (5) As revelation is progressive, inspiration does not exclude defects in doctrine and practice in the earlier stages and their correction in the later stages of development. (6) As the progressive revelation culminates in Christ, so He possesses fullest inspiration; and it varies in others according to the closeness of their contact, and intimacy of their communion with Him. (7) As the primary function of Christ is redemptive, so the inspiration of the Bible is directed to make men "wise unto salvation." (8) It is the presence and influence in the souls of men of the same Spirit of God as inspired the Scriptures which makes the Bible effective as a means of grace; and only those who yield themselves to the Spirit of God have the witness in themselves that the Bible conveys to them the truth and the grace of God.

Davidson, article "Prophecy" in Hastings's *Bible Dictionary*, iv.; A. E. Garvie, "Revelation" in Hastings's *Bible Dictionary* (extra volume). (A. E. G.*)

INSTALLATION, the action of installing or formally placing some one in occupation of an office or place. The med. Lat. *installare* meant literally "to place in a seat or stall" (*stallum*), and the word, as now, was particularly used of the ceremonial induction of an ecclesiastic, such as a canon or prebendary, to his stall in his cathedral choir. Similarly knights of an order of chivalry are ceremonially led to their stalls in the chapel of their order. The term is transferred to any formal establishment in office or position. From a French use of *installer* and *installation*, the word is frequently applied in a transferred sense to the fixing in position and making ready for use of a mechanical, particularly electrical, apparatus or plant.

INSTALMENT (for earlier *stallment* or *estallment*, from Fr. *estaler*, to fix, arrange; the change is probably due to the influence of the verb "install"), the payment of a sum of money at stated intervals and in fixed portions instead of in a lump sum; hence the sums of money as they fall due at the periods agreed upon. For the system of purchase by deferred payments or instalments see HIRE-PURCHASE AGREEMENT.

INSTERBURG, a town in the kingdom of Prussia, situated at the point where the Angerapp and Inster join to form the Pregel, 57 m. E. of Königsberg by the railway to Eydtkuhnen, and at the junction of lines to Memel and Allenstein. Pop. (1900) 27,787. It has four Evangelical churches, of which the town church is celebrated for its fine wood carvings, a Roman Catholic church, a synagogue, several schools and a park. Besides flax-spinning and iron-founding, Insterburg has manufactures of machinery, shoes, cement, leather and beer, along with a considerable trade in cereals, vegetables, flax, linseed and wood, while horse-breeding is extensively carried on in the neighbourhood. Close to the town lies the demesne of Georgenburg, with an old castle which formerly belonged to the Teutonic order. Insterburg, the "burg" on the Inster, was founded in the 14th century by the knights of the Teutonic order. Having passed to the margraves of Brandenburg, the village which had sprung up round the castle received civic privileges in 1583. During the next century it made rapid advances in prosperity, partly owing to the settlement in it of several Scottish trading families. In 1679 it was besieged by the Swedes; in 1690 it suffered severely from a fire; and in 1710–1711 from pestilence.

See Töws, *Urkunden zur Geschichte des Hauptamts Insterburg* (Inst., 1895–1897, 3 parts); and *Kurze Chronik der Stadt Insterburg* (Königsberg, 1883).

INSTINCT. It is in the first place desirable to distinguish between the word "instinct" (Lat. *instinctus*, from *instinguere*, to incite, impel) as employed in general literature and the term "instinct" as used in scientific discourse. The significance of the former is somewhat elastic, and is in large measure determined by the context. Thus in social relationships we speak of "instinctive" liking or distrust; we are told that the Greeks had "instinctive" appreciation of art; we hear of an instinct of reverence or "instinctive" beliefs. We understand what is meant and neither desire nor demand a strict definition. But in any scientific discussion the term instinct must be used within narrower limits, and hence it is necessary that the term should be defined. There are difficulties, however, in framing a satisfactory definition. That given by G. J. Romanes in the 9th edition of the *Encyclopaedia Britannica* runs as follows: "Instinct is a generic term comprising all those faculties of mind which lead to the conscious performance of actions that are adaptive in character but pursued without necessary knowledge of the relation between the means employed and the ends attained." This has been criticized both from the biological and from the psychological standpoint. From the biological point of view the reference of certain modes of behaviour, termed instinctive, to faculties of mind for which "instinct" is the generic term is scarcely satisfactory; from the psychological point of view the phrase "without necessary knowledge of the relation between the means employed and the end attained" is ambiguous. (See INTELLIGENCE OF ANIMALS.) In recent scientific literature the term is more frequently used in its adjectival than in its substantive form; and the term "instinctive" is generally applied to certain hereditary modes of behaviour. Investigation thus becomes more objective, and this is a distinct advantage from the biological point of view. It is indeed sometimes urged that instinctive modes of behaviour should be so defined as to entirely exclude any reference to their psychological concomitants in consciousness, which are, it is said, entirely inferential. But as a matter of fact no small part of the interest and value of investigations in this field of inquiry lies in the relationships which may thereby be established between biological and psychological interpretations. Fully realizing, therefore, the difficulty of finding and applying a criterion of the presence or absence of consciousness, it is none the less desirable, in the interests of psychology, to state that truly instinctive acts (as defined) are accompanied by consciousness. This marks them off from such reflex acts as are unconsciously performed, and from the tropisms of plants and other lowly organisms. There remains, however, the difficulty of finding any satisfactory criterion of the presence of consciousness. We seem forced to accept a practical criterion for purposes of interpretation rather than one which can be theoretically defended against all adverse criticism. We have reason to believe that some organisms profit by experience and show that they do so by the modification of their behaviour in accordance with circumstances. Such modification is said to be individually acquired. To profit by individual experience is thus the only criterion we possess of the existence of the conscious experience itself. But if hereditary behaviour is unaccompanied by consciousness, it can in no wise contribute to experience, and can afford no data by which the organism can profit. Hence, for purposes of psychological interpretation it seems necessary to assume that instinctive behaviour, including the stimulation by which it is initiated and conditioned, affords that naive awareness which forms an integral part of what may be termed the primordial tissue of experience.

Conscious concomitant.

We are now in a position to give an expanded definition of instinctive behaviour as comprising those complex groups of co-ordinated acts which, though they contribute to experience, are, on their first occurrence, not determined by individual experience; which are adaptive and tend to the well-being of the individual and the preservation of the race; which are due to the co-operation of external and internal stimuli; which are similarly performed by all members of the same more or less restricted group of animals; but which are subject to variation, and to subsequent modification under the guidance of individual experience.

If a brief definition of instinct, from the purely biological point of view be required, that given in the *Dictionary of Philosophy and Psychology* may be accepted: "An inherited reaction of the sensori-motor type, relatively complex and markedly adaptive in character, and common to a group of individuals." Instinctive behaviour thus depends solely on how the nervous system has been built through heredity; while intelligent behaviour depends also on those characters of the nervous system which have been acquired under the modifying influence of individual relation to the environment.

Definitions.

Such definitions, however, are not universally accepted. Wasmann, for example, divides instinctive actions under two groups: (1) those which immediately spring from the inherited dispositions; (2) those which indeed proceed from the same inherited dispositions but through the medium of sense experience. The first group, which he regards as instinctive in the strict acceptance of the term, seem exactly to correspond to those which fall under the definition given above. The second group, which he regards as instinctive in the wider acceptance of the term, nearly, if not quite, correspond to those above spoken of as intelligent—though he regards this term as falsely applied (see INTELLIGENCE OF ANIMALS). By using the term instinctive in both its strict and its wider significance, Wasmann includes under it the whole range of animal behaviour.

It will be seen that from the biological standpoint there fall under the stricter definition those hereditary modes of behaviour which are analogous to hereditary forms of structure; and that a sharp line of distinction is drawn between the behaviour which is thus rendered definite through heredity, and the behaviour the distinguishing characteristics of which are acquired in the course of individual life. What in popular usage are spoken of as the instincts of animals, for example, the hunting of prey by foxes and wolves, or the procedure of ants in their nests, are generally joint products of hereditary and acquired factors. Wasmann's comprehensive definition so far accords with popular usage. But it tends to minimize the importance of the distinction of that which is prior to individual experience and that which results therefrom. It is the business of scientific interpretation to disentangle the factors which contribute to the joint-products. It is indeed by no means easy to distinguish between what is dependent on individual experience, and what is not. Only the careful observation of organisms throughout the earlier phases of their life-history can the closely related factors be distinguished with any approach to scientific accuracy. By the patient study of the behaviour of precocious young birds, such as chicks, pheasants, ducklings and moorhens, it can be readily ascertained that such modes of activity as running, swimming, diving, preening the down, scratching the ground, pecking at small objects, with the characteristic attitudes expressive of fear and anger, are so far instinctive as to be definite on their first occurrence—they do not require to be learnt. No doubt they are subsequently guided to higher excellence and effectiveness with the experience gained in their oft-repeated performance. Indeed it may be said that only on the occasion of their initial performance are they purely instinctive; all subsequent performance being in some degree modified by the experience afforded by previous behaviour of like nature and the results it affords. It should be remembered that such comparatively simple activities, though there is little about them to arrest popular attention, are just the raw material out of which the normal active life of such organisms is elaborated, and that for scientific treatment they are therefore not less important than those more conspicuous performances which seem at first sight to call for special treatment, or even to demand a supplementary explanation. The instincts of nest-building, incubation and the rearing of young, though they occur later in life than those concerned in locomotion and the obtaining of food, are none the less founded on a hereditary basis, and in some respects are less rather than more liable to modification by the experience gained by the carrying out of hereditarily definite modes of procedure. Here the instinctive factor probably predominates over that which is experiential. But in the "homing" of pigeons there is little question that the experiential factor predominates. The habit results mainly from the modification of the higher nerve-centres through individual and intelligent use. In the migration of birds we are still uncertain as to the exact nature and proportional value of the instinctive and intelligent factors. The impulse to migrate, that is to say, the calling forth of specific activities by climatal or other presentations, appears to be instinctive; whether the direction of migration is in like manner instinctive is a matter of uncertainty; and, if it be instinctive, the nature of the stimuli and the manner in which they are hereditarily linked with responsive acts is unexplained. To say that it is due to hereditary experience is generally regarded as inadmissible. For modern interpretation hereditary modes of behaviour afford experience; in no other sense can it be said that experience is inherited.

Examples from bird life.

A good example of the methods of recent investigation is to be found in Dr G. W. and Mrs Peckham's minute observations on the habits and instincts of the solitary wasps. They enumerate the following primary types of instinctive behaviour: the manner of attacking and capturing a particular kind of prey which alone affords the requisite presentation to sense; the manner of conveying the prey to the nest; the general style and locality of the nest; the method and order of procedure in stocking the nest with food for the unseen young. It is noteworthy, however, that although the manner in which the prey is stung (for example) is on the whole similar in the case of the members of any given species—that is to say, all the wasps of the species behave in very much the same manner—yet there are minor variations in detail. This outcome of prolonged and careful observation is of importance. It affords a point of departure for the interpretation of the genesis of existing instincts. Furthermore, the observations on American wasps render it probable that the earlier accounts of the instinctive behaviour of such wasps are exaggerated. Romanes thought that the manner of stinging and paralysing their prey might be justly deemed the most remarkable instinct in the world. Spiders, caterpillars and grasshoppers are, he said, stung in their chief nerve-centres, in consequence of which the victims are not killed outright, but rendered motionless and continue to live in this paralysed condition for several weeks, being thus available as food for the larvae when these are hatched. Of course, he adds, the extraordinary fact which stands to be explained is that of the precise anatomical, not to say the physiological, knowledge which appears to be displayed by the insect in stinging only the nerve-centres of its prey. But the Peckhams' careful observations and experiments show that, with the American wasps, the victims stored in the nests are quite as often dead as alive; that those which are only paralysed live for a varying number of days, some more, some less; that wasp larvae thrive just as well on dead victims, sometimes dried up, sometimes undergoing decomposition, as on living and paralysed prey; that the nerve-centres are not stung with the supposed uniformity; and that in some cases paralysis, in others death, follows when the victims are stung in parts far removed from any nerve-centre. It would seem then that by the stinging of insects or spiders their powers of resistance are overcome and their escape prevented; that some are killed outright and some paralysed is merely an incidental result.

Examples from insect life.

Granted that instinctive modes of behaviour are hereditary and definite within the limits of congenital variation, the question of their manner of genesis is narrowed to a clear issue. Do they originate through the natural selection of those variations which are the more adaptive; or do they originate through the inheritance of those acquired modifications which are impressed on the nervous system in the course of individual and intelligent use? Romanes, taking up the inquiry where Darwin left it, came to the conclusion that some instinctive modes of behaviour which he termed "primary" are due to the operation of natural selection alone; that others, which he termed "secondary," and of which he could give few examples, were due to the inheritance of acquired modifications from which, in the phrase of G. H. Lewes, the intelligence had

Mode of origin.

lapsed; while others, which he termed "blended," were partly due to natural selection and partly resulted from the inheritance of acquired habit. There has been a prolonged controversy between the school of interpretation, commonly spoken of as Lamarckian, which advocates a belief in the inheritance of acquired characters, and the school, with Weismann as their leader, which questions the evidence for, or the probability of, such inheritance. The trend of modern opinion appears to be in the direction of the Weismannian interpretation. And it must be regarded as questionable, if not improbable, that instinctive modes of behaviour are in any degree directly due to the inheritance of habits intelligently acquired. That intelligent habits may secure the survival of those organisms whose germ-plasm bears the seeds of favourable congenital variations is not improbable. But in that case intelligent procedure only contributes to the survival and not to the origin of hereditary variations.

To test the hypothesis that natural selection is an essential condition to the genesis of instinctive behaviour it should be the aim of investigation to find crucial cases. This is, however, no easy task. We ought to be able to adduce cases in which, where the incidence of natural selection is excluded, acquired habits do not become instinctive. But it is difficult to do so. It seems, however, that in young chicks drinking from still water is a habit acquired through imitation of the acts of the hen-mother. The presentation of such water to sight does not evoke the appropriate instinctive response, while the presentation of water taken into the bill does at once evoke a characteristic response. Now it would seem that in the former case, since the hen "teaches" all her chicks to peck at the water, she shields them from the incidence of natural selection. But though the hen can lead her young to peck at the water, she cannot "teach" them how to perform the complex movements of mouth, throat and head required for actual drinking. In this matter they are not shielded from the incidence of natural selection. Thus it would seem that, where natural selection is excluded, the habit has not become congenitally linked with a visual stimulus; but where natural selection is in operation, the response has been thus linked with the stimulus of water in the bill.

Crucial observations.

If this interpretation be correct we have here an example of the manner in which imitation plays an important part in the formation of habits which though oft-repeated are not transmitted as hereditary instincts. But the imitative act is itself instinctive. The characteristic feature of the imitative act, at the instinctive level, is that the presentation to sight or hearing calls forth a mode of behaviour of like nature to, or producing like results to, that which affords the stimulus. The nature of instinctive imitation needs working out in further detail. But it is probable that what we speak of as the imitative tendency is, in any given species, the expression of a considerable number of particular responses each of which is congenitally linked with a particular presentation or stimulus. The group of instincts which we class as imitative (and they afford only the foundations on which intelligent imitation is based) are of biological value chiefly, if not solely, in those species which form larger or smaller communities.

Imitation.

The study of instinct is in the genetic treatment of evolutionary science a study in heredity. The favouring bionomic conditions are those of a relatively constant environment under which relatively stereotyped responses are advantageous. If the environment be complex, there is a corresponding complexity in instinctive behaviour. But adjustment to a complex environment may be reached in two ways; by instinctive adaptation through initially stereotyped behaviour; or by plastic accommodation by acquired modifications. The tendency of the evolution of intelligence is towards the disintegration of the stereotyped modes of response and the dissolution of instinct. Natural selection which, under a uniform and constant environment, leads to the survival of relatively fixed and definite modes of response, under an environment presenting a wider range of varying possibilities leads to the survival of plastic accommodation through intelligence. This plasticity is, however, itself hereditary. All intelligent procedure implies the inherited capacity of profiting by experience. Instinctive in the popular sense, it does not fall within the narrower definition of the term; it is more conveniently described as innate. It is important to grasp clearly the distinction thus drawn. A duckling only a few hours old if placed in water swims with orderly strokes. The stimulus of water on the breast may be regarded as a sensory presentation which is followed by a definite and adaptive application of behaviour. But this specific application is dependent upon a prolonged racial preparation of the organism to respond in this particular way. Such response is instinctive. It is wholly due, as such, to racial preparation. Compare the case of a boy who learns to ride a bicycle. This is not wholly due, as such, to racial preparation, but is also partly due to individual preparation. The boy no doubt inherits a capacity for riding a bicycle, otherwise he could never do so. But he has to learn to ride none the less. Individual experience is a condition which without the innate capacity cannot take effect. Instinct involves inherited adaptation; intelligence, an inherited power, embodied in the higher nerve-centres, of accommodation to varying circumstances.

Relation to heredity.

Peckham, *Instincts and Habits of Solitary Wasps* (1898); see also the bibliography (section "Instinct and Impulse") in Baldwin's *Dict. of Philosophy and Psychology*. (C. LL. M.)

INSTITUTE (from Lat. *instituere*, to establish or set up), something established, an institution, particularly any society established for an artistic, educational, scientific or social purpose. The word seems to have been first applied in English to such institutions for the advancement of science or art as were modelled on the great French society, the *Institut National* (see ACADEMIES). It is thus the name of such societies as the Royal Institute of British Architects, the Imperial Institute and the like. It is extended to similar organizations, particularly to educational, on a smaller or local scale, such as Mechanics' or Workmen's Institutes, and is sometimes applied to charitable foundations. In the United States the word is, in a particular sense, applied to periodic classes giving instruction in the principles of education to the teachers of elementary and district schools. The term "institute" is often used to translate the Lat. *institutio*, in the sense of a treatise on the elements of any subject, and particularly of law or jurisprudence; thus the compilation of the principles of Roman law, made by order of the emperor Justinian, is known as *Justinian's Institutes*, and hence Coke's treatise on English law, of which the first part is better known as *Coke upon Littleton*, is called *The Institute*. The same title is borne by Calvin's work on the elements of the Christian doctrine. In Scots law "institute" is the person named in a settlement or testament to whom an estate is first limited; those who follow, failing him, are termed "substitutes."

INSTITUTIONAL CHURCH, the name generally applied both in the British Isles and in America to a type of church which supplements its ordinary work by identifying itself in various ways with the secular interests of those whom it seeks to influence. The idea of such extension of function grew out of the recognition of the fact that the normal activities of church work entirely failed to retain the interest of a large class of the population to whom the ritual formality of ordinary services was unacceptable. Various attempts were made to overcome this deficiency, *e.g.* by modifying the form of service or of some services, by the addition to the ordinary services of more or less informal meetings (*e.g.* the Pleasant Sunday Afternoon services), by specially excusing persons from wearing the normal church-going attire in holiday resorts, and by holding services out of doors. The principle underlying all these changes is systematized in the Institutional Church which, in addition to its main building for specifically religious services, provides other rooms or buildings which during the week are open for the use of members and friends. Lectures, concerts, debates and social gatherings are organized; there are reading rooms, gymnasiums and other recreations rooms; various clubs (cycling, cricket, football) are formed. The organization of the whole is subdivided into special departments managed by committees. By these various means many persons are attracted into the atmosphere of the church's work who could not be induced to attend the formal services.

This expansion of normal church work may be traced back in England to at least as early as 1840, but the full development of the Institutional Church belongs only to the latter years of the 19th century. The chief example in England is Whitefield's Central Mission in Tottenham Court Road, London, a church which, in addition to an elaborate organization on the lines above described, has an official journal. In the United States the movement may be said to date from about 1880. The name "Institutional" was first applied to Berkeley Temple, Boston, by Dr William Jewett Tucker, then president of Dartmouth College. The obvious criticism that this epithet emphasizes the administrative and secular side to the exclusion of the spiritual led to the tentative adoption of other titles, *e.g.* the "Open Church," the "Free Church," the former of which is the more commonly used. In 1894 was formed the "Open and Institutional Church League" at New York, which held a number of conventions and served as a headquarters for the numerous separate churches. In connexion with this league was formed the "National Federation of Churches and Christian Workers," which held a convention in 1905.

See C. Silvester Horne, *The Institutional Church* (London, 1906); G. W. Mead, *Modern Methods in Church Work* (New York, 1897); R. A. Woods, *English Social Movements* (New York, 1891).

INSTRUMENT (Lat. *instrumentum*, from *instruere*, to build up, furnish, arrange, prepare), that which can be used as a means to an end, hence a mechanical contrivance, implement or tool; the word is more particularly applied to the implements of applied science, in mathematics, surgery, surveying, &c., while those of the handicrafts are generally known as "tools." A specific use of the term is for the various contrivances used to produce musical sounds, "musical instruments."

In law an "instrument" is any formal or written document by which expression is given to a legal act or agreement. This is a classical use of the Lat. *instrumentum*, a document, record. The term may be used in a wide sense, as a mere writing, meant only to form a record, or in a particular sense with reference to certain statutes. For example, the Stamp Act 1891 defines an instrument as an expression including every written document; for the purposes of the Forgery Act 1861 a post-office telegram accepting a wager has been defined as an instrument. In expressions such as "deed, will, or other written instrument" the word means any written document under which a right or liability, legal or equitable, exists.

INSTRUMENTATION. "Instrumentation" is the best term that can be found for that aspect of musical art which is concerned with timbre. The narrower term "orchestration" is applied to the instrumentation of orchestral music. Since the most obvious differences of timbre are in those of various instruments, the art which blends and contrasts timbre is most easily discussed as the treatment of instruments; but we must use this term with philosophic breadth and allow it to include voices. Instrumentation is in all standard text-books treated as a technical subject, from the point of view of practical students desirous of writing for the modern orchestra. And as there is no branch of art in which mechanical improvements, and the consequent change in the nature of technical difficulties, bear so directly upon the possibilities and methods of external effect, it follows that an exclusive preponderance of this view is not without serious disadvantage from the standpoint of general musical culture. There is probably no other branch of art in which orthodox tradition is so entirely divorced from the historical sense, and the history, when studied at all, so little illuminated by the permanent artistic significance of its subjects. When improvements in the structure of an instrument remove from the modern composer's memory an entire category of limitations which in classical music determined the very character of the instrument, the temptation is easy to regard the improvement as a kind of access of wisdom, in comparison with which not only the older form of the instrument, but the part that it plays in classical music, is crude and archaic. But we should do better justice to improvements in an instrument if we really understood how far they give it, not merely new resources, but a new nature. And, moreover, those composers who have done most to realize this new nature (as Wagner has done for the brass instruments) have also retained, to an extent unsuspected by their imitators, the definite character which the instrument had in its earlier form.

As it is with mechanical improvements, so is it to a still greater degree with changes in the function of timbre in art. Throughout the 19th century so fatal was the hold obtained on the popular mind by the technical expert's view of instrumentation, that it was impossible to hear the works of Handel and Bach without "additional accompaniments" conceived in terms of art as irrelevant to those of 18th-century polyphonys as the terms of Turnerian landscape are irrelevant to the decoration of the outside walls of a cathedral. There is some reason to hope that the day of these misconceptions is passed; although there is also some reason to fear that on other grounds the present era may be known to posterity as an era of instrumentation comparable, in its gorgeous chaos of experiment and its lack of consistent ideas of harmony and form, only to the monodic period at the beginning of the 17th century, in which no one had ears for anything but experiments in harmonic colour. We do not propose to concern ourselves here with those technical subjects which are the chief concern of standard treatises on instrumentation. Our task is simply to furnish the general reader with an account of the types of instrumentation prevalent at various musical periods, and their relation to other branches of the art.

The Vocal Style of the 16th Century.—In the 16th century instrumentation was, in its normal modern sense, non-existent; but in a special sense it was at an unsurpassable stage of perfection, namely, in the treatment of pure vocal harmony. In every mature period of art it will be found that, however much the technical rules may be collected in one special category, every artistic category has a perfect interaction with all the others; and this is nowhere more perfectly shown than when the art is in its simplest possible form of maturity. Practically every law of harmony in 16th-century music may be equally well regarded as a law of vocal effect. Discords must not be taken unprepared, because a singer can only find his note by a mental judgment, and in attacking a discord he has to find a note of which the harmonic meaning is at variance with that of other notes sung at the same time. Melody must not make more than one wide skip in the same direction, because by so doing it would cause an awkward change of vocal register. Two parts must not move in consecutive octaves or fifths, because by so doing they unaccountably reinforce each other by an amount by which they impoverish the rest of the harmony. Thus we justify, on grounds of instrumentation, laws usually known as laws of harmony and counterpoint. Apart from such considerations, 16th-century vocal harmony shows in the hands of its greatest masters an inexhaustible variety of refinements of vocal colour. A volume might be written on Orlando di Lasso's art of so crossing the voices as to render possible successions of chords which, on a keyed instrument where such crossing cannot be expressed, would be a horrible series of consecutive fifths; the beauty of the device consisting in the extreme simplicity of the chords, combined with the novelty due to the fact that these chords cannot be produced by any ordinary means without incorrectness.

Decorative Instrumentation.—In the 17th century the use of instruments became a necessity; but there were at first no organized ideas for their treatment except those which were grounded on their use as supporting and imitating the voice.

The early 17th-century attempts at their independent use and characterization are historically interesting, but artistically almost barbarous. Sometimes they achieve rare beauty by accident. Heinrich Schütz's *Lamentatio Davidi* is written for a bass voice accompanied by four trombones and organ. The trombone parts are on exactly the same material as the voice, which in fact forms with them a five-part fugue-texture. The effect is magnificent, and admirably suited to the dignity of the trombone. Moreover, the opening theme is formed of slow arpeggios; and the more modern harmonic elements, though technically chromatic, consist, from the modern point of view, rather in swift changes between nearly related keys than in chromatic blurring of the main key. All this, especially in a writer like Schütz, who is saturated with every progressive tendency of the time, seems to point to a deep sense of the appropriate style of trombone writing. Yet, so insensible is Schütz to the euphony of his own work, that he proposes, as an alternative for the first and second trombones, two violins an octave higher, the other parts remaining unaltered! Imagination boggles at the vileness of this effect.

The chief work done in instrumentation in the 17th century is undoubtedly that of the Italian writers for the violin, who developed the technique of that instrument until it proved not only more resourceful but more artistically organized than that of the solo voice, which by the time of Handel had become little better than an acrobatic monstrosity. In the art of Bach and Handel, instrumentation, as distinguished from choral writing, has attained a definite artistic coherence. Choral writing itself has become different from what it was in the 16th century. The free use of discords and of wider intervals, together with the influence of the florid elements of solo-singing, enlarged the bounds of choral expression almost beyond recognition, while they crowded into very narrow quarters the subtleties of 16th-century music. These, however, by no means disappeared; and such devices as the crossing of parts in the second Kyrie of Bach's *B Minor Mass* (bars 7, 8, 14, 15, 22, 23, 50) abundantly show that in the hands of the great masters artistic truths are not things which a change of date can make false.

But the treatment of instruments in Bach and Handel has a radical difference from that of the art which was soon to succeed it. It has precisely the same limitation as the treatment of form and emotion; it cannot change as the work proceeds. Its contrasts are like those of an architectural scheme, not those of a landscape or a drama. It admits of the loveliest combinations of timbre, and it can alternate them in considerable variety. Modern composers have often produced their most characteristic orchestral effects with fewer contrasting elements than Bach uses in his *Trauer-Ode*, in the pastoral symphony in his *Christmas Oratorio*, in the first chorus of the cantata *Liebster Gott, wann werd' ich sterben*, and in many other cases; but the modern instrumental effects are as far outside Bach's scope as a long passage of preparation on the dominant leading to the return of a first subject is beyond the scope of a gigue in a suite. Bach's conception of the function of an instrument is that it holds a regular part in a polyphonic scheme; and his blending of tones is like the blending of colours in a purely decorative design.

Those instruments of which the tones and compass are most suitable for polyphonic melody are for the most part high in pitch; a circumstance which, in conjunction with the practice (initiated by the monodists and ratified by science and common sense) of reckoning chords upwards from the bass, leads to the conclusion that the instruments which hold the main threads in the design shall be supported where necessary by a simple harmonic filling-out on some keyed instrument capable of forming an unobtrusive background. The chords necessary in this part, which with its supporting bass is called the *continuo*, were indicated by figures; and the evanescent and delicate tones of the harpsichord lent themselves admirably to this purpose where solo voices and instruments were concerned. For the support of the chorus the more powerful organ was necessary. It is in the attempt to supply the place of this *continuo* (or *figured bass*) by definite orchestral parts that modern performances, until the most recent times, have shown so radical an incapacity to grasp the nature of 18th-century instrumentation. The whole point of this filling-out is that, the polyphonic design of the main instruments being complete in itself, there is no room for any such additional inner parts as can attract attention. In the interest of euphony some harmonious sound is needed to bridge the great gap which almost always exists between the bass and the upper instruments, but this filling out must be of the softest and most atmospheric kind. Bach himself is known to have executed it in a very polyphonic style, and this for the excellent reason that plain chords would have contrasted so strongly with the real instrumental parts that they could not fail to attract attention even in the softest tones of the harpsichord or the organ, while light polyphony in these tones would elude the ear and at the same time perfectly bridge over the gap in the harmony. There seems no good reason why in modern performances the pianoforte should not be used for the purpose; if only accompanists can be trained to acquire the necessary delicacy of touch, and can be made to understand that, if they cannot extemporize the necessary polyphony, and so have to play something definitely written for them, it is not a mass of interesting detail which they are to bring to the public ear. A lamentable instance of the prevalent confusion of thought on this point is shown by the vocal scores of the Bach cantatas corresponding to the edition of the *Bach Gesellschaft* (which must not be held responsible for them). In these Bach's polyphonic designs are often obliterated beneath a mass of editorial counterpoint (even where Bach has carefully written the words "*tasto solo*," *i.e.* "no filling out"). The same comments apply to the attempts sometimes made to fill out the bare places in 18th-century clavier music. There is no doubt that such filling out was often done on a second harpsichord with stops of a very light tone; but, if it cannot be done on the modern pianoforte in a touch so light as to avoid confusion between it and the notes actually written as essential to the design, it certainly ought not to be done at all. The greater richness of tone of the modern pianoforte is a better compensation for any bareness that may be imputed to pure two-part or three-part writing than a filling out which deprives the listener of the power to follow the essential lines of the music. The same holds good, though in a lesser degree, of the resources of the harpsichord in respect of octave-strings. To sacrifice phrasing, and distinctness in real part-writing, to a crude imitation of the richness produced mechanically on the harpsichord by drawing 4-ft. and 8-ft. registers, is artistically suicidal. The genius of the modern pianoforte is to produce richness by depth and variety of tone; and players who cannot find scope for such genius in the real part-writing of the 18th century will not get any nearer to the 18th-century spirit by sacrificing the essentials of its art to an attempt to imitate its mechanical resources by a modern *tour de force*.

Symphonic Instrumentation.—The difference between decorative and symphonic instrumentation is admirably shown by Gluck. In the famous dedicatory letter of his *Alceste* he mentions among other conceptions on which his reform of opera was to be based, that the co-operation of the instruments ought to be regulated in proportion to the interest and the passion, a doctrine of which the true significance lies in its connexion with other conditions of opera which are incompatible with the polyphonic treatment of instruments as threads in a decorative scheme. The date of this famous letter was 1767, but after *Alceste* Gluck was still able to use material from earlier work; and the overture to *Armide* is adapted from that of *Telemacco*, written in the year of Bach's death (1750).

To write an account of symphonic instrumentation in any detail would be like attempting a history of emotional expression; and all that we can do here is to point out that the problem which was, so to speak, shelved by the polyphonic device of the *continuo*, was for a long time solved only by methods which, in any hands but those of the greatest masters, were very inartistic conventions. In the new art the concentration of attention upon *form*, as a more important source of dramatic interest and climax than *texture*, resulted in a neglect of polyphony which seriously damaged even Gluck's work, and which always had the grave inconvenience that while the new methods of blending and contrasting instruments stimulated an increase in the variety, if not in the size of orchestras, there was at the same time extreme difficulty in finding occupation for the members of the lower middle class of the orchestra in ordinary passages. On the other hand, it is significant how everything in the development of new instruments seems to suggest, and be suggested by, the new methods of expression. The invention of the damper-pedal in the pianoforte epitomizes the difference between polyphony and symphonic art, for it is the earliest device by which sounds are produced and prolonged in a way contrary to the spirit of "real" part-writing. It is possible to conceive of any number of notes struck and sustained by the fingers as consisting of so many quasi-vocal parts; but when a series of single sounds is played and each sound continues to vibrate by means of a pedal which prevents the dampers from falling on the strings, then we are conscious that the sounds have been produced as from one part, and that they nevertheless combine to form a chord; and this is as remote from the spirit of polyphonic part-writing as modern English is from classical Greek.

The pianoforte trios of Haydn are perhaps the only works of first-rate artistic importance in which there is no doubt that the earlier stages of the new art do not admit of sufficient polyphony to give the instruments fair play. Haydn finds the pianoforte so completely capable of expressing his meaning that he is at a loss to find independent material for any accompanying instruments; and the violoncello in his trios has, except perhaps in four passages in the whole collection of thirty-three works, not a note to play that is not already in the bass of the pianoforte; while the melodies of the violin are, more often than not, doubled in the treble. Yet there is a certain difference between this and the work of a poor artist whose designs are threadbare. It would be impossible to add a note to Haydn's trio; the only question is how to account for the superfluity of much of the string parts and how to make the trios effective in performance. It is sometimes suggested that the 'cello part is best omitted and these works played as violin sonatas. But experiment shows that in this condition much of the violin part sounds incomplete; and the truth appears to be that Haydn is thinking, like any modern composer, of the opposition of two solid bodies of tone—the pianoforte and the stringed instruments. And it will be found that the method of performance which most nearly justifies the instrumental effect of these otherwise beautiful works is that in which the pianoforte player regards himself as frequently doubling the stringed instruments, and not vice versa. He should therefore in all such passages play extremely lightly, so as to give the violin and 'cello the function of drawing the main outline. In the time of Bach such writing was beautifully suited to enliven the dry glitter of the harpsichord, and Bach's duets for clavier and violin seem to have been sometimes played as trios with a violoncello playing from the clavier bass. But this was ineffective with the pianoforte, and is only explicable in Haydn as a survival. His trios were, indeed, published under the title of "pianoforte sonatas with accompaniment of violin and violoncello"; but this in no way militates against the above remarks as to their proper method of performance nowadays, when we take into consideration the greater strength of tone of the modern pianoforte, especially in the bass, and the fact that in no case could a violinist consent to play as an accompaniment such melodies as that at the beginning of the G major trio known as No. 1.

For Mozart there never was any such *embarras de richesse* in any combination of instruments. His music is highly polyphonic, and modern in its instrumental treatment throughout. It was lucky for the development of instrumentation (as in all branches of music during the change from polyphonic to formal design) that whenever the texture is not polyphonic the natural place for melody is on the surface: in other words, when the accompaniment is simple the tune is generally on the top. Haydn, when he was not tempted by the resources of an instrument so complete in itself as the pianoforte, soon learnt to write artistically perfect string quartets in which the first violin, though overwhelmingly the most important part, is nevertheless in perfect balance with the other members of the scheme, inasmuch as they contribute exactly what their pitch and the little polyphonic elaboration admissible by the style will enable them to give. In the treatment of the orchestra volumes might be written about Haydn's and Mozart's sense of fitness, as shown in Haydn's experiments and Mozart's settled methods. Where they consent to any practical custom from practical necessity they also consent because it is artistically right for them, and if it had not been artistically right they would have soon swept it away. For example, it has often been said that the extent to which their orchestral viola parts double the basses is due, partly to bad traditions of Italian opera, and partly to the fact that viola players were, more often than not, simply persons who had failed to play the violin. This was in many cases true, and it is equally true that Mozart and Haydn often had no scruple in following the customs of very bad composers. But, when we look at the many passages in which the violas double the basses, we shall do well to consider whether there is room in the harmonic scheme for the violas to do anything else, and whether the effect would not be thin without them. As music becomes more polyphonic the inner parts of the orchestra become more and more emancipated. Already Mozart divides his violas into two parts quite as often as he makes them play with the basses. In Beethoven's orchestration there is almost always room for an independent viola part. There is not room for one together with an independent violoncello part; the wonderful use of muted solo violoncellos in the slow movement of the *Pastoral Symphony* being a special effect, like the earlier instance in Haydn's 12th *Salomon Symphony*. Otherwise, when Beethoven has anything special for the violoncellos to say, he invariably softens and deepens their singularly incisive cantabile tones by doubling them with the violas. In the orchestras of his day this was perhaps the only safe proceeding for players unaccustomed to such responsibilities, and that may have been one of Beethoven's reasons for it. But it is equally certain that the pure violoncello tone in large masses belongs to a distinctly different region of orchestral effect. Haydn's numerous examples of independent violoncello melodies are almost all either marked *solo* or written for such small orchestras that they would be played as solos.

Similar principles apply in infinite detail to the treatment of wind instruments, and we must never lose sight of them in speculating as to the reasons why the genius of Beethoven was able to carry instrumentation into worlds of which Haydn and Mozart never dreamt, or why, having gone so far, it left anything unexplored. A subject so vast and so incapable of classification cannot be discussed here, but its aesthetic principles may be illustrated by the extreme case of the trumpets and horns, which in classical times had no scale except that of the natural harmonic series. This could be fixed, within certain limits, at whatever pitch suited the composition; but on the horn it could be only very partially filled out by notes of a muffled quality produced by inserting the hand into the bell of the instrument, a device impossible on the trumpet. These instruments thus produced, in Haydn's and Beethoven's times, a very remarkable but closely limited series of effects, which, as Sir George Macfarren pointed out in the article "Music" in the 9th edition of the *Encyclopaedia Britannica*, gave them a peculiar character and function in strongly asserting the main notes of the key. An instance of this characteristic function, specially remarkable because the composer has taken exceptional measures for it, is Beethoven's overture to *Fidelio*. It is in E major, while Beethoven chooses to use trumpets in C. The only note which these can play in E major is the tonic, to which they are accordingly confined until the recapitulation of the second subject. This is unexpectedly placed in C major, the remotest key reached in the overture, and one that had already appeared in an impressive passage in the introduction which foreshadows the reference in the first act to the hero in his dungeon ("Der kaum mehr lebt und wie ein Schatten schwebt"). In this key the trumpets blaze out with an effect which entirely depends upon their restricted part hitherto. On a sufficient acquaintance with the work this would probably have revealed the essential nature of the instrument to a hearer unacquainted with technicalities, and revealed it rather as a characteristic than as a limitation. A still more remarkable instance will be found in the third statement of the theme of the finale of the 9th symphony. When the trumpets take it up they make a remarkable change at its 11th bar, for no other reason than that one of the notes, though perfectly within their scale, and, indeed, already produced by them in the very same bar, is so harmonized as to suggest the freedom of an instrument with a complete scale. This passage shows that if Beethoven had had the modern trumpet at his disposal, while he would no doubt freely have used its resources, he would nevertheless have maintained its character as an instrument founded on the natural scale, and would have agreed with Brahms that the nobility and purity of its tone depends upon its faithful adherence, at least within symphonic limits, to types of melody suggestive of that scale.

This brings us to the latest radical change effected in instrumentation, the change from symphonic to dramatic principles. It will be convenient to take one supreme composer as the artist who has dealt so consistently with the essentials of the new style that he may be conveniently regarded as its creator. Even with this limitation the subject is too vast for us to enter into details.

Dramatic Instrumentation.—There is hardly one of Wagner's orchestral innovations which is not inseparably connected with his adaptation of music to the requirements of drama; and modern conductors, in treating Wagner's orchestration, as the normal standard by which all previous and contemporary music must be judged, are doing their best to found a tradition which in another fifty years will be exploded as thoroughly as the tradition of symphonic additional accompaniments is now exploded in the performances of Bach and Handel. The main difference between symphonic and modern dramatic orchestration depends on this: that in a symphony any important incident will probably be heard again within five minutes, in every circumstance of formal symmetry and preparation that can attract the attention. This being so, it is absurd in a symphony to use only such orchestral colours as would be fit for dramatic moments which are not likely to recur for an hour or two, if they recur at all. Such a passage as bars 5 to 8 in the first movement of Beethoven's 8th symphony is as unintelligible from the point of view of Wagnerian opera as the opening of the *Rheingold* is unintelligible from the point of view of symphony. But both are quite right. The modern Wagnerian conductor is apt to complain that Beethoven, in his four-bar phrase, drowns a melody which lies in the weakest register of the clarinet by a crowd of superfluous notes in oboes, horns and flutes. The complainer entirely overlooks the fact that this is the kind of music in which such a phrase will certainly be heard again before we have time to forget it; and as a matter of fact the strings promptly repeat it *fortissimo* in a position which nothing can overpower. A crowd of instruments that seemed at first to overwhelm it in sympathetic comments is perfectly dramatic and appropriate on the symphonic scale. On the operatic scale established by Wagner such detail is simply lost. Far greater polyphonic detail of another kind is no doubt possible, but it requires far longer time for its expression. It cannot change so rapidly. It engages the ear more exclusively, and therefore it needs an accuracy and an elaboration of paraphernalia quite irrelevant to symphonic art. The accuracy and the paraphernalia are equally exemplified in all Wagner's additions and alterations of the classical orchestral scheme, for these all consist in completing the families of instruments so that each timbre can be presented pure in complete harmony. But the greatness of Wagner is shown in the fact that with all the effect his additions have in revolutionizing the resources of orchestration, he never regards his novelties as substitutes for the natural principles of instrumental effect. His brass instruments have lost nothing of their ancient nobility. In his gigantic designs it inevitably happens that instrumental resources are strained to their utmost, and there is, perhaps, hardly anything which the makers and players of instruments can be trained to do which is too remote to be demanded by some extreme dramatic necessity in Wagner's scheme. But it is always some such extreme necessity that demands it, and never an appetite too jaded for natural resources. The crucial example of this is what Richard Strauss has ingeniously called the "al fresco" treatment of instruments in large orchestral masses (Berlioz-Strauss, *Instrumentationslehre*, edition Peters). Experience shows that in the modern orchestra there is safety in numbers, and that passages may with impunity be written for thirty-two violins which no single player can execute clearly. Whether this justifies Wagner's successors and imitators in showing a constant preference for passages of which not even the general outline is practicable; whether it justifies a state of things in which the normal compass of every instrument in an advanced 20th-century score would appear to be about a fifth higher than any player of that instrument will admit; whether it proves that it is artistically desirable that when there are eight horns in the orchestra their material should be indistinguishable from pianoforte writing, and that, in short, the part of every instrument should look exactly like the part of every other—such questions are for posterity to decide. At present we can only be certain that the criterion according to which Brahms, being a symphonic writer, has no mastery of orchestration whatever, is not a criterion compatible with any sense of symphonic style. It is therefore not a criterion which can do justice to the principles of Wagner's non-symphonic art, for its appreciation thereof is inevitably one-sided. Least of all can it conduce to the formation of sound critical standards for the new instrumentation which is now in process of development for the future forms of instrumental music. These, we cannot doubt, will be as profoundly influenced by Wagner as the sonata style was influenced by Gluck.

Finally it must be remembered that musical euphony and emotional effect are inseparable from considerations of harmony and polyphony. Timbre itself is, as Helmholtz shows, a kind of harmony felt but not heard. Not even the imagination and skill of Berlioz could galvanize into permanent artistic life an instrumentation based exclusively upon instruments, however suggestive his wonderful orchestral effects may have been to contemporary and later artists, who realize that artistic effects must proceed from artistic causes.

Chamber-music—The instrumentation of solo combinations is one of the largest and most detailed subjects in the art of music. Something has been said above as to its earlier aspects in the time of Haydn. Before that time it was based exclusively on the use of the harpsichord either as a means of supporting the other instruments or as also contributing principal parts to the combination. Thus there were no string-quartets before Haydn—at least none that can be distinguished from symphonies for string-band.

Richard Strauss, in his edition of Berlioz's works on *Instrumentation*, paradoxically characterizes the classical orchestral style as that which was derived from chamber-music. Now it is true that in Haydn's early days orchestras were small and generally private; and that the styles of orchestral and chamber-music were not distinct; but surely nothing is clearer than that the whole history of the rise of classical chamber-music lies in its rapid differentiation from the coarse-grained orchestral style with which it began. Orchestral wind-parts have been discovered belonging to Haydn's string-quartet Op. 1, No. 5; his quartet in D minor, Op. 9, No. 4, is already in a style which not even the most casual listener could mistake for anything orchestral. On this differentiation of styles rests the whole aesthetics of chamber-music; but the subject is very subtle, and there is much, as for example in Schubert's quartets and his C major quintet, that is inspired by orchestral ideas without in the least vitiating the chamber-music style; though, judged by its appearance on paper, it seems as unorthodox as the notoriously orchestral beginnings of Mendelssohn's quartet in D and quintet in B♭. The beginning of Mendelssohn's F minor quartet is, again, a case usually, but perhaps wrongly, condemned for its orchestral appearance on paper. Such matters cannot be decided off-hand by the mere fact that *tremolos* are characteristic of orchestras: the question is whether in individual cases they have not a special character when played by single players. Where this is so there need be no confusion of style; but the danger of such confusion is great, and with the rise of modern dramatic instrumentation it may be doubted whether there are any standards of criticism in current use for chamber-music of other than the sonata style. The development of pianoforte technique since Beethoven has been in some ways even more revolutionizing than that of the brass instruments; and pianoforte instrumentation, both in solo and in chamber-music, is a study for a lifetime.

Orchestral Schemes Typical of Different Periods.

1. *16th Century.*—We, with our stereotyped modern notions of the grouping of voices, may get some idea of the freedom of the 16th-century composers' imagination by noting that the four-part movements for semi-chorus or solo voices in Palestrina's Masses present us with no fewer than seventeen different combinations of voices, and that of these the familiar group of soprano, alto, tenor and bass is not the most common, though it is invariable as that used for entire four-part Masses. In three-part movements Palestrina presents us with twelve combinations of voices. In his five-part Masses and single movements we find eight combinations, and his six-part Masses and single movements show eleven. And when he writes in eight parts for a double chorus the two groups are seldom identical.

2. *18th Century.*—17th-century instrumentation may be neglected here as having begun in chaos and ended in the schemes of the 18th-century decorative instrumentation. The following is Bach's fullest orchestra: the string-band, consisting (as at the present day) of violins in two parts, violas, violoncellos, doubled (where the contrary is not indicated) by double basses; the wind instruments (generally one to each part, as the string-band was never large)—2 flutes, 2 or 3 oboes, or *oboe d' amore* (a lower-pitched and gentler type), *taille* or *oboe da caccia* (some kind of alto oboe corresponding to the cor anglais), bassoon, generally doubling the string basses, 2 horns, with parts needing much greater practice in high notes than is customary to-day, 3 (occasionally 4) trumpets, of which at least the first 2 were played by players especially trained to produce much higher notes than are compatible with the power to produce the lower notes (the high players were called *Clarin-Bläser*; and the others *Principal-Bläser*); a pair of kettle-drums, tuned to the tonic and dominant of the piece.

Handel's orchestra is less detailed. He does not seem to have found any English trumpeters capable of playing as high parts as those of the German *Clarin-Bläser*, and his plan seems generally to get as many oboes and bassoons as could be procured to double the top and bottom of his string-band. But his definite orchestral effects in certain places (*e.g.* "He led them forth like sheep," in *Israel in Egypt*, and the music of the *Witch of Endor*, and the appearance of Samuel's spirit in *Saul*) are as modern as Gluck's.

3. *Symphonic Orchestration.*—Mozart's full symphonic scheme requires the string-band, 1 flute (rarely 2), 2 oboes, 2 clarinets (whenever he could obtain them, he being the first composer who really appreciated them, instead of regarding them either as cheap substitutes for the *clarino* or high trumpet of Bach, or, like Gluck and, with rare and late exceptions, Haydn, as merely adding to the force of *tutti* passages). Further, 2 horns, 2 bassoons, 2 trumpets and a pair of kettle-drums.

Mozart imports from church music 3 trombones for special passages in his operas.

Beethoven almost always has 2 flutes, and invariably 2 clarinets. In his 5th symphony he introduced 3 trombones and extended both the upper and lower extremes of the wind-band by a piccolo and a double bassoon. "Turkish music," *i.e.* the big drum, cymbals and triangle, was used by Haydn in his *Military Symphony*, and Mozart in his *Entführung*, for reasons of "local colour"; it appears as an extreme means of climax in the finale of Beethoven's 9th symphony.

4. *Wagner's Orchestra: Tristan und Isolde.*—(Families of instruments are connected by a brace.)

Strings: as usual, but subject to minutely complex grouping.
3 flutes (3rd to play piccolo when required).
{ 2 oboes.
1 cor anglais.
3 bassoons. }
{ 2 clarinets.
1 bass clarinet. }
4 horns. (The mechanical improvements by which horns and trumpets acquired a complete scale have revolutionized the nature of those instruments; and Wagner's orchestration, more than that of any other composer, has profited by this. Yet, in the preface to the score Wagner speaks very strongly of the loss of the original character of the horn in the hands of ordinary players; and goes so far as to say that, if experience had not shown that they could be trained to play *nearly* as smoothly as the classical players, he would have renounced all the advantages of the new mechanism.)
3 trumpets.
3 trombones.
1 tuba.
2 or, for safety in tuning, 3 kettle-drums.
Triangle and cymbals.
1 harp (multiplied *quant. suf.*).

In *Der Ring des Nibelungen* Wagner specifies the proportions of the string-band as 16 first and 16 second violins, 12 violas, 12 violoncellos, 8 double basses. The rest of the orchestra consists of—

Piccolo and 3 flutes.
{ 3 oboes and cor anglais, or 4th oboe.
3 bassoons, or 2 and contra-fagotto. }
3 clarinets and 1 bass clarinet.
8 horns, 4 of whom are also required to play 4 specially constructed tenor and bass tubas.
1 ordinary (double-bass) tuba.
{ 3 trumpets.
1 bass trumpet. (A project of Wagner's which instrument-makers found impracticable, so that Wagner had to content himself with a kind of valve trombone shaped like a trumpet.) }
3 trombones and 1 double-bass trombone.
2 pairs of kettle-drums.
{ Triangle.
Cymbals.
Big drum.
Gong. }
6 harps.

5. *Chamber-music.*—Bach's and his contemporaries' combinations with the harpsichord show the natural fondness, in his day, for instruments of a tone too gentle for prominent use in large rooms, or indeed for survival in modern times. Thus there was quite as much important solo music for the flute as for the violin; and almost more music for the viola da gamba than for the violoncello. A frequent combination was flute, violin and harpsichord (very probably with a violoncello doubling the bass), and in more than one case the violin was partly tuned lower to soften its tone.

Classical and modern chamber-music in the sonata style consists mainly of string-quartets for 2 violins, viola and violoncello; string-trios (rare, because very difficult to write sonorously); pianoforte-trios (pianoforte, violin and violoncello); pianoforte-quartets (pianoforte with string-trio); pianoforte-quintets (pianoforte with string-quartet); string-quintets (with 2 violas, very rarely with 2 violoncellos), and (in two important cases by Brahms) string-sextets. Larger combinations, being semi-orchestral, especially where the double-bass and wind instruments are used, lend themselves to a somewhat lighter style; thus Beethoven's septet and Schubert's octet are both in the nature of a very large serenade.

Wind instruments produce very special effects in chamber-music, and need an exceedingly adroit technique on the part of the composer. Magnificent examples are Mozart's trio for pianoforte, clarinet and viola, his quintet for pianoforte, oboe, clarinet, horn and bassoon (imitated by Beethoven), his quintet for clarinet and strings, Brahms's clarinet-quintet for the same combination, and his trio for pianoforte, violin and horn. (D. F. T.)

INSTRUMENT OF GOVERNMENT, the name given to the decree, or written constitution, under which Oliver Cromwell as "lord protector of the commonwealth" governed England, Scotland and Ireland from December 1653 to May 1657.

The Long Parliament was expelled in April 1653 and the council of state dissolved; the Little, or Nominated, parliament which followed ended its existence by abdication; and Cromwell, officially lord general of the army, with a new council of state, remained the only recognized authority in the country. It was in these circumstances that the Instrument of Government, drawn up by some officers in the army, prominent among whom was John Lambert, was brought forward. The document appears to have been under consideration since the middle of October 1653, but Ludlow says it was "in a clandestine manner carried on and huddled up by two or three persons," a remark probably very near the truth. The nominated parliament abdicated on the 12th of December 1653, and after certain emendations the Instrument was accepted by Cromwell on the 16th. Consisting of forty-two articles, the Instrument placed the legislative power in the hands of "one person, and the people assembled in parliament"; the executive power was left to the lord protector, whose office was to be elective and not hereditary, and a council of state numbering from thirteen to twenty-one members. The councillors were appointed for life;

fifteen were named in the Instrument itself; and Cromwell and the council were empowered to add six. To fill vacancies parliament must name six persons, of whom the council would select two, the choice between these two being left to the protector. A parliament was to meet on the 3rd of September 1654, and until that date the protector with the consent of the council could make ordinances which would have the force of laws. After the meeting of parliament, however, he had no power of legislation, nor had he any veto upon its acts, the utmost he could do being to delay new legislation for twenty days. A new parliament must be called "once in every third year," elaborate arrangements being made to prevent any failure in this respect, and for five months it could not be dissolved save with its own consent. The parliament, composed of a single chamber, was to consist of 460 members—400 for England and Wales, and 30 each for Scotland and Ireland—and the representative system was entirely remodelled, growing towns sending members for the first time, and many small boroughs being disfranchised. A large majority of the English members, 265 out of 400, were to be elected by the counties, where voters must possess land or personal property of the value of £200, while in the boroughs the franchise remained unaltered. In Scotland and Ireland the arrangement of the representation was left to the protector and the council. Roman Catholics and all concerned in the Irish rebellion were permanently disfranchised and declared incapable of sitting in parliament, and those who had taken part in the war against the parliament were condemned to a similar disability during the first four parliaments. The protector was empowered to raise a revenue of £200,000 in addition to a sum sufficient to maintain the navy and an army of 30,000 men, and religious liberty was granted "provided this liberty be not extended to Popery or Prelacy." The chief officers of state were to be chosen with the consent of parliament, and a parliament must be summoned at once in case of war. The practical effect of the Instrument was to entrust the government of the three countries to the parliament for five months out of every three years, and to the protector and the council for the remainder of the time. Although the Instrument bristled with possibilities of difference between parliament and protector, "it is impossible," as Gardiner says, "not to be struck with the ability of its framers."

Having issued many ordinances and governed in accordance with the terms of the Instrument, Cromwell duly met parliament on the 3rd of September, and on the following day he urged the members to give it the force of a parliamentary enactment. Many representatives objected to the provision placing the supreme power in the hands of a single person and of parliament, a discussion which was futile, as clause XII. of the Instrument declared that "the persons elected shall not have power to alter the government as it is hereby settled in one single person and a parliament." The proceedings were soon stopped by Cromwell, who on the 12th of September explained that there was a difference between "fundamentals" which they might not, and "circumstantials" which they might, alter. He concluded by stating that they would be excluded unless they subscribed a recognition to be true to the protector and the commonwealth, and to respect the terms of clause XII. Over three hundred members took the required step; but they proceeded to alter the Instrument in other ways, and over the question of the control of the army they were soon in sharp conflict with the protector. At length, on the 22nd of January 1655, Cromwell, counting twenty weeks as five months, dissolved parliament.

Regarding the Instrument as still in force the protector sought for a time to rule in accordance with its provisions; but new difficulties and growing discontent forced him to govern in a more arbitrary fashion. However, in July 1656 he issued writs for a second parliament which met in the following September. Many members, men of advanced views, were excluded by the council of state, acting on the strength of clause XVII., which declared that those elected must be "persons of known integrity, fearing God, and of good conversation." The remainder discussed the question of the future government of the country, and in May 1657 Cromwell assented to the Humble Petition and Advice, which supplanted the Instrument of Government. Gardiner says the Instrument was "the first of hundreds of written constitutions which have since spread over the world, of which the American is the most conspicuous example, in which a barrier is set up against the entire predominance of any one set of official persons, by attributing strictly limited functions to each."

The text of the Instrument is printed in S. R. Gardiner's *Constitutional Documents of the Puritan Revolution* (Oxford, 1899). See also S. R. Gardiner, *History of the Commonwealth and Protectorate*, vols. ii. and iii. (London, 1897–1901); L. von Ranke, *Englische Geschichte* (1859–1868); and T. Carlyle, *Cromwell's Letters and Speeches* (London, 1897–1901). (A. W. H.*)

INSUBRES (Ἴσομβρες, Ἰνσουβροι), a Celtic people of upper Italy, the most powerful in Gallia Transpadana, inhabiting the country between the Adda, the Ticinus and the Alps. According to Livy (v. 34) they appear to have been a branch of the Aedui in Gallia Transalpina, though others assume that they were Umbrians, a view to some extent supported by the form Is-ombr-es. Livy states that Bellovesus and his Gauls, having crossed the Alps and defeated the Etruscans near the Ticinus, found themselves in the territory of the Insubres (also the name of a *pagus* of the Aedui). Here they built a city and called it Mediolanum (Milan), after the name of a village in their home in Gallia Transalpina. The name Insubres thus appears applied to the inhabitants (1) of the Aeduan *pagus*, (2) of the territory in Gallia Transpadana occupied by Bellovesus, (3) to the founders of Mediolanum. From 222 to 195 B.C. the Insubres were frequently at war with the Romans. In 222 they were defeated at Clastidium by M. Claudius Marcellus, who gained the *spolia opima* by slaying with his own hand their king Viridomarus (Virdumarus), and in 194 they were finally subdued by L. Valerius Flaccus.

See H. Nissen, *Italische Landeskunde* (1902) ii. 179; A. Holder, *Altkeltischer Sprachschatz*, ii. (1904).

INSURANCE, a term meaning generally "making oneself safe against" something, but specially used in connexion with making financial provision against certain risks in the business of life. The terms Assurance and Insurance are in ordinary usage synonymous, but in the profession "assurance" is confined to the "life" business, and "insurance" to fire, marine and other miscellaneous risks. Assurance was the earlier term, and was used of all forms of insurance indiscriminately till the end of the 16th century. Insurance—in its earlier form, "ensurance"—was first applied to fire risks (see note *s.v.* "Insurance" in the *New English Dictionary*).

I. General History

During the latter half of the 19th century the practice of insurance extended with unprecedented rapidity, partly in novel forms. While its several branches, such as life insurance, casualty insurance and others, have each had an independent and characteristic development, all these together form an institution peculiar to the modern world, the origin and growth of which attest a remarkable change in men's ideas and habits of thought.

The simplest and most general conception of insurance is a provision made by a group of persons, each singly in danger of some loss, the incidence of which cannot be foreseen, that when such loss shall occur to any of them it shall be distributed over the whole group. Its essential elements, therefore, are foresight and co-operation; the former the special distinction of civilized man, the latter the means of social progress. But foresight is possible only in the degree in which the consequences of conduct are assured, *i.e.* it depends on an ascertained regularity in the forces of nature and the order of society. To the savage, life is a lottery. In hunting, rapine and war, all his interests are put at hazard. The hopes and fears of the gambler dominate his impulses. As nature is studied and subdued, and as society is developed, the element of chance is slowly eliminated from life. In a progressive society, education, science, invention, the arts of production, with regular government and civil order, steadily work together to narrow the realm of chance and extend that of foresight. But there remain certain events which may disturb all anticipations, and in spite of any man's best wisdom and effort may deprive him of the fruits of his labour. These are mainly of two classes: (1) damage to property by the great forces of nature, such as lightning and hail, by the perils of the sea and by fire; (2) premature death. A useful life has an economical value. But no skill can make certain its continuance to its normal close. In the reasonable expectation that it will last until a competence is gained or the family ceases to be dependent, young men marry; but some will die too soon, and in the aggregate multitudes are left destitute. Both classes of loss are alike, in that they fall on individuals in the mass who are not known beforehand nor selected by any traceable law. But the sufferers are ruined, while the same pecuniary loss, if distributed over the whole number, would be little felt. Wherever the sense of community has existed this has been discerned, and some effort made to act upon it. Thus in feudal Europe it was customary for the houses of vassals to be restored after fire at the cost of the estate. In England in the 17th century the government practised a method of relief after accidental fires. When such a loss was proved to the king in council, the chancellor sent a king's brief to churches, sheriffs and justices, asking contributions, and trustees for the sufferers administered the funds collected. But under the last two Stuarts gross frauds resulted, and the system fell into disrepute and disuse. At best, the voluntary relief provided by charity after losses are incurred is but sporadic and irregular. Insurance begins when the liability to loss is recognized as common, and provision is made beforehand to meet it from a common fund. The efficient organization of communities or groups for this purpose is an essentially modern achievement of social science. But the history of the conception in its formative stages is extremely obscure.

Its first appearance in business life is often sought in the marine loans of the ancient Greeks, fully described by Demosthenes. Money was advanced on a ship or cargo, to be repaid with large interest if the voyage prosper, but not repaid at all if the ship be lost, the rate of interest being made high enough to pay not only for the use of the capital, but for the risk of losing it. Loans of this character have ever since been common in maritime lands, under the name of bottomry and respondentia bonds. (See below, *Marine Insurance*.) But the direct insurance of sea-risks for a premium paid independently of loans began, as far as is known, in Belgium about A.D. 1300. During the next century the risks of insurance for the usual voyages between London and European ports were carefully considered, and customary rates became established. In his address in opening Elizabeth's first parliament in 1559, Sir Nicholas Bacon said, "Doth not the wise merchant in every adventure of danger give part to have the rest assured?" In 1601 parliament created a commission to decide disputes under contracts for marine insurance, and the preamble of the act (43 Eliz. ch. 12) expresses the best thought of the British mind in that day upon the subject. Thus the business of marine insurance was intelligently and wisely practised three centuries ago. But the underwriters were private persons, acting independently, so that the insured lacked the benefit of large aggregations of capital to make his contract safe; while the insurer, who took one or a few risks, was without the security of large averages and might be crushed by an exceptional loss. A partial remedy was gradually reached in London. Men who had capital to employ in this hazardous business used to meet at fixed hours when shipowners and merchants could negotiate with them. The higgling of the open market, in view of all the circumstances of each risk—as the character and condition of the ship, its crew and cargo, the length and route of the voyage, the season, the current rate of interest and profits—determined the rate of premium; and when this obtained general assent, the written agreement was signed by each underwriter for that part of the risk which he assumed. Towards the end of the 17th century these meetings were held in Lloyd's coffee-house, and their simple practice gradually grew into the complete and complicated system of marine insurance now general. The underwriters together evolved rules and improved methods, but continued for generations to insure severally, without corporate powers or common responsibility, so that the name Lloyd's became throughout the commercial world the symbol of marine insurance. More recently the name has been adopted in the United States by associations of private or individual underwriters as distinguished from insurance corporations.

Although the underwriters at Lloyd's often considered and assumed other than marine risks, and made contracts some of which were merely wagers on public or private events, there is no record of insurances by them against fire on land. But fire insurance, it is vaguely known, had previously been practised, in a crude form, in several European cities. In 1635, and again in 1638, citizens of London petitioned Charles I. for a patent of monopoly to insure houses at the rate of one shilling yearly for each £20 of rent, the association to repair or rebuild those burned, to maintain a perpetual fire-watch in the streets, and to pay £200 yearly towards rebuilding St Paul's cathedral until finished. The attorney-general approved the project, but in the disorders of the kingdom it was forgotten. The Great Fire of 1666 revived interest in the subject, and led to practical measures. In May 1680 a private fire office was opened "at the back side of the Royal Exchange" to insure houses in London, by assuming the risk of loss to a fixed amount for a fixed premium, namely, 2½% of the yearly rent for brick houses and 5% for frame houses, the rent being always assumed to be one-tenth of the value of the fee. The estimates of the promoters are interesting. In the fourteen years since the Great Fire 750 houses had been burned in London, with an average loss of £200. A fund of £40,000 subscribed as guaranty was to be increased by £20,000 for every 10,000 houses insured, and the interest of the fund alone therefore might be expected to meet all losses and leave a surplus. Thus the security was perfect and the promise of profit great. Meagre as was the basis of facts for the calculations, and crude as was the statistical method employed, the insurance offered met a general want and the business grew rapidly. Within a year a strong demand was heard that the city of London should itself insure the houses of its citizens, and the common council voted to do so at lower rates than the fire office. But the courts put a speedy end to this movement, holding that the charter conferred on the city no power to transact such business. Thus the socialistic theory that insurance is properly a branch of government is almost as old as the business itself, though it has never found favour or been practically tested on a large scale in Great Britain or America.

The next notable step in the evolution of modern methods was the organization of mutual insurance associations. In 1684 the Friendly Society was organized. Each member paid a small entrance fee for expenses, made a cash deposit as a reserve for emergencies, to be returned at the end of his term, and agreed to meet equitable assessments for current losses. Payments were computed on the assumption that one house in 200 is burned every fifteen years. The rivalry between the proprietary and the mutual systems began at once, and has continued till now. In 1686 "the Fire Office at the back side of the Royal Exchange" petitioned for a patent of the fire insurance policy and a monopoly of its issue for thirty-one years. The Friendly Society opposed the grant. The most eminent lawyers for both were heard by the king in council, and on the 30th of January 1687 King James II. decided the case. No charter was granted, but the Fire Office might continue its business, having a monopoly for one year. Thereafter the Friendly Society might for three months sell policies, but must then suspend for three months, and so on for alternate quarters. But the Fire Office must pay the ordinance service for its work in extinguishing fires, the amount to be fixed for each fire by the king. This was the first appearance of the plan, so widely prevalent in after years, of imposing on insurance companies the support of fire departments; that is, of taxing the prudent who insure to protect the reckless who do not.

After 1688 the atmosphere of England was freer, and underwriting was soon practised without special licence. In 1704 the societies began to insure household goods and stocks in trade, and the insurance of personal property rapidly became as important as that of buildings. In 1706 the Sun Fire Office was founded, and began to issue policies on both real and personal property in all parts of England. Other associations arose in quick succession of which the Union Fire Office, dating from 1714, and the Westminster from 1717, still survive. Before 1720 both fire and marine insurance had become general in all great centres of trade. But life insurance was as yet hardly conceived. Sporadic evidences that it was needed, and that men were feeling after it, occur in very early records. It was a medieval custom to advance to a mariner goods or money, to be restored with large additions, but only in case of safe return; or to contract, for a sum in hand, to ransom him if captured by pirates, or to pay a fixed amount to his family if he were lost. To evade the usury laws life annuities were often sold at a low rate, redeemable for a stipulated sum. Life estates were sold upon some guess at their probable duration; and leases, especially of church lands, were made for one, two or three lives on rude and conventional estimates of the time they would run. Thus there was a commercial and social pressure for some intelligent method of valuing life contingencies. But the direct insurance of life, as a means of reducing the element of chance in human affairs, was hardly thought of. Indeed, such contracts were commonly regarded as mere forms of gambling, and were prohibited in France as against good morals.

The earliest known policy of life insurance was made in the Royal Exchange, London, on the 18th of June 1583, for £383, 6s. 8d. for twelve months, on the life of William Gibbons. Sixteen underwriters signed it, each severally for his own share, and the premium was 8%. The age of the insured is not referred to, nor was it then considered, except when far advanced, in fixing the premium. Gibbons died on the 29th of May 1584. The underwriters refused to pay, alleging that twelve months, in law, are twelve times twenty-eight days, and that Gibbons had survived the term. The court, of course, enforced payment. A few instances of similar contracts are found, mostly in judicial records, during the 17th century; but every such transaction was justly regarded as a mere wager, at least on the part of the insurer. It could not be otherwise until the principles of probability and the uniformity of large averages were understood and trusted. A few great thinkers were groping for principles which were profoundly to modify the practical reasoning of after-generations. But their work first obtained wide recognition upon the publication of the *Ars Conjectandi*, the posthumous treatise of Jacques Bernoulli, in 1713. Meanwhile the social need for insurance continued to express itself in empirical efforts, which at least helped to make clearer the problems to be solved. Thus in 1699 "The Society of Assurance for Widows and Orphans" was founded in London, a crude form of what is now called an assessment company. Each of 2000 healthy men under fifty-five years of age was to pay 5s. as entrance fee, 1s. quarterly for expenses, and 5s. at the death of another member; and at his own death his estate should receive £500, less 3%. On default in any payment his interest was forfeited. The society lasted about eleven years, and the accounts of its eighth year are preserved, showing the payment of £5200 upon twenty-four claims. The economic significance of this society lies in its distinct recognition of the principle of association for the distribution of losses. Together with the Friendly Society, it shows that this principle had now been so widely grasped by business men that, when embodied in a practical venture, it found substantial support.

The conception of a corporation as an artificial person to hold property and support obligations uninterrupted by the death of individuals was found in Roman law and custom. Its first use in modern business enterprise was perhaps the Bank of St George in Genoa, about A.D 1200, a joint-stock company with transferable shares, whose owners were liable only to the amount of their shares. In England the crown, itself the chief and type of corporations sole, was the source of chartered rights, and from about 1600 the principle steadily gained recognition, the advantages of incorporation being attested by the successes of the great trading companies. Experience showed that the corporate form was the obvious remedy for the chief difficulties in the practice of insurance. Single risks were but speculative wagers; a great number must be taken together to obtain a trustworthy average. A larger capital than an average private fortune was demanded as a guaranty, and this capital must not be exposed to the dangers of trade, but set aside for the special purpose. Individual underwriters may die or fail; only a permanent institution can be trusted in long contracts. Several projects were devised on this basis. Early in the 18th century, indeed, the English government refused a charter for marine insurance, declaring that corporate insurance was an untried and needless experiment, while private underwriting was satisfactory and sufficient. But in 1720, when two sets of promoters offered £300,000 each for a charter, exclusive of other associations though not of individuals, to insure marine risks, parliament chartered the Royal Exchange and the London Assurance Company with a monopoly to this extent. The business disappointed its projectors at first, and the government accepted half the price rather than revoke the grant. In 1721 the companies extended their operations to fire insurance throughout England.

Thus the principle of insurance had now become a distinct part of the common stock of thought in enlightened nations, and gradually, by association with successive new ideas, plans and methods, was developed into a business or trade, which before the middle of the 18th century already formed an essential element of the social scheme. Most of the modern forms of insurance against the elements were known, and at least crudely practised. But there was no scientific basis for the business. Premiums were fixed, not by computation from known facts or reasonable assumptions, but by guess and the higgling of the market. Only the competition of capital checked the extortionate demands of underwriters. The first important steps towards a scientific valuation of hazards were taken in dealing with the class of risks hitherto so much neglected, those which depend upon human mortality. Marine and fire insurance had their origin in the pressure of need. The practice began before a theory existed. But life insurance had its origin in the scientific study of the facts of human mortality. Both marine and fire insurance became general before there was any intelligent study of the risks by statistical or mathematical methods, nor can it be said that much progress has since been made towards establishing a scientific basis for the valuation of risks in these classes. But life insurance may be said to have been impossible until the theory of probabilities had become a recognized part of the common stock of ideas.

The value of insurance as an institution cannot be measured by figures. No direct balance-sheet of profit and loss can exhibit its utility. The insurance contract produces no wealth. It represents only expenditure. If a thousand men insure themselves against any contingency, then, whether or not the dreaded event occurs to any, they will in the aggregate be poorer, as the direct result, by the exact cost of the machinery for effecting it. The distribution of property is changed, its sum is not increased. But the results in the social economy, the substitution of reasonable foresight and confidence for apprehension and the sense of hazard, the large elimination of chance from business and conduct, have a supreme value. The direct contribution of insurance to civilization is made, not in visible wealth, but in the intangible and immeasurable forces of character on which civilization itself is founded. It is pre-eminently a modern institution. Some two centuries ago it had begun to influence centres of trade, but the mass of civilized men had no conception of its meaning. Its general application and popular acceptance began within the first half of the 19th century, and its commercial and social importance have multiplied a hundredfold within living memory. It has done more than all gifts of impulsive charity to foster a sense of human brotherhood and of common interests. It has done more than all repressive legislation to destroy the gambling spirit. It is impossible to conceive of our civilization in its full vigour and progressive power without this principle which unites the fundamental law of practical economy, that he best serves humanity who best serves himself, with the golden rule of religion, " Bear ye one another's burdens."

II. Casualty and Miscellaneous Insurance

Before proceeding with an account of the standard institutions of fire and life insurance, it is proper to glance at the modern vast extension of casualty insurance, and to notice certain novel applications of the insurance principle to other special classes of events. The novelty of these enterprises, however, is not in the general idea underlying each of them. In almost every instance in which insurance has been extended, so as successfully to cover new kinds of risks, it will be found that the suggestion is nearly as old as the practice of life insurance. Many more kinds of insurance than are even now found useful were attempted more than a century ago. But no statistical basis then existed for determining the probability of loss from various casualties, nor had the methods of canvassing, accounting, proving and checking losses, reached the perfection now recognized as necessary for efficiency and safety. The various branches of business which, in distinction from the great standard institutions of life, fire and marine insurance, are commonly treated as miscellaneous insurance, differ widely in their subjects and methods. The most general of them, and that most widely known, is insurance against personal injury by accidents of every kind. Much has already been done by the companies in collecting and analysing facts, so as to determine the average risk of injury and disablement among different classes of men. But there is as yet no such union of effort among them to combine their resources for such purposes as among the life companies, nor does the subject admit of treatment so exact as that of human mortality. Hence it is impossible to speak of a theory of accident insurance in a scientific sense; and in its practice premiums and necessary reserves are determined by the trained business judgment of individual managers rather than by the calculations of actuaries from statistical collections of facts.

The insurance of railway travellers against injury upon trains was the first form of accident insurance which proved widely acceptable. This is still practised as a special business by several companies, tickets, entitling the purchaser or his family to a fixed compensation in case of his injury or death, being offered for sale with the railway tickets. But the development of insurance against personal injuries, which is most characteristic of the times, is the wholesale insurance of the employer against liability to the employed for accidental injuries sustained in his service. This was first undertaken on a large scale by the " Employers' Liability Assurance Corporation of London," founded for the purpose in 1880, immediately after the passage of the Employers' Liability Act by parliament, which made employers of labour liable for injuries sustained in their service to an extent unknown to the common law. The Workmen's Compensation Act 1906 greatly extended the classes of employers liable for accidents to their servants, and the number of companies devoting themselves to accidents and workmen's compensation has greatly increased, while practically every fire insurance office has taken up the business. The policies are issued to employers of labour, agreeing to indemnify them for any loss to which they may be subjected, at common law or by statute, in consequence of bodily injuries suffered by any employee while engaged in their service. In some cases the insurance company undertakes the investigation and settlement of each claim within the limits prescribed by the policy, and conducts any litigation which may result. The adjustment of damages can be made with more economy and skill by the companies than is usually possible for the employer, and the danger of fraudulent claims is largely reduced by methods experience has taught them. The price charged for such insurance is either a small percentage of the aggregate wages paid during the term, or a standard rate for each particular class of employment, or (in the case of large employers of labour) an " all-round " rate designed to cover every class of employee.

The most common form of accident insurance, however, is still represented by the policy which promises the assured a fixed sum in case of death by accident, and a weekly compensation during disability from such a cause. Many policies also specify a sum to be paid for the loss or permanent damage of a member, as an eye, a hand or foot. Another extension of the personal accident policy is the addition of some form of health insurance, especially the grant of a weekly sum to the insured during incapacity for work caused by certain named diseases. Besides the ordinary joint stock companies which carry on this class of business with fixed premiums, many associations organize for insurance against personal injury by accident, relying upon the assessment of members to pay claims as they mature. Many of these are local and ephemeral; but a number of them, formed by men engaged in common pursuits, for mutual protection, have attained importance. Such are especially some of the commercial travellers' and the railway employees' accident associations, and a few connected with the Masonic or similar beneficiary orders.

Another large class of casualty insurances applies to various forms of damage to property. The branch which seems most to have attracted promoters is the insurance of plate glass against fracture, which is carried on by a number of companies in Great Britain, and is the only business of several of them. In the United States there are five corporations which insure plate glass alone, while many other casualty companies issue also policies on glass. This business is not conducted in any other country upon so large a scale as in the United States, but is attracting more attention than heretofore in Europe, and especially in Great Britain.

There are several companies in the United Kingdom and in America which make the insurance against damage by the explosion of steam boilers a special feature of their work, but by far the greater part of the business is transacted by one company in each country. The service rendered is one of special skill and vigilance, extending far beyond the contract for indemnity. The company, in fact, employs inspectors of the highest scientific qualifications, who assume constant supervision of the machinery, and require its structure and conduct to be freed from elements of danger. It is prevention rather than compensation that is sought, and the outlay made by the companies is mainly for inspection and control, not for losses. It is usual to promise in a policy upon a steam boiler some compensation also for any personal injury which may result from an explosion.

There are some companies in England having insurance against burglary for their principal purpose, while several of the British and American accident companies issue policies of this kind. It is somewhat of an experiment, and the risks taken are for moderate sums, at premiums determined in each case by an estimate of the danger founded on a study of all the circumstances. There is no information published concerning this branch of insurance in other countries, but the aggregate premiums paid are not at present very large. It is believed by many that there is an important future for burglary insurance, in connexion with improved methods of protection, by safes, automatic alarms and constant inspection, for dwelling-houses, shops and offices, which are often unoccupied.

Insurance against damage to growing crops by hail is practised in several parts of Europe and America, commonly by small local associations on the mutual plan or as an incident to the business of fire insurance. No statistics can be obtained of these operations. The same is true of the insurance against the ravages of tornadoes, and against sickness and accident in domestic animals.

A wholly distinct business, commonly classed as a branch of insurance, has now grown to great importance, that of guaranteeing the fulfilment of contracts and of indemnifying employers against defalcations in their service. The bond of a corporation of large capital is widely taking the place which personal surety has filled in connexion with undertakings on contract, and with offices and occupations of trust, both in public and in private life. Fidelity insurance is carried on by a few of the general casualty companies, but as the practice of it extends it becomes more and more the work of special institutions organized for this purpose alone. In the United States there are many corporations of excellent standing, with aggregate paid-up capital of more than $15,000,000 and surplus funds of nearly $10,000,000 more, and collecting in premiums about $4,000,000 annually upon bonds and guaranties amounting to more than $1,250,000,000. The business practically only started at the close of the 19th century. It has had similar if not equal development in Great Britain and in several other countries, but it is only in the United States that the statistics of it are officially collected.

The insurance of titles to real property is also becoming widely extended. This business, however, has indemnity for losses as but an incidental purpose. The principal aim is to furnish a final and responsible assurance that the title is flawless. Several of the companies in the United States possess elaborate and expensive collections of records, covering the sources of title for cities or large districts; all of them employ expert ability of a high order; and when they approve a title as perfect, the purchaser or lender of money may receive, with the approval, a guaranty against loss in accepting it, which private examiners or counsel cannot give. Titles are insured also in other countries, but the business has nowhere else attained such importance, nor do the institutions transacting it make full and separate statements of their accounts. Other minor forms of insurance are against bad debts, bonds and securities in transit, earthquakes, failure of issue, loss on investment, leasehold redemption, non-renewal of licences, loss of or damage to luggage in transit, damage to pictures, loss of profits through fire, imperfect sanitation, birth of twins, &c.

III. Fire Insurance

The growth of the business of fire insurance since 1880 or thereabouts has been commensurate with the increase of wealth and of commercial activity in the foremost nations, while the practice of it has also become general in countries in which it was formerly little known. The statistics of the subject have in recent years become far more full and more accessible than formerly; partly because many governments require detailed reports of resources, receipts and expenditures from all companies permitted to establish agencies within their jurisdiction, and periodically publish summaries of the returns; but also largely because the companies seek the widest publicity as their best means of advertising. It is to be regretted that there is as yet no uniformity of method in these returns; while some of the most important elements of the subject are not sufficiently illustrated for the student in the published statistics. Many companies of the United Kingdom transact business throughout a great part of the world, and there is no means of determining how much of their receipts or their losses must be referred to Great Britain. Further, they fail to give classified amounts at risk, so that it is impossible to estimate with any confidence the total sum for which any kind of property, such as dwellings, factories, household goods, stocks of merchandise or wares in transit, is insured. The returns of the London Fire Brigade, however, which is in part maintained by regular contributions from the fire underwriters at the rate of £35 for each £1,000,000 of risks assumed by them within the metropolitan district, continue to exhibit a regular growth. The aggregate amount insured in the metropolis was reported as follows:—

In 1882	£696,715,141
1886	741,109,316
1890	806,131,385
1895	858,899,409
1900	963,291,097
1905	1,034,819,587

It appears probable that the rate of increase here shown is not greater than the actual growth of insurable property during the same period, so that it may be reasonably supposed that the custom of protecting all exposed property by insurance was already general in London many years ago. But the transactions of the British fire offices have grown much more rapidly, and indicate that, outside of the metropolitan district, the practice of insurance has extended greatly. The returns show that there is a tendency to concentrate the business in the control of large capital and experience, for practically all the premiums received and losses paid were shared by thirty-one companies, although there are at the same time a greater number of corporations of foreign countries with agencies for fire insurance in the United Kingdom; but many of these do but a nominal amount of business, and twenty-three of them are exclusively or chiefly engaged in re-insurance. This tendency has been a marked feature in the later history of fire insurance everywhere. The companies which are now in the field are the survivors of tenfold as many projected enterprises which have failed. The records of about two thousand organizations for the purpose, in America alone, which have undertaken the work and disappeared within fifty years, show the dangers to which inadequate skill and capital are exposed. But a small proportion of these failures were the direct result of sweeping disasters, though about seventy of them followed the memorable fires in Chicago and Boston in 1871 and 1872. Many more, nearly one-half of the whole, have followed a short career, in which the helplessness of inexperience to compete with long training and complete organization was demonstrated. Many hundreds of these projects were mere speculations or even frauds from the beginning; and the better education of the community at large in the principles and methods of insurance has been the chief agent in checking such enterprises, aided by the stringent legislation of several countries and of the United States in America and by the criticism of the press.

The difficulty of establishing a new joint-stock fire insurance company is far greater in the present highly perfected state of the business than formerly, and constantly increases. The reports of the state insurance departments in America show that less than one-eighth of the premiums are now collected by companies founded since 1880; and, except in districts remote from the principal financial centres, or mutual associations for special classes of hazards, new companies are not often formed. In Great Britain a considerable number of new corporations are registered every year, with fire insurance among their professed objects, but almost always in connexion with some forms of casualty insurance, which appear to be practically the purpose in view. The reports of the fire business in the United Kingdom for recent years, as collected in *Bourne's Manual*, show that less than one-fourteenth of it is done by companies organized since 1870. Though new companies have been registered, usually several every year, the number actually transacting successful business has not increased since 1880. Of the various British companies now recognized, the twelve smallest together collect but 1% of the premiums received by one of the largest, and the tendency to concentrate the business seems progressive. These facts are explained by the necessity of a vast basis of average and of a large capital for security, and still more by the increasing demand for a thoroughly trained and organized body of agents, able to protect their companies from fraud and imposition, and at the same time to compete for public patronage.

Mutual system.

The *Mutual* principle has a strong attraction for many insurers and projectors. When a large number of pieces of property, so distributed that a single fire cannot destroy a considerable proportion of the whole, are yet owned and controlled by persons who can fully trust one another, both for financial responsibility and for good faith, there may be no need of a large capital in hand, nor of much of the costly machinery required for general competition. A contract for the assessment on all the property of losses as they occur, at rates fixed by the estimated exposure, may form a safe basis for an association. The fixed payments may be limited to necessary expenses, with a moderate reserve for emergencies, all excess of collections to be returned to the insured. This simple conception of an insurance association, with such modifications as experience indicates, has been accepted for a time as ideal in almost every civilized community, and attempts are continually made to realize it, but in the vast majority of instances with complete failure as the result. Like every other product of human skill, insurance is, for the most part, best supplied to the market by those who make it their calling to produce it for gain. But while the mutual plan has proved poorly adapted to the general service of the commercial world, in some communities, and especially among the owners of certain classes of property, it has achieved great and apparently permanent success. This is particularly true of manufacturing districts, in which numbers of mills and factories are exposed to peculiar danger of fire by the nature of their own operations. The best safeguard they can have is by employing great skill in the construction, arrangement and conduct of their works. A group of such properties, associated for the prevention of loss, is naturally stimulated to highest efficiency when the whole group undertakes to bear all losses which are not prevented, and thus every member has a strong interest in making the protection complete. It is in associations of this character that the mutual plan of fire insurance has rendered its greatest services. The mutual plan has been widely adopted also in local associations for the insurance of dwellings and farm improvements, where the individual risks are small, and where technical classification and special safeguards against fraud are not considered necessary, often with the result of affording satisfactory protection at low rates. But the ratio of this part of the business to that conducted by joint-stock companies diminishes from year to year, even in the agricultural and rural districts of the United States. According to the reports of the insurance departments of the states, as summarized in the

Spectator Company's Year-Book, more than half of the cash premiums of mutual insurance companies are collected in the two manufacturing states of Massachusetts and Rhode Island.

It is, after all, only within a very limited field that the mutual principle can be adopted. The essential principle of fire insurance is the distribution of loss. It does not aim, directly at least, at the prevention and only in a secondary way even at the minimizing of loss; but what it seeks to accomplish is that such losses shall not fall exclusively, and possibly with overwhelming effect, on the owner of the property destroyed, but shall be borne in easy proportions by a large number of persons who are all alike exposed to the risk of a similar catastrophe. To work out the equitable solution of such a problem an amount of technical skill and extended experience is required which few bodies or communities possess. Certainly, experience in Great Britain has shown that the one system of fire insurance which has contributed most to the public benefit is that which is conducted by joint-stock companies, offering to the insured the guarantee of their capital and other funds, and looking to make a profit by the business. In France, Belgium, Holland, Russia and Norway, also, the joint-stock plan is almost exclusively employed. Such an opinion must be qualified by observing that, under the fostering influence of the national and municipal governments, the mutual plan has reached an important development in Austria-Hungary, Germany, Switzerland and Sweden. In all these countries, indeed, corporate enterprise on a large scale, in every branch of business, is of comparatively late growth, and mutual fire insurance was a familiar practice long before joint-stock companies entered upon this field of activity. The tendency in the large cities and commercial centres is to throw new insurances into the business corporations, while the time-honoured mutual associations retain their standard character and customary clientage. But in these countries the mutual plan has an established place in the confidence of the rural population, who are generally strongly prejudiced against moneyed corporations. This is especially true of the cantons in Switzerland and certain districts in Austria-Hungary, where fire insurance is administered by the local governments in connexion with a minute police supervision of the construction of buildings and of other conditions affecting the risk. From the published returns of the companies and the authorities, as collected for the *Post Magazine Almanack* (1900), it would appear that of all the fire insurance premiums paid in Switzerland nearly 54% is collected by the mutual associations and the cantonal authorities; while in Italy 37%, in Germany 27%, in Sweden 27% and in the Austro-Hungarian monarchy 20% go to mutual companies.

Lloyd's.

The earliest plan of insurance which was successful as a business was that practised at Lloyd's Coffee-house (see LLOYD'S) in London, and there applied almost exclusively to marine risks. Although the association known as Lloyd's has been for generations a strong financial institution, with every modern safeguard, and since 1871 has been a chartered corporation with large funds, yet its name has become accepted as the symbol of the primitive practice of combined underwriting by individuals, each upon his own credit, for a share of the risk and without common liability.

A few associations on this general principle were known to exist in America, and to issue fire policies on a small scale, before 1892, but chiefly for mutual insurance. In that year, in a general revision of the insurance law of New York, such associations already in existence were expressly exempted from all its provisions. Speculators at once discerned an opportunity. If a company by omitting to take corporate form could carry on the business free from all restrictions and burden of state supervision, it would compete at great advantage with the insurance corporations. While the new law was in prospect there was time to take action; and upon its passage there suddenly appeared a multitude of "organizations" claiming the exemption as Lloyd's, or associations of individual underwriters, and offering fire policies at rates materially lower than those of the joint-stock companies. Each of these was represented and managed by an attorney for the subscribers, supposed to have power to bind them severally to the amount of their subscriptions. The standard policy prescribed by law in New York was issued, with a clause making the liability several only, and fixing the amount. The Lloyd's entered the market with the zeal and prestige of a new idea and a great name, and they grew rapidly in number and in business, but made no reports. Extending their agencies into other states, they occasioned much litigation concerning their legal existence and rights and some rash and inharmonious legislation. But several attempts to establish similar Lloyd's in other places failed. Experience soon showed that it was impossible to enforce claims in the courts, when the liability was distributed among many, without excessive expense and delay, even when all the subscribers were solvent, while a few good names, however useful in canvassing, were no guarantee of the responsibility of unknown associates. In 1896 the executive and legal authorities of New York assumed a hostile attitude towards speculative schemes of this class, and indictments were found against a number of promoters for falsely antedating constituent agreements. The bubble burst suddenly, and within three years more than one hundred of the Lloyd's disappeared. A few reinsured their risks or were merged in permanent companies, but the mass of them proved to have no substance. Four or five only of the best Lloyd's continue to issue fire policies within a narrow and special circle, but as a group they no longer compete for general business.

The rate of premium varies with the supposed risk, but certain descriptions of property are specially and more elaborately rated. This has been done to a considerable extent by common agreement amongst the offices, and the arrangements are known as the "tariff system," which requires here a few words of explanation.

We may suppose the question to arise, What ought to be paid for insuring a cotton-mill, or a flax or woollen mill, or a weaving factory, or a wharf or warehouse in some large city? The experience of any one office scarcely affords adequate data, and a rate based on the combined experience of many offices has a greater chance of being at once safe and fair. The problem, indeed, is a more complicated one than what has been already said would indicate. The property to be insured may consist of several distinct buildings and the contents of them: one building may be devoted to operations involving in a high degree the risk of fire; in another the processes carried on may be more simple and safe; a third may be used only for the storage of materials having little tendency to burn. Fairly to measure these various hazards it has been found necessary that the experience and skill at the command of many companies shall be combined, and that the rates shall be the result of consultation and a common understanding.

Now it is clear that no office will contribute its skill and experience to such a common stock if the effect is to be that other offices may avail themselves of the information in order to undersell it. Consultation about rates and a common understanding necessarily involve a reciprocal obligation to charge not less than the rates thus agreed on; in other words, a tariff of rates is developed to which each office binds itself to adhere. The system tends to restrain and moderate the competition for business which inevitably and to some extent properly exists among the companies, and its value to them is manifest. But it is also of service to the insuring public. At first sight it might seem that free competition would suit the public best, and that a combination among the offices must tend to keep up rates, and to secure for the companies excessive profits, but a little consideration will show that this is a mistake.

It is an unquestionable truth, though one often lost sight of, that all losses by fire must ultimately be borne by the public. The insurance companies are the machinery for distributing these losses, nothing more. If the losses fell on them, their funds, large as they are, would speedily be exhausted, and the service which they render to the public would come to an end. To those who require insurance against loss by fire it must be a manifest advantage that they should have many sound and prosperous offices ready to accept their business, and no less able than desirious to earn or to retain the public favour by fair and liberal conduct. A necessary condition of this state of things is that the rates of premium paid for insurance should be remunerative to the offices, and the main object of the tariff system is to secure such remunerative rates.

This it endeavours to do by two methods—by an agreement as to what rates are to be charged, and by affixing such a penalty to dangerous constructions, substances and processes as to induce, if possible, a lessening of the danger. In other words, and reversing the order, it seeks to diminish the risk of fire, and to secure adequate payment for what risk remains. On the supposition that the offices are correct in their estimate or risks, the effect, and indeed the intention, of their rule is not so much to put money into their own coffers as to lessen the danger, and to save themselves in the first instance, and the owners of property ultimately, from the consequences of preventible fires.

These rules, as will readily be seen, must have powerful influences on trade and manufactures. Many individual warehouses and mills are, with their contents, insured for very large sums, £10,000, £20,000, £50,000, £100,000 and more. An additional charge of 5s. or 10s. % in respect of a supposed increase of risk may mean a payment by the owner of several hundred pounds a year, and may operate as a complete veto on some arrangement or some machine which it might otherwise be desirable to resort to. The occurrence of a few severe fires in one town, followed by an increase of insurance rates, may have, and indeed has had, the effect of driving some branch of trade to another locality, the seat of greater caution or better fortune. It is therefore obviously desirable that so important an influence should be exercised, not precariously or capriciously, but according to the combined wisdom and experience of those associations which may be supposed to understand the subject best, and which obtain their experience in the way that makes it perhaps of most value, by paying for it.

It is equally for the public benefit that rates of insurance should be fixed on some common scale. Suppose the system of unrestricted competition to be tried, the first effect will be a general and great reduction in rates. But it may be said, "So much the better for the insured; if the offices can afford this reduction of rate, it will only be a fair result of competition; if they cannot afford it, they will be the losers, but the public will gain; will the effect not be simply to reduce the rates to the paying point and no further?" This would be all very well if the paying point could be absolutely ascertained or determined in any way beforehand, but the rate comes first and the losses come afterwards. In other businesses prices are based on some certainty as to the cost of production, but in selling fire insurance the cost is not known till after it has been sold. In a free competition it is the sanguine man's views which regulate the market price, and the rates therefore cease to be remunerative. The consequences are that some offices disappear altogether, others take fright in time to avoid ruin, though not to escape serious loss, persons who might establish new offices are deterred from doing so, the business gets the character of being a highly speculative and hazardous one, requiring extravagant profits to induce men to carry it on at all, and the public have to bear the cost. Unrestricted competition therefore is not for their advantage.

The combination for uniform rates has another beneficial effect; it serves to distribute the burden of losses fairly. If it is a just thing that cotton-spinners should bear all the losses that arise in cotton-mills, and not leave them to be borne by the owners of private dwelling-houses, or vice versa, it is well that the loss by each class of risks should be measured fairly. But, while the experience of any one office, taken by itself, furnishes a very imperfect criterion, each contributes its quota of knowledge and experience to the common stock, and the public get the benefit both of broad and trustworthy data and of that peculiar and intimate acquaintance with each different class of property or process which the conductors of one company or another are sure to possess.

No conventional or excessive rates can, however, be maintained for any length of time. Some member of the union is sure to perceive that popularity and profit may be gained by introducing a lower rate, if a lower rate is manifestly sufficient, or a new company starts into existence to remedy the grievance. It is to be remembered, too, that the directors and shareholders who control the offices are likewise insurers, quick to raise the question of how far the rates they have to pay as individuals are justified by the risks run; and if it cannot be shown that these rates are a true measure of the risk, offices are soon constrained by a sense of justice or by self-interest or by pressure from without to mitigate them. In short, the association is a union bound together by necessity and tempered by competition.

Adequately to measure the risk of loss by fire demands not merely reference to an extended experience but a watchful regard to current changes. While the profits of fire insurance business fluctuate considerably from year to year, and seem even to follow cycles of elevation and depression, the tendency on the whole appears to be towards a growth of risk, although excessive competition among offices prevents the rates from rising in proportion.

Tariff difficulties.

The *Tariff* system has steadily developed in minuteness of classification and in adaptation to wider experience, as well as to the changes in the character of many classes of risks by improvements in building and by the introduction of new kinds of goods and machinery. The estimates of risk and the determination of premiums are largely governed by individual opinion and by competition, no amount of experience furnishing a statistical basis on which trustworthy predictions of average loss can be made. Hence it is only by constant co-operation among insuring institutions in the exchange and combination of their observations that justice can be done to them and to the public. The proper extent of this co-operation is easily attained where the business is free from all restrictions except those of the common law, as in Great Britain, and the competition of capital for profits is keen enough to keep the rates within reasonable limits. But in countries in which the government regulates the business in a more paternal spirit, and meddles with all its details for the avowed purpose of securing the safest and best public service, many difficulties arise. This is increasingly the case in several of the nations of Europe, notably in Austria, Switzerland and Germany.

But it is in the several states of the United States that the government supervision of insurance has most interfered with and modified the natural development of the business. In recent years, beginning with 1885, sixteen of these states have enacted legislation, dictated by the growing jealousy of corporate powers and privileges, forbidding fire insurance companies or their agents to combine in any form for the determination of rates. Companies have often been indicted, fined and deprived of authority to issue policies because of membership in associations for the purely scientific purpose of ascertaining their average experience. The courts have frequently narrowed in their interpretations the sweeping intent of such laws, but have generally sustained them as within the power of the legislature, and at the present time there is an overwhelming public sentiment in large sections of the country arrayed against every semblance of union or consultation among the companies upon the basis of their business. In several instances all the important insurance companies have withdrawn their agencies at once from particular states, and the business community has been sorely distressed for want of their protection. But the popular prejudice has not yielded to its demand, and the companies have never been able to maintain their own position with unanimity, the temptation to secure a vast business upon any terms being always too strong for some of them to resist. This form of legislation has beyond dispute increased the cost of insurance to the people, while it has embarrassed and disturbed the regular work of the companies.

Another pernicious tendency of popular legislation in the United States is found in the *Valued Policy laws*, the first of which was adopted by Wisconsin in 1874, providing that when any insured building is wholly destroyed by fire the amount of the policy shall be conclusively taken as the amount of the loss. This principle, with various modifications and extensions, has become law in some twenty states of the Union, though in many of them its enactment has been vigorously resisted by the executive government; several governors have vetoed such bills, while most of the supervising officers have had the intelligence to disapprove them. The provision is regarded by all insurance authorities as highly dangerous, inviting over-insurance and incendiarism; and there is no doubt that it has this tendency in many instances. But the statistics available, while showing that in general the rate of loss has increased where such laws are in force, do not demonstrate any such wide and ruinous stimulation of fraudulent practices as has been apprehended by thoughtful critics. The actual result is commonly to throw upon the insurer the responsibility for providing in advance against over-insurance by minute surveys and, in special cases, for continual watchfulness against depreciation. Like all other interference of government with private contract, however, it has a marked effect in increasing the difficulty and expense of business transactions.

Need of co-insurance.

The direction in which fire insurance as a social institution calls most pressingly for improvement is the extension of the principle of co-insurance. The importance of this can only be understood by remembering that the aggregate losses of the community by fire are chiefly made up of innumerable small fires and not of sweeping conflagrations. The experience of every company confirms the general truth, that the number of fires in which a building is totally destroyed, or in which the loss amounts to the greater part of the property exposed under the same risk, is comparatively very small. It may be asserted with confidence that, in the grand aggregate of the business, much more than three-fourths of the loss occurs in fires in which less than one-tenth of the insurable value at risk is destroyed. The practical result is obvious. If fires destroy a million of dollars' worth in property insured for its full value, and a million's worth more in property insured for one-tenth of its value, the insurers will pay $1,000,000 upon the first group and more than $750,000 upon the second. But if all the insurance is taken at the same rate the insurers will have received premiums ten times as great on the former group as upon the latter. This rough illustration shows that in an equitable adjustment of rates the amount insured as compared with the value exposed is a prime element, and that premiums might justly form a scale, highest on the smallest fractions of value, and diminishing rapidly as the percentage of insurance increases. Such a scale is, however, impracticable for many reasons, apart from the endless complications which, even if it could be constructed, it would introduce into the classification of risks. Any scientific plan of insurance, therefore, must provide another method for maintaining the proportion between amounts of premiums paid and the share in its benefits obtained for them. This is the purpose of what are generally called *average* or *co-insurance clauses*. The principle is, that when a proper rate for a class of risks is found, then the insured may protect at that rate any percentage of such a risk, and in case of fire shall be indemnified for the same percentage of his loss. When once clearly grasped, this principle largely simplifies and rectifies the business. It is in universal use in marine insurance under the name of "average," and is there recognized as indispensable. It is embodied in all fire policies in France, Germany and several other countries of Europe, and in 1826 was made compulsory in Great Britain by law in all "floating policies," those, that is, which cover stocks of goods distributed in several places and in fluctuating amounts. But it has not yet become general in Great Britain or America, although every writer of authority on the subject, and every practical underwriter of large experience, approves it. Systematic attempts have been made since about 1892 to extend its application in the United States with much success, but they have been met by strong opposition, which shows a widespread misunderstanding of its true bearing.

The co-insurance clause, indeed, which has been generally approved by the American associations of underwriters, and applied in the great commercial cities, is less sweeping than the parallel agreements used in France and Germany. The latter regard the insured owner as self-insurer for the entire value at risk not covered by the policy, and grant indemnity only for that fraction of the loss which the amount insured bears to the whole amount exposed. The American clause is less logical, commonly providing that: "If at the time of fire the whole amount of insurance on the property covered by this policy shall be less than 80% of the actual cash value thereof, this company shall . . . be liable only for such portion of such loss or damage as the amount insured by this policy shall bear to the said 80% of the actual cash value of such property." But this limitation of the basis of co-insurance average to 80% of the total value is in perfect harmony with the conservative policy which seeks in all cases to prevent over-insurance. The most serious danger to which the entire system is open is that a fire may promise profit to the insured. To avoid this, it is a small enough margin to exclude from protection by the policy one-fifth of the estimated value, and to require the owner to assume that proportion of the risk. It is therefore reasonable not to require in any case a larger share than four-fifths to be covered, and not to press the co-insurance principle so far as to offer a differential advantage to those who insure above this limit. Thus, for practical purposes, and in the general mass of business, the 80% clause may be accepted as approximately the best application of the principle. It makes possible substantial equity in distributing the cost, while it does not interfere with proper safeguards against over-insurance. The cordial support of the mercantile community in the great cities, and of the most intelligent state officers, has been given to it.

A popular outcry has, however, arisen against all forms of co-insurance, on the superficial and mistaken assumption that in every case the principal sum named in the policy measures the insurance paid for by the premium; and that any limitation upon it must be a wrong to the insured, for the emolument of the insurance corporation. No less than ten states have passed laws prohibiting the clause within their jurisdiction, though Maine in 1895, after a trial of two years, repealed the prohibition. The law of Tennessee, a typical form, is as follows: "Insurance companies shall pay their policy-holders the full amount of loss sustained upon property insured by them, provided said amount of loss does not exceed the amount of insurance expressed in the policy, and all stipulations in such policies to the contrary are and shall be null and void" (except in case of insurance upon cotton in bales). In several states the use of the co-insurance clause is made a penal offence. It is an interesting fact, however, that while this principle, whenever it has been generally applied, has led not only to a fairer equalization of premium rates, but, on the whole, to a marked reduction of them, the laws in question have deprived the people adopting them of the resulting benefit. In the year 1899 the average premium rate upon all fire risks written in the states in which co-insurance was wholly or partly prohibited was something more than $1·20 per $1000, while in the rest of the country, where the clause was permitted and to a large extent used, the rate was but 96 cents per $1000. The marked difference, which tends to increase, is a perpetual object-lesson which must in the end appeal strongly to the popular intelligence.

Taxation of insurance.

The varying attitude of several civilized governments towards the institution of insurance has found significant expression in their tax laws. In Great Britain a stamp duty of 6d. was imposed in 1694 upon "every piece of vellum or parchment or sheet of paper upon which any policy of insurance should be engrossed or written," and was doubled in 1698. It was further increased (reaching 3s. 10d. per policy in 1713) and varied by many subsequent acts, under some of which the percentage duty on fire insurance was also made payable by stamps upon policies. But in 1865 the stamp tax was finally reduced to the nominal sum of 1d. upon each policy. A far heavier burden, however, was imposed upon insurers by the measure of Lord North in 1782, charging all fire insurances in force with an annual duty of 1s. 6d. for every £100 insured. In 1815 the general rate was made 3s. per £100, but was collected once for all upon the policy when issued; and it so remained until reductions began in 1864. The duty was wholly abolished in 1869. The revenue from this source reached its highest point in 1863, when it was £1,714,622, presumably representing insurances effected in that year to the amount of £1,143,081,333. There are no data for determining the amount of premium receipts or of losses realized on the same volume of insurance; but the tax was recognized by economists as well as by all parties to the policy contracts as an excessive burden. In many instances it more than doubled the cost of insurance. Its effect in discouraging the prudent custom of insuring against fire was very serious, and after its abolition this custom extended so rapidly that it soon became, and continues, practically universal in Great Britain. Upon the continent of Europe fire insurance is generally taxed quite heavily; most so in France, where the direct duties on the premiums, together with the registry and stamp taxes paid by the companies, have been estimated to add one-fourth, or perhaps one-third, to the cost of insurance.

In the United States the companies are taxed, each by the state in which it is domiciled, upon their real estate, and often upon their capital, surplus or profits, and are required in other states to pay fees to the insurance departments, and commonly an excise of from 1 to 2½% of their premiums. An elaborate table is prepared each year by a committee of the National Board of Fire Underwriters, showing the aggregate amount of taxes paid by the companies operating in New York in comparison with their receipts and profits. The statement received and published by the board in 1900 contained the following:—

	For the Year 1899.	For Twelve Years 1888–1899.
Premiums (fire and marine).	$134,450,639	$1,425,929,631
Losses paid (fire and marine)	91,031,677	856,978,494
Expenses	52,849,129	517,667,238
Increase of liability (unearned premiums, &c.) .	8,998,526	59,104,388
Net loss in the last year . .	18,428,693	. .
Net profit in twelve years .	. .	7,820,489
Amount of taxes paid . .	4,495,332	35,984,081
Taxes were of premiums .	3·34%	2·52%
Taxes were of premiums, less losses	10·35%	6·32%

In qualification of this statement, it may be said that the reported expenses appear to include taxes, and that the additions charged to liability are to some extent theoretical and flexible. It also appears from the state reports that upon the entire capital and net surplus of $191,000,000 employed in the business in the United States by 316 joint-stock companies, dividends to the amount of $8,000,000, or 4·2%, were paid in 1899 to shareholders. Nevertheless it is true that competition among the companies, together with unfriendly legislation, has reduced the profit upon their aggregate capital near the vanishing point, and that the taxes, the average rate of which increased 50% within the period 1891–1899, are heavier in many states than can be justified by public policy or by the analogy of other corporate interests. The true principle, doubtless, is that while the capital employed in insurance for gain ought to contribute to the state the same share of its profits as other capital, yet the premiums, agencies, policies and entire machinery representing only losses, and providing for their distribution, should be exempted, as far as the necessities of the public treasury permit.

One aspect of the taxation of fire insurance is of especial interest, namely, the very general disposition of legislatures and municipal authorities to impose upon the underwriters the cost of fire departments. The systematic prevention and extinguishment of fires are everywhere assumed to be proper work for the community at large. But the first license granted by the crown to issue insurance policies in London in 1687 was conditioned upon regular contributions by the authorities to support the king's gunners as a fire brigade, and in the public mind the privilege of insuring the prudent has ever since been vaguely associated with the duty of guarding the property of the whole community. The voluntary support of fire patrols by the companies in London, New York and other cities has done much to promote this view; and a substantial part of the taxes paid upon fire policies in the United States is levied for the support of fire departments, the pay and pensions of firemen and similar purposes. The tendency to increase such taxes, under the pretext that the protection afforded is for the special benefit of the companies, is strong in some of the states; though it would be equally rational to compel life insurance companies to maintain general hospitals for the sick.

The most complete statistics of the fire insurance business collected in any country are those presented in the *United States* to the National Board of Fire Underwriters at each annual meeting. The following summary of part of the information submitted by the committee on statistics, 10th May 1900, giving the amount of fire risks insured in the United States, premiums received for them, and losses paid upon them, by all joint-stock fire insurance companies for the year 1899 will serve as an example:—

Statistics.

Fire Insurance in the United States. Joint-Stock Companies.

Companies.		Fire Risks assumed.	Fire Premiums received.	Fire Losses paid.	Premiums per $100 of Risk.	Loss per $100 of Risk.	Loss per $100 of Premiums.
		$	$	$	$	$	$
American	218	12,251,299,499	93,577,169	59,119,018	·7638	·4826	·6318
Foreign	35	6,087,570,275	42,958,472	29,865,014	·7057	·4906	·6975
All	253	18,338,869,774	136,535,641	88,984,032	·7445	·4852	·6517

These returns do not include mutual companies. The compilers of the *Insurance Year-Book*, however, obtain from the several state departments of insurance the reports of all companies made to them of the business done within each state; and from these it appears that in 1899, for example, 160 mutual companies assumed fire risks to the amount of $1,119,772,848. Many small local associations have made no returns, but their operations are too limited to materially affect the aggregate. It is noteworthy that while mutual companies transact less than 6% of the business of the whole country, yet in the state of Rhode Island, a densely peopled manufacturing community, they have more than 78%, and in Massachusetts nearly 24%; and that, while less than one-ninth of the insured property of the United States is situated in these two states, they contain nearly two-thirds of that which is insured by mutual associations.

The fire insurance business of foreign companies in the United States was comparatively small until 1870. Four strong British corporations were then in the field, and their transactions amounted to less than 9% of the entire joint-stock business. But their success attracted others in rapid succession, especially from Great Britain and from Germany, and in 1880, 19 foreign companies assumed 23·7% of all the risks reported to the National Board; in 1889, 23 such companies took 30·3%; and in 1899, 35 such companies took 33·2%. The distribution of the business among them is not given by the board tables, but can be gathered from the reports of the American branches to the insurance departments of the states, which are summarized in the Spectator Company's Year-Books. The total net payments of the British and colonial fire insurance companies in connexion with the disastrous fire in San Francisco in 1906 amounted to over ten million pounds, and the prompt settlement of all claims strengthened considerably their position in the United States.

In the *United Kingdom* the statistics of fire insurance are less accessible and less complete, no official records being made of the local distribution of the property insured, while the published accounts of the companies are not sufficiently uniform and detailed to make a trustworthy summary of the entire business possible. Much of it is done by foreign companies, of whose British business we have no separate statement. A statement of the revenue accounts of the various British companies insuring against fire will be found in the annual *Insurance Blue Book and Guide.*

In the *Dominion of Canada* the insurance companies make detailed reports to the government bureau, and the statistics of the business are full and accurate. The following table shows the aggregate business of five companies in the Dominion in 1869 and 1907:—

Companies.	Net Cash Premiums received.	Amount of Policies taken.	Amount at Risk in 1869.	Amount at Risk in 1907.	Losses paid.
	$	$	$	$	$
Canadian Companies.	54,849,706	5,663,696,931	59,340,916	412,019,532	36,073,543
British Companies	159,372,986	14,745,342,255	115,222,003	937,240,828	105,203,259
American Companies.	32,449,482	2,801,078,045	13,796,890	265,401,198	20,129,323
All Companies	246,672,174	23,210,117,231	188,359,809	1,614,661,558	161,406,125

Upon the *continent of Europe* the fire insurance business is conducted partly by local companies in each country and partly by the great international offices of Great Britain and Germany. The local associations in Austria, Germany and Switzerland are of three classes—public assurance organizations connected with local governments, private mutual companies and joint-stock companies. It is impossible to obtain balance-sheets of all, nor is any information available concerning the local distribution of the risks, or the whole amount of property insured. The capital employed by stock corporations in this business in each country, and the aggregate premium receipts and payments for losses in the last year of which a report is available will be found in the annual *Post Magazine Almanack.*

While most of the fire insurance business in the *Australian colonies* is in the hands of British companies, local institutions for the purpose have had a considerable development on the same general lines as in Great Britain and with similar freedom from interference by the governments. But no accounts of the receipts and losses are available, most of the companies conducting a marine or life insurance business, or both, under the same general management.

Beyond the limits of the great commercial nations, no satisfactory information is accessible concerning the practice of fire insurance. Even in Spain and Portugal there is far less intelligent interest in the subject than in neighbouring countries, and the agencies of foreign companies transact much of the business in the large towns. Six Portuguese companies have maintained themselves for many years, a few of them for nearly a century, and have established agencies in the Spanish islands and in Madeira. For other nations than those mentioned, the only systematic effort to collect the facts is made by the compilers of the *Year-Book*, and the results are extremely meagre. The great British and German corporations are zealous in extending their transactions to the commercial ports everywhere, and local companies are often formed in the British colonies. In addition to those in Canada and Australia some companies in South Africa have become financially important. Small native companies have been successful in establishing their credit in Japan, Brazil, the Argentine Republic, Chile and Peru. A considerable business is done in insuring the property of foreign residents in the Levant, on the coasts of Asia, in South Africa and the Pacific Islands, but mostly by European companies, and as an incident to the more general practice of marine insurance. There are several successful fire companies among the Dutch in Java. The small business in Mexico appears to be wholly in the hands of foreign companies.

IV. Life Insurance

Guesses at the probable length of life for the purpose of valuing or commuting life-estates, leases or annuities were made even by the ancients, and crude estimates of the number of years' purchase such interests are worth occur in Roman law and in many medieval writings. In 1540 the English parliament enacted that an estate for a single life should be valued as a lease of seven years, one for two lives as a lease of fourteen years, and for three lives as a lease of twenty-one years. More than a century later *The Cambridge Tables for renewing of Leases and purchasing Liens*, a standard work in England, with the certificate of Sir Isaac Newton to its accuracy, proposed, as a remedy for the inequity of this fanciful rule, to make the increase for each additional life less by one year, so that, valuing a single life at ten years, two lives shall be reckoned as nineteen years and three lives as twenty-seven years. No distinction of ages was recognized, and the results, tabulated to decimal parts of months, are worthless. Thus the foremost minds of the world had as yet no apprehension of a true method of reasoning on the subject. The first clear insight into the character of the problem appears in *Natural and Political Observations on the Bills of Mortality*, published in 1661 under the name of John Graunt, a haberdasher and train-band captain of London. Graunt recognized the principle of uniformity in large groups of vital and social facts, and actually prepared, from the mortality registers of London, what he calls a "Table showing of one hundred quick conceptions, how many die within six years, how many the next decade, and so for every decade till 76." This was the earliest crude suggestion of a table of mortality, and Graunt's interest in the inquiry was scientific, without definite practical purpose. But a little later the sale of annuities was pressed upon governments as a method of discounting future revenues. In 1671 John de Witt, grand pensionary of Holland, reported to the states general a plan for such sales upon a scientific method, the insight and skill of which, had he possessed proper statistical data, would have anticipated results only reached by later generations. The report, however, was buried in the Dutch archives and forgotten for nearly two centuries. It was unknown in England when, in 1692, the government undertook the sale of annuities. A loan of £1,000,000 was offered, each £100 paid in to purchase a life annuity of £14, without distinction of age. A table accompanied the offer, purporting to show how many of 10,000 persons now living, old and young taken together at random, are likely to die in each year from one to ninety-nine. The purchasers, though without clear understanding of the principle, were instinctively shrewd enough to select healthy young lives for annuitants, and the nation paid enormously for the error. This speculation of the public treasury led the eminent mathematician and astronomer, Dr Edmund Halley, to examine the subject. In 1693 he presented to the Royal Society a study of "The degrees of mortality of mankind." The parish registers of England took no note of age at death, and Halley, perceiving that the average duration of life in large groups of persons can only be determined when ages at death are known, sought in vain a statistical basis for such an inquiry in his own and in many other countries. But it happened that the city of Breslau in Silesia had kept such records, and he succeeded in obtaining the registers for five years, 1687–1691, including 6193 births and 5869 deaths. No census of the city having been taken, Halley made the best estimate he could of the population, and computed how many of a thousand children taken at the age of one year will die in each succeeding year. Arranging the results in three parallel columns, showing in successive lines the age, the number living at that age, and the number of deaths during the year, he formed the first mortality table. The arrangement was itself a discovery, exhibiting at a glance the essential data for valuing life-risks, and suggesting solutions for problems which had puzzled the ablest students. This general form of the mortality table remains in use as the natural and best for such collections of facts. The method of using such a table in calculating the values of life contingencies was also discovered by Dr Halley. He showed that where a payment is to be made at a future date, if a named person be then alive, its present value is the sum which compounded at interest during the interval will amount to that payment multiplied by the fraction representing the probability that the person will survive. These two elements, compound interest and the probability of life or death, are the foundations of the theory of life contingencies.

History.

Halley's Table.

From Halley's time the progress of the theory has been in three directions: first, in accumulating facts from which averages are deduced, and analysing the data so as to eliminate disturbing influences, that is, in constructing trustworthy tables of mortality; secondly, in extending the inferences from such tables, and multiplying their applications to needs of practical life; and thirdly, in facilitating the calculations which these applications require. But while Halley thus firmly and lastingly drew, in outline, the theory of life contingencies, the numerical results attained by him were grossly imperfect. Forced by the lack of data to assume that the population was stationary, and to rely on a rude estimate of its numbers, he well knew that his conclusions were but provisional. Yet they were far in advance of the general mind of his time. As late as 1694, and even in 1703, parliament substantially re-enacted the old law for valuing leases at seven years for each life. The meagre Breslau Table long remained the only serious attempt to utilize actual observations of mortality for scientific purposes. In 1746 A. de Parcieux (1703–1768), a mathematician of Paris, published an *Essai sur les probabilités de la durée de la vie humaine*, in which he presented mortality tables formed by himself, one from the records of certain Tontine associations, and five others from those of several religious orders in Paris. The Tontine experience table was a much closer approximation to the true course of mortality, as shown by later investigations, than any of its predecessors, and indeed now appears, despite the crude manner in which the materials were treated, to have been more accurate and more trustworthy than the Northampton or even the Carlisle Table of much later date. The essay of de Parcieux was an important source of information to advanced students in France and Germany, but attracted no general or popular interest, nor was it followed up by progressive researches of the same character in continental Europe, while it remained almost unnoticed in England.

Throughout the 18th century the customary treatment of life annuities was as chaotic and fanciful as before, though some writers of eminence, most notably Dr Thomas Simpson of London (1752), treated the theory of the subject with great intelligence, and in 1753 James Dodson of London (great-grandfather of Augustus de Morgan) projected a life insurance company in which the premiums should be accommodated justly to the ages of the insured. But life insurance as a business really began with the Equitable Society of London, founded in 1762. The associates petitioned for a charter, but the law officers of the crown refused it, saying that the scheme depended for success on the truth of certain tables of life and death, "Whereby the Chance of Mortality is attempted to be reduced to a certain standard. This is a mere speculation, never tried in practice." The society was organized as a voluntary association, and began business in 1765. Its premiums were computed from the Breslau Table, with some corrections from the London Bills of Mortality, and were far higher than any now in use. But the managers, in face of actual business, needed more light. Dr Richard Price, a student of the new science of life contingencies, was consulted, and soon devised tests of the society's experience and measures of the financial results, which are in principle those still practised. He also aspired to construct a more accurate table of mortality, and discovered data in certain parish registers of Northampton which promised to represent the average of life in England. From these he formed in 1780 the Northampton Table of Mortality, and computed a new and largely reduced scale of premiums for the society. The historical importance of the Northampton Table lies in the profound impression it made on the general mass of intelligent persons.

Northampton Table.

Although mortality had long been recognized by special inquirers as a promising theme for statistical inquiry, its actual treatment, except in the narrow school founded by Johann Süssmilch in Germany (1746), and in the isolated and almost prophetic work of de Parcieux in France, had been speculative and vague. Demoivre handled it with mathematical acuteness, but framed his scale of mortality (about 1750) on a hypothesis of his own, not on known facts. Out of each group of eighty-six deaths, according to this scale, one dies on the average each year till all are gone; so that x being the present age, the probability of death within a year is always $1/(86-x)$. This conjecture, which, during middle life, served as a rough approximation to the truth, almost as well as some of the early tables of repute, long found remarkable acceptance among men of science. Dr Price's researches first brought to general apprehension the conviction that a large basis of observed facts is the only source of real knowledge. The government of the day felt the influence of the movement. In 1786 Pitt, then chancellor of the exchequer, consulted Dr Price on plans for the conversion of debt, and in 1789 the government first showed knowledge that in granting annuities ages must be distinguished, and that the prospective life at ninety and that at twenty-five are not to be estimated as equal. About 1808 a conversion of 3% into annuities was planned. The Northampton Table was adopted, and Morgan computed rates from it which were used for twenty years. It proved to represent a mortality far in excess of the average, and in 1821 John Finlaison, being made actuary to the debt commissioners, protested against the rates in use. But not until 1828, when the treasury had lost two millions of pounds by selling annuities too cheap, was the law repealed. Finlaison then constructed a new and less wasteful scale for conversions, but singular results followed. At the age of ninety, for instance, £100 would purchase an annuity of £62. Combinations were formed to purchase annuities on the lives of old people selected for their vigour; 675 of these were taken, with a further loss of at least a million to the treasury. The Northampton Table, in fact, like the earlier Breslau Table, was formed without a census, and upon the false assumption that the population was stationary. Dr Price's estimate, founded on the recorded baptisms, was much too low, many of the people being of a sect which rejected infant baptism. His table represents an average life of twenty-four years, whilst subsequent inquiries indicate a true average of about thirty years at that time in the same parishes. The actual mortality in the Equitable Society proved to be less by one-third than that anticipated by the table. The error had consequences of vast moment. The immediate and dazzling prosperity of the societies founding rates on this supposed scientific basis excited the public imagination, stimulated the business exceedingly, and led to many extravagant projects, followed by fluctuations and failures which impaired its healthy growth and usefulness.

Recent actuarial progress.

In spite of gross defects, the Northampton Table remained for a century by far the most important table of mortality, employed as the basis of calculation by leading companies in Great Britain, and adopted by the courts as practically a part of the common law. Parliament, followed by some state legislatures and many courts in America, even made it the authorized standard for valuing annuity charges and reversionary interests. But in life insurance practice it is now wholly antiquated. Like its most famous successor, the Carlisle Table of Joshua Milne, it rested upon observations of the population of a town. How far this limited and peculiar group represented the nation was still doubtful; no less so how far the rate of mortality among applicants for insurance, accepted by the offices, would correspond with that of the urban citizens or of the whole body. As soon as the companies had sufficient records of their own experience the work began of striving to construct, for business use, tables which should truly express it. This branch of research has ever since been prosecuted with all the resources they could command of industry, practical judgment and mathematical skill; and the successive achievements in it may be accepted as in general the sum and measure of the progress of actuarial science. Now the recognition of an ascertainable uniformity in human mortality has become part of the general stock of thought. But actuarial science, which originated in Great Britain, was long the peculiar and almost exclusive possession of British students, and even till now has been practised most fruitfully in its first home, mainly by the actuaries of life insurance institutions, but with important contributions from other inquirers, especially those in the service of the registrar-general. The most complete storehouse of technical and practical learning on the general theory and on all its applications to life insurance practice is found in the successive volumes of the *Journal of the Institute of Actuaries*. The tables published by the Institute in 1872, founded on the experience to 1863 of twenty companies (see ANNUITY), still remain the most authoritative expression of the mortality of insured lives, and have largely replaced all earlier standards in the valuations of the British companies, more than three-fourths of which, in their latest returns to the Board of Trade, compute their reinsurance reserves by the $H^{m.}$ and $H^{m.5}$ tables. But for several years a committee of the Institute and of the Scottish Faculty of Actuaries has been engaged in collecting and arranging for investigation the far vaster experience which has now accumulated in the hands of sixty companies, including the records of more than a million policies. The large basis of facts thus obtained will be treated with special reference to different classes of risks, and will throw much light on difficult questions of selection, which have hitherto been treated speculatively, or at least without the conclusive evidence of large averages, and are still more or less in controversy. Some of these will require more detailed notice hereafter.

It is only since the middle of the 19th century that actuarial science has rapidly advanced in other countries, chiefly under the stimulus of the extending practice of life insurance. Both in America and upon the continent of Europe the small business transacted by the pioneer companies was largely conducted on empirical and conjectural methods from year to year, English custom being consulted as a guide in fixing premiums. The Gotha Bank, the first institution to insure lives upon business principles in Germany, adopted at its foundation in 1827 a mortality table formed by Charles Babbage upon the basis of the Northampton Table, corrected from cursory notes upon the early experience of the Equitable Society, which had been given by its actuary to a general meeting of its members in 1800. The French companies, and several in Germany of later origin than the Gotha, took as their standard the so-called Table of de Parcieux, previously described; and this table, with modifications dictated by experience, continued until very recently in general use in France. The Seventeen Companies' Table of 1843 was adopted by the Insurance Commissioners of Massachusetts, who in 1859 introduced the methods of state supervision of insurance now generally practised in the United States. This table, though long superseded in the esteem of actuaries in their ordinary work, is still the standard for official valuations in most states of the union, a fact which has given it undue prominence. The so-called American Table, derived in 1868 from the limited experience of the largest American company during its earliest years, was the first important work of the kind done in America. In view of its narrow basis of facts, it has stood the test of time singularly well, and it is now in wider use than any other for computing the premiums of American companies. Its most marked difference from the standard British tables for insured lives is that it indicates a decidedly lower rate of mortality throughout the period of mature manhood, between the ages of thirty-five and seventy-five, though with a higher rate at the extremes of life; and this peculiarity is also found in American tables deduced from more recent and far larger experience.

Actuarial science has been widely cultivated in the United States of late years, the numbers and zeal of its professional students having kept pace with the extraordinary growth of life insurance. The aggressive activity of the companies has brought the principles of the business home to the popular mind as in no other country, and a large number of periodicals are devoted entirely to the subject. These tendencies have been strengthened by the system of supervision practised by the states, which has also greatly influenced public opinion, directing attention in an extraordinary degree to certain special and technical features, to the neglect of more comprehensive and more useful criticism. In the official work of the state departments the actuary's province appears substantially to begin and end with the valuation of liabilities upon the net premium basis, which is applied with increasing strictness as the sole and final standard of solvency, and the determination by it of the "legal surplus" of each company. But a considerable number of professional actuaries have prosecuted their studies in a scientific spirit, and most of these since 1889 have been associated in the Actuarial

Society of America, which has established a high standard of professional competence in its examinations and transactions. The question how far the rate of mortality among insured lives in America is fairly represented by tables drawn from British experience has attracted much inquiry; and many companies have made important contributions to it from their own records, in several instances in the finished form of carefully graduated tables, each with an individual character, but all with some features which distinguish them as a group. By far the most comprehensive effort to establish a standard table for America is that of a committee of actuaries, for which, in 1881, L. W. Meech published the classified experience of thirty offices to the end of 1874, including most of the large companies in the United States, and embracing more than a million policies. The observations collected in this work have furnished materials for many important investigations, but the finished tables have rarely been applied in practice, being drawn from an aggregation of largely incongruous experiences, the influence of each of which upon the general average is indeterminate.

The business of life insurance upon the continent of Europe has given an extraordinary stimulus to actuarial studies. Before 1883 the German companies computed their premiums and reserves by antiquated life tables. The most approved of these, as illustrating the duration of German life, was that prepared by Brune of Berlin in 1837 from the records for seventy years of an annuity society for widows, which practised careful medical selection of the husbands and kept exact mortality registers. In 1883 was published an admirable table founded on the combined experience of twenty-three German companies, which has superseded all other standards for ordinary valuations within the German empire. The French companies generally continued to rely on the tables of de Parcieux, with modifications of their most glaring defects, until a still later date. In 1898 a committee of French actuaries published a new set of tables drawn from the experience of four of the principal offices in France, and these are now accepted as the best basis for life insurance practice by similar companies there. Schools of actuarial science have been opened in both Germany and France, and the professional actuaries of these countries, and of Austria and Belgium, have formed associations for the promotion of their pursuits. Sessions of delegates from the several institutes and societies of actuaries throughout the world meet triennially in general congress in the various capitals. Such sessions do much to broaden and harmonize the scope and aims of the profession.

Rates of mortality.

Elaborate efforts have been made by several governments to employ the machinery of census bureaus for determining the general rate of mortality, and it has been the worthy ambition of able actuaries to devise trustworthy methods of utilizing the census returns for this purpose. The British Statistical Office under Dr William Farr and his successors, and, later, the Swiss Federal Bureau of Statistics have accomplished the best work in this direction, and the series of "English Life Tables," founded on successive decennial censuses, interpreted by the registered deaths during the intervals, are the most useful data now available for the average value of civilized life. But all such general tables are as yet but tentative and provisional. The imperfections of mortuary registries and of census returns are great, and corrections are largely conjectural. Until more complete methods of collecting the facts are practised, the experience of life insurance companies promises to furnish the only mortality tables having claim to authority. It is already becoming evident that the general rate of mortality, and in particular the rate at each age of life, not only differs widely in different communities, but undergoes important changes in successive generations. A multitude of forces are at work in civilized society which must influence the average duration of life, such as the extension and concentration of many industries, the vast growth of cities, the progress of medical and hygienic science, the increase of wealth, comfort and luxury, the changes in the frequency and destructiveness of war. It is plausibly maintained, on the one hand, that these and other causes have already added some years to the average lifetime of civilized man; and, on the other hand, that their combined effect has been to lessen the sharpness of the struggle for existence, to rescue the weaklings from destruction and enable them to multiply, and so to weaken society at large. The final decision of the question will be found in the gradual modifications of the true table of mortality through successive epochs.

For the purposes of life insurance the future of mortality tables looks to less ambitious problems. The business calls for exact equity in determining the value of all life contingencies, and therefore for the most precise forecast attainable of the dates at which the amounts assured must be paid. Some idea of the historical progress of this inquiry may be gathered from the accompanying table, which epitomizes the general characteristics of a number of typical tables of mortality, showing at ages which are multiples of five years the annual death-rate indicated by each of them. The comparison will be found interesting in many ways, most strikingly, perhaps, as suggesting what is confirmed by a detailed examination of the facts, that insured life on the average in Great Britain is decidedly inferior to that in the United States, but superior to that upon the continent of Europe, and especially in Germany. From a careful investigation of the published experience, Dr McClintock concludes: "It is an ascertained fact that after the first five years of insurance the probability of death," in Great Britain, "is fully one-fifth greater at any given age than the corresponding probability shown by American experience"; while "the average value of assured life in Germany is as much inferior to that shown in the Hm. experience as that in America has been found to be superior."[1]

Table showing the number of Persons who will die in a year out of 100,000 who have attained the given Age, according to several Tables of Mortality.

Problems of selection.

No final explanation has been given, and there is no proof that the average life in America is longer than in England or Germany. Dr McClintock inclines to believe that one potent cause of the great difference in the insured experience is that, while European offices have generally awaited applications, which are commonly prompted by some sense of need for insurance, the custom of American companies is actively to solicit business through agents. On the average, lives which are only induced by persuasion to insure are better than those which voluntarily apply. That this suggestion points

[1] *On the Effects of Selection*, by Emory McClintock (New York, 1892), p. 94.

out a real and perhaps an important differentiating influence upon groups of risks is not doubted, but the measure of its effects has not yet been determined. The question is one of many which yearly assume more prominence, and which, as a class, are conventionally termed problems of selection. Assuming that the general rate of mortality is precisely known, any deviation from it occurring in a special group of insured lives, as the result of some influence peculiar to that group, is called the effect of selection. If insurance were offered on equal terms to all, the feeble and dying would apply in disproportionate numbers, and the mortality would be excessive. To avoid this danger careful medical examinations are required, excluding risks which appear to be impaired; and this selection by the insurer uniformly reduces the mortality below the general average during the earliest years of insurance. During these years large numbers of the insured withdraw, either from inability or from indisposition to pay their premiums, but the motive to do so is weakest with lives which have become impaired. The average vitality is lowered by the loss on the whole of a superior class, and the average mortality of those who persist rises. The extent of this influence varies widely with the proportionate number of lapses and the motives which induce them, increasing in a startling degree when lapses multiply in a discredited company, and remaining small, or even at times doubtful, under very favourable conditions; so that the ascertainment of its amount in different circumstances, and for different groups of the insured, is a problem of extreme complication. Its importance is increased by two tendencies which have grown stronger in the practice of recent years: first, to permit at all times the withdrawal by any policy-holder of a substantial part of the technical or average reserve upon his assurance, a privilege which legislation and public opinion in the United States have extorted from the companies; and, secondly, the extensive introduction, under competition for public favour, of forms of policies which grant the option, at fixed dates in the future, between withdrawing the entire "accumulations," or technical reserve and surplus, and continuing the insurance. It is well known that at the maturity of these options the motive is strong for impaired lives to remain insured, and that the cash withdrawals are so largely of superior lives that the subsequent rate of mortality is much increased. Other problems in selection arise from varieties in the forms of policies. It is commonly recognized that there are general and marked differences between the mortality experienced upon assurances issued at low and those at high premium rates. Policies for short terms, on which the computed net rates are the lowest, have been found so unprofitable to the insurers that they are rarely granted, and only with a very heavy loading of the tabular value. Upon those insured for life, with annual premiums, there is a large and constant excess of death losses above the endowment assurances, while groups of policies with tontine or cumulative features or reserved bonuses, available only after surviving a term of years, uniformly experience a low mortality.

It is also to be remarked that it is found in general that the average amount of policies matured by death is higher than the average of all policies in force; and some actuaries incline to believe that tables of pecuniary loss might, for practical use, take the place of tables of mortality, since the actual claims are in units of money, not of lives. The vast field of inquiry opened to actuaries by these and many more special questions of selection promises to engross more and more of their attention and labour. The technical methods of reducing and treating the data of mortality have been brought to a high degree of perfection, but the necessity for a better classification of the data themselves, with reference to special groups of lives or policies, differentiated by social or local circumstances, by business methods, by forms of contract, by race or personal characteristics, must assume ever greater prominence. It is conceivable that, at some period hereafter, the practical reliance of the offices will be more upon tables to be computed for such special groups, from select experience, than upon those drawn from vast aggregates without discriminating among their somewhat incongruous divisions.

The interest factor.

The mortality tables in common use, however, have been proved by a vast experience to furnish a safe and fairly equitable basis for the business of assuring lives. Assuming that the table shows how many of a large group now assured may be expected to end in each succeeding year, the present value of the claims upon them depends exclusively upon the rate of interest at which funds will accumulate. Exact foresight of this rate being impossible, the insurer must assume a rate which can with certainty be realized. The difficult problem of determining the limits of safety in this assumption attracts the more attention now, because of the recent persistent decline in the average productiveness of invested capital. The actuary is forced to observe that the interest factor in his calculations is much less definitely fixed by known facts than the mortality factor. The longer a contract has to run, the greater the effect of the difference in rate. The value of a payment to be made in thirty years is greater by above one-half with interest taken at 3% than at 4½%, and one to be made in thirty-six years is more than twice as great. Hence the most careful study of the forces determining for long periods the average rate of interest is fundamental in life insurance. The tendency of opinion is to hold that a progressive lowering of interest rates must result from the accumulation of wealth. In support of this belief it is pointed out that from 1872 nearly to the present time there has been a general and somewhat uniform decline in the yield of invested capital, as represented by government stocks, mortgage loans, savings bank deposits and discounts in all commercial nations. The movement has been disguised by wide fluctuations, temporary or local, but has been on the whole world-wide and continuous, when great masses of capital, such as the investments of life companies, are kept in view. The fall has been greatest, too, in countries where rates were formerly highest, suggesting that as the great financial markets of the world become more intimately connected the normal rate of interest assumes a more cosmopolitan character, with an increasing tendency to equality among them. These considerations have had an important influence upon the computations of life insurance companies. In Great Britain, and commonly in continental Europe, the leading offices from the first assumed lower rates of interest than those in America, usually 3½ or 3%; and the reductions in their estimates have as yet been moderate, only thirty-one out of seventy-four British offices having lowered the interest basis in their valuations reported to the Board of Trade.

These returns show that of these companies only twenty-three now compute reserves upon a rate as high as 3½%, while forty-four assume 3% and seven a still lower rate. But in America, when the business first became important, 6% was a more frequent rate of investment than 5%, and the laws of New York and of many other states countenanced the confident expectation of a permanent yield of at least 4½%. The rate of 4% adopted by the principal companies, and by the law of Massachusetts from 1861, was regarded as highly conservative. But as early as 1882 one important company began to reserve upon new business at 3%, and since 1895 there has been a gradual change by the leading offices to 3½%, and in a few instances to 3%, as the basis of premiums and of reserves upon new policies. Serious efforts have been made to induce legislation which will gradually establish one of these rates as a test of technical solvency.

There are not wanting, however, indications that the protracted decline in rates of interest in the world's markets may have been checked, and even that a reverse movement has begun. Rates of discount everywhere, interest on government loans except in America, and on mortgage loans in Europe, have on the whole advanced, the minimum average rates having been reached, after twenty-five years of gradual reduction, in 1897. These facts are entirely consistent with the conclusions suggested by the history of the subject. No uniform or secular tendency to reduction in the average rate of interest, which is the index of the average productiveness of capital, not of its amount, can be found to have prevailed. Fluctuations in the average rate are found, quite independent of the local and temporary fluctuations, which are often extreme; and these long tidal waves of change have at times, for generations together, risen and fallen with some approach to periodicity. The prevailing rate has been a little lower on the average in the 19th century than in the 18th, but was lower through the middle decades of the 18th century than through those of the 19th. On the whole, it seems clear that the accumulation of wealth in itself has no necessary tendency to diminish the productiveness of capital; that this productiveness, on the general average, has not materially varied in many generations; but that the promise and expectation of productiveness which prompt the demand for its use depend upon the activity of enterprise, growing out of the prevailing spirit of hope; upon the rapidity with which new inventions are made, industries extended, and floating or loanable capital expended in permanent works. These conditions are subject to fluctuations extending through considerable periods, so that for a number of years the rate may be higher, and then for a similar series of years lower than the normal rate, determined by average productiveness, but always tending to return to this normal rate, as the tide-swept surface of the ocean to its normal level.

While the excess of the average yield of capital in America, above that of the older nations, is diminished as the facilities of transfer and exchange increase, there is no reason to conclude that it will disappear for generations to come. It seems, therefore, that the general assumption of 3% for the valuation of British offices, and that of $3\frac{1}{2}$% which is becoming the accepted standard for the companies of the United States, should command unquestioned confidence.

Assets and reserve.

The business of life insurance being founded on well-ascertained natural laws, and on principles of finance which in their broad aspect are of the simplest description, there exists no necessity for frequent close scrutiny of the affairs of an insurance office, in so far as the maintenance of a mere standard of solvency is concerned. We have seen that the premiums charged for insurances are based on certain assumptions in regard to (1) the rate of mortality to be experienced, (2) the rate of interest to be earned by the office on its funds, and (3) the proportion of the premiums to be absorbed in expenses and in providing against unforeseen contingencies. If these assumptions are reasonably safe, an insurance office proceeding upon them may be confidently regarded as solvent so long as there is no conspicuously unfavourable deviation from what has been anticipated and provided for, and so long as the funds are not impaired by imprudent investments or otherwise. The ascertainment and division of profits, however, require that the affairs should be looked into periodically; but the fluctuations to which the surplus funds are liable within limited periods of time are generally regarded as furnishing a sufficient reason why such investigations should not take place too frequently. Accordingly in most offices the division of profits takes place only at stated intervals of years—usually five or seven years—when a complete survey is taken of the whole engagements present and future, and of the funds available to meet these. The mode in which the liability of an office under its current policies is estimated requires explanation.

All statistical observations on the duration of human life point to the conclusion that, after the period of extreme youth is past, the death-rate among any given body of persons increases gradually with advancing age. If, therefore, insurance premiums were annually adjusted according to the chances of death corresponding to the current age of the insured, their amount would be at first smaller, but ultimately larger, than the uniform annual payment required to insure a given sum whenever death may occur. This is illustrated by the following figures, calculated from the H^M mortality table at 3% interest. In column 2 is the uniform annual premium at age thirty for a whole-term insurance of £100. In column 3 are shown the premiums which would be required at the successive ages stated in column 1 to insure £100 in the event of death taking place within a year. Column 4 shows the differences between the figures in column 2 and those in column 3.

From this table it appears that if a number of persons effect, at the age of thirty, whole-term insurances on their lives by annual premiums which are to remain of uniform amount during the subsistence of the insurances, each of them pays for the first year £1·130 more than is required for the risk of that year. The second year the premiums are each £1·111 in excess of that year's risk. The third year the excess is only £1·093, and so it diminishes from year to year. By the time the individuals who survive have reached the age of fifty-four, their uniform annual premiums are

Age, $30+n$. (1)	P_{30}. (2)	$\lvert 1 A_{30+n}$. (3)	$P_{30}-\lvert 1 A_{30+n}$. (4)
30	£1·880	£·750	+£1·130
31	1·880	·769	+ 1·111
32	1·880	·787	+ 1·093
..	..	..	..
..	..	..	..
..	..	..	..
53	1·880	1·806	+ ·074
54	1·880	1·916	− ·036
55	1·880	2·042	− ·162
..	..	..	..
..	..	..	..
..	..	..	..
95	1·880	61·848	−59·968
96	1·880	79·265	−77·385
97	1·880	97·087	−95·207

no longer sufficient for the risk of the following year; and this annual deficiency goes on increasing until at the extreme age in the table it amounts to £95·207, the difference between the uniform annual premium (£1·880) and the present value (£97·087) of £100 certain to be paid at the end of a year. Now, since the uniform annual premiums are just sufficient to provide for the ultimate payment of the sums insured, it is obvious that the deficiencies of later years must be made up by the excess of the earlier payments; and, in order that the insurance office may be in a position to meet its engagements, these surplus payments must be kept in hand and accumulated at interest until they are required for the purpose indicated. It is, in effect, the accumulated excess here spoken of which constitutes the measure of the company's liability under its policies, or the sum which it ought to have in hand to be able to meet its engagements. In the individual case this sum is usually called the "reserve value" of a policy.

In another view the reserve value of a policy is the difference between the present value of the engagement undertaken by the office and the present value of the premiums to be paid in future by the insured. This view may be regarded as the counterpart of the other. For practical purposes it is to be preferred as it is independent of the variations of past experience, and requires only that a rate of mortality and a rate of interest be assumed for the future.

According to it, the reserve value (${}_nV_x$) of a policy for the sum of 1, effected at age x, and which has been in force for n years—the $(n+1)$th premium being just due and unpaid—may be expressed thus, in symbols with which we have already become familiar.

$$ {}_nV_x = A_{x+n} - P_x(1+a_{x+n}) \quad . \quad . \quad . \quad (1).$$

If we substitute for A_{x+n} its equivalent $P_{x+n}(1+a_{x+n})$ this expression becomes

$$ {}_nV_x = (P_{x+n} - P_x)(1+a_{x+n}) \quad . \quad . \quad . \quad (2);$$

whence we see that the sum to be reserved under a policy after any number of years arises from the difference between the premium actually payable and the premium which would be required to assure the life afresh at the increased age attained. By substituting for P_{x+n} and P_x their equivalents $\frac{1}{1+a_{x+n}}-(1-v)$ and $\frac{1}{1+a_x}-(1-v)$, we obtain another useful form of the expression,

$$ V_x = 1 - \frac{1+a_{x+n}}{1+a_x} \quad . \quad . \quad . \quad . \quad (3)$$

$$ = \frac{a_x - a_{x+n}}{1+a_x} \quad . \quad . \quad . \quad . \quad . \quad (4).$$

Net liability.

The preceding formulae indicate clearly the nature of the calculations by which an insurance office is able to ascertain the amount of funds which ought to be kept in hand to provide for the liabilities to the assured. In cases other than whole-term insurances by uniform annual premiums, the formulae are subject to appropriate modifications. When there are bonus additions to the sums insured, the value of these must be added, so that by the foregoing formula (1), for example, the value of a policy for 1 with bonus additions B is $(1+B)A_{x+n} - P(1+a_{x+n})$. But the general principles of calculation are the same in all cases. The present value of the whole sums undertaken to be paid by the office is ascertained on the one hand, and on the other hand the present value of the premiums to be received in future from the insured. The difference between these (due provision being made for expenses and contingencies, as afterwards explained) represents the "net liability" of the office. Otherwise the net liability is arrived at by calculating separately the value of each policy by an adaptation of one or other of the above formulae. In either case, an adjustment of the annuity-values is made, in order to adapt these to the actual conditions of a valuation, when the next premiums on the various policies are not actually due, but are to become due at various intervals throughout the succeeding year.

Provision for expenses, &c.

So far in regard to the provision for payment of the sums contained in the policies, with their additions. We now come to the provision for future expenses, and for contingencies not embraced in the ordinary calculations. In what is called the "net-premium" method of valuation, this provision is made by throwing off the whole "loading" in estimating the value of the premiums to be received. That is to say, the premiums valued, in order to be set off against the value of the sums engaged to be paid by the office, are not the whole premiums actually receivable, but the net or pure premiums derived from the table employed in the valuation. The practical effect of this is that the amount brought out as the net liability of the office is sufficient, together with the net-premium portion of its future receipts from policyholders, to meet the sums assured under its policies as they mature, thus leaving free the remaining portion—the margin or loading—of each year's premium income to meet expenses and any extra demands. When the margin thus left proves more than sufficient for those purposes, as under ordinary circumstances it always ought to do, the excess falls year by year into the surplus funds of the office, to be dealt with as profit at the next periodical investigation.

Net-premium method.

There appears to be a decided preference among insurance companies for the net-premium method as that which on the whole is best suited for valuing the liabilities of an office transacting a profitable business at a moderate rate of expense, and making investigations with a view to ascertaining the amount of surplus divisible among its constituents. In certain circumstances it may be advisable to depart from a strict application of the characteristic feature of that method, but it must always be borne in mind that any encroachment made upon the "margin" in valuing the premiums is, so far, an anticipation of future profits. Any such encroachment is indeed inadmissible, unless the margin is at least more than sufficient to provide for future expenses, and in any case care must be taken to guard against what are called "negative values." These arise when the valuation of the future premiums is greater than the valuation of the sums engaged to be paid by the office, or when in the expression $(P_{x+n} - P_x)(1+a_{x+n})$ the value of P_x is increased so as to be greater than that of P_{x+n}. It is evident that any valuation which includes "negative values" must be misleading, as policies are thereby treated as assets instead of liabilities, and such fictitious assets may at any time be cut off by the assured electing to drop their policies.

Negative values.

In recognition of the fact that a large proportion of the first year's premiums is in most offices absorbed by the expense of obtaining new business, it has been proposed by some actuaries to treat the first premium in each case as applicable entirely to the risk and expenses of the first year. At a period of valuation the policies are to be dealt with as if effected a year after their actual date, and at the increased age then attained.

Another modification of the net-premium method has been advocated for valuing policies entitled to bonus additions. It consists in estimating the value of *future* bonuses (at an assumed rate) in addition to that of the sum assured and *existing* bonuses, and valuing on the other hand so much of the office premiums as would have been required to provide the sum assured and bonuses at the time of effecting the insurance. This tends to secure, to some extent, the maintenance of a tolerably steady rate of bonus.

Hypothetical method.

An essentially different method is employed by some offices, and is not without the support of actuaries whose judgment is entitled to every respect. It has been called the "hypothetical method." By it the office premiums are made the basis of valuation. Hypothetical annuity-values, smaller than those which would be employed in the net-premium method, are deduced from the office premiums by means of the relation $P' = \frac{1}{1+a'} - (1-v)$, and the policies are valued according to the formula

$$_nV'_x = (P'_{x+n} - P'_x)(1+a'_{x+n}),$$

where P'_x and P'_{x+n} are the office premiums at ages x and $x+n$ respectively, and a'_{x+n} is the hypothetical annuity-value at the latter age. Mr Sprague has shown (*Ass. Mag.* xi. 90) that the policy-values obtained by this method will be greater or less than, or equal to, those of the net-premium method according as the "loading" is a constant percentage of the net premium or an equal addition to it at all ages, or of an intermediate character, its elements being so adjusted as to balance each other.

When the net-premium method is employed, it is important that the office premiums be not altogether left out of view, otherwise an imperfect idea will be formed as to the results of the valuation. Suppose two offices, in circumstances as nearly as possible similar, estimate their liabilities by the net-premium method upon the same data, but office A charges premiums which contain a margin of 20% above the net premiums, and office B charges premiums with a margin of 30%. Then, in so far as regards their net liabilities (always supposing the sum set aside in each case to be that required by the valuation), the reserves of those offices will be of equal strength, and if nothing further were taken into account they might be supposed to stand in the same financial position. But it is obvious that office B, which has a margin of income 50% greater than that of office A, is so much better able to bear any unusual strain in addition to the ordinary expenditure, and is likely to realize a larger surplus on its transactions. Hence it appears that in order to obtain an adequate view of the financial position of any office it is necessary to consider, not only the basis upon which its reserves are calculated, but also the proportion of "loading" or "margin" contained in its premiums, and set aside for future expenses and profits.

Effects of different data.

Valuations may be made on different data as to mortality and interest, and the resulting net liability will be greater or less according to the nature of these. Under any given table of mortality a valuation at a low rate of interest will produce a larger net liability—will require a higher reserve to be made by the office against its future engagements to the insured—than a valuation at a higher rate. The effect of different assumptions in regard to the rates of mortality cannot be expressed in similar terms. A table of mortality showing a high death-rate, and requiring consequently large assurance premiums, does not necessarily produce large reserve values. The contrary, indeed, may be the case, as with the Northampton Table, which requires larger premiums than the more modern tables, but gives on the whole smaller reserve values. The amount of the net liability depends, not on the absolute magnitude of the rates of mortality indicated by the table, but on the ratio in which these increase from age to age.

If the values deduced by the net-premium method from any two tables be compared, it will be seen that

$$V'_x >, =, \text{ or } < {}_nV_x$$

according as

$$1 - \frac{1+a'_{x+n}}{1+a'_x} >, =, \text{ or } < 1 - \frac{1+a_{x+n}}{1+a_x}$$

i.e. as

$$\frac{1+a_{x+n}}{1+a_x} >, =, \text{ or } < \frac{1+a'_{x+n}}{1+a'_x} \quad . \quad . \quad . \quad (1),$$

or as

$$\frac{1+a'_x}{1+a_x} >, =, \text{ or } < \frac{1+a'_{x+n}}{1+a_{x+n}} \quad . \quad . \quad . \quad (2);$$

where the accented symbols throughout refer to one table and the unaccented symbols to the other.

We have thus the means of ascertaining whether the policy-values of any table will be greater or less than, or equal to, those of another, either (1) by calculating for each table separately the ratios of the annuity-values at successive ages, and comparing the results, or (2) by calculating at successive ages the ratios of the annuity-values of one table to those of another, and observing whether these ratios decrease or increase with advancing age or remain stationary throughout. The above relations will subsist whatever may be the differences in the data employed, and whether or not the annuity-values by the different tables are calculated at the same rate of interest. When the same rate of interest is employed, any divergence in the ratios of the annuity-values will of necessity be due to differences in the rates of mortality.

Fallacy of single-policy reserve.

A prevailing fallacy in the popular mind, which has grown out of the practice of net valuations, is the inference that the average technical reserve represents the value of the individual policy. Each risk is properly assumed at its probable or average value at the time. But from that moment its circumstances are constantly changing in directions then unforeseen, and the expectation that such changes will occur is the motive for insuring. To treat them singly as unchanged in value at any later time is as illogical as it would be after some have matured. The actual value of any one risk borne by a company is indeterminate. It may become a claim to-morrow, or not for a generation to come. In the former case the company must now hold funds to pay in full; in the latter, the future premiums will perhaps more than suffice, so that no present reserve is needed. An entire reserve for the whole body of risks is essential, and its amount is definite, upon the reasonable assumption that the general average remains undisturbed by individual changes. A distinct reserve for a single policy is inconceivable. To recognize it is to deny the first principle of insurance. The average amount by which the reserve of a company must be increased, because of the existence of policies of a given class, is to the actuary an important fact, and is commonly accepted as his best guide in the distribution of surplus. But a popular theory has seized upon the assignment of this average sum to each policy, in the technical shorthand of the actuary, and holds that it is in each case the special property of the owner of that policy. The practical consequences are serious when, as often, many of the insured cease to pay premiums, and each demands the amount of the supposed individual reserve. His right to claim it is countenanced by a widespread public opinion, which has inspired statutes in Massachusetts and some other states, requiring companies to redeem all policies lapsing after the first two or three years of insurance at a price founded on the technical reserve. Yet, in by far the majority of instances, the lapse of policies is of itself a loss to the company. It is deprived of business secured at much expense before it has derived any of the advantage expected from the accession. It is compelled to pay numbers of its profitable contributors for ceasing to contribute. The burden falls in a mutual company upon the insured who fulfil their contracts. Such laws favour those who withdraw after few payments at the cost of those who maintain their insurance to the end, or for many years. The American companies formerly yielded to the pressure of a mistaken public sentiment, and competed for favour by promising excessive values in case of surrender.[1] Similar conditions exist in Switzerland, Austria, and other countries in which the business is minutely regulated by government bureaus. But in Great Britain the companies are largely free from such influences, while an open market exists for policies which have a commercial value, with results on the whole more satisfactory to all parties interested than any rule of compulsory purchase which could be enforced on the companies.

Industrial Insurance. A special form of life insurance, which has wonderfully developed, is the family insurance of the labouring people by the so-called industrial companies. Until recently this class of people had no satisfactory share in the benefits of insurance, although the friendly societies in Great Britain, and many forms of beneficial associations in the United States, were attempts, often in part successful, to provide for special wants, mainly for maintenance of the sick and for the costs of burial. Most of them, however, lacked a scientific basis and an efficient and permanent organization, while thousands of them were grossly mismanaged. In Germany an elaborate scheme of compulsory insurance for labourers was established by a law of the empire in 1883, and extended in subsequent years; and similar legislation has been enacted in several other countries, most thoroughly in Switzerland and Austria. The ultimate value of this great social experiment cannot yet be determined. That it relieves much want and does a great service in preventing pauperism is not disputed; but that it also undermines the independent spirit of the people, and that it imposes a burden upon the national industry, which not only hampers it in the world's competition, but reacts with special injury upon the class it aims to benefit, are criticisms not satisfactorily answered. No scheme of government insurance, certainly, is adapted to a people impatient of paternalism in its rulers and thoroughly habituated to voluntary association for all common interests. The solution of the great problem, how to apply the insurance principle to the most pressing needs for protection of the class supported by the wages of labour, is now sought in Great Britain and America mainly in the universal offer to them of industrial insurance. The Prudential Assurance Company of London was the pioneer in this work, beginning it experimentally in 1848, but gradually adapting its methods to the new field, until a generation later they showed themselves so efficient that an extraordinary growth resulted, and has continued without interruption. This company and others upon a similar plan insure whole households together for burial expenses in case of death, and a small provision for dependants or for old age, charging as premiums small fractions of a day's wages, which must be collected weekly. The great difficulties encountered were the cost of small and frequent collections, and the high rate of mortality, which is from 40 to 90% more than that in the experience of the older companies. This high death-rate is due not so much to the fact that life is shorter in the labouring class as to the lack of efficient medical selection, which would be too costly. The premiums, at best, must be made higher than in offices insuring for annual payments, but the demand for insurance extended as rapidly as the system could be explained, and the Prudential is said to have now in force some 12,000,000 policies, with an average premium of twopence a week, secured by an accumulated insurance fund of £17,000,000. It has superseded a host of petty assessment societies of various classes without scientific basis or business responsibility, which deluded and disappointed the poor. The British government in 1864 undertook to administer a plan for the insurance of working men, but in thirty years accomplished less than the work of one private company in a year. In addition to the many insurance companies which transact industrial business in the United Kingdom, a large number of friendly societies have adopted similar plans.

The system of industrial insurance was introduced into the United States in 1876. Its growth, though much more rapid than in Great Britain, was at first slow compared with that of later years. The following table, condensed from the *Insurance Year-Book for 1900*, is an interesting exhibit of the character as well as of the extent of this form of insurance among working men:—

Industrial Insurance in the United States.

Year.	No. of Cos.	Insurance written.	Policies in force 31st December.	Insurance in force 31st December.	Premiums received.	Losses paid.
1876	1	$400,000	2,500	$248,342	$14,495	$1,958
1880	3	34,212,131	228,357	19,590,780	1,155,360	430,631
1884	3	89,150,302	1,076,422	108,451,099	4,486,612	1,499,432
1888	7	161,260,335	2,788,000	302,033,066	11,939,540	4,162,745
1892	11	276,893,923	5,118,897	582,710,309	24,352,900	8,847,322
1896	11	360,852,458	7,375,688	886,484,869	40,058,701	13,420,336
1899	16	519,789,085	10,048,625	1,292,805,402	56,159,889	17,023,485

It is remarkable that the average weekly premium in the United States appears to be about 10 cents, or two and a half times as high as in Great Britain. The average policy is also proportionally larger, and the progressive increase in its amount deserves notice. At the rate at which the practice of insurance is extending among working men, it would require but few years for it to become as universal in these countries as any paternal government has aimed to make it by compulsion.

There are various sources from which a surplus of funds may arise in an insurance company: (1) from the rate of interest actually earned being higher than that anticipated in the calculations; (2) from the death-rate among the insured

[1] As a result of investigation into the affairs of various American insurance companies in 1905 by a committee appointed by the state legislature of New York, a new law regulating life insurance down to the minutest details was passed in 1906 (ch. 326). The surrender value of a policy is to be the amount of insurance which the reserve, computed on the $4\frac{1}{2}$% mortality table, standing to its credit, will purchase as a single premium. Other important features of the legislation are that no New York company may hold a contingency reserve beyond a fixed proportion of the net value of its policies; the limiting of types of policies permitted, the defining of the nature of investments permitted, and provisions for state supervision, valuation, and annual division of profits.

being lower than that provided for by the mortality tables; (3) from the expenses and contingent outlay being less than the "loading" provided to meet them; and (4) from miscellaneous sources, such as profitable investments, the cancelment of policies, &c.

Division of surplus.

Supposing a valuation to have been made on sound data and by a proper method, and to have resulted in showing that the funds in hand exceed the liabilities, the surplus thus ascertained may be regarded as *profit*, and either its amount may be withdrawn from the assets of the office or the liabilities may be increased in a corresponding degree.

Various methods are employed by insurance companies in distributing their surplus funds among the insured. In some offices the share or "bonus" falling to each policyholder is paid to him in cash; in others it is applied in providing a reversionary sum which is added to the amount assured by the policy; in others it goes to reduce the annual contributions payable by the policyholder. A method of more recent introduction is to apply the earlier bonuses on a policy to limit the term for which premiums may be payable, thus relieving the policyholder of his annual payments after a certain period. Another method is to apply the bonuses towards making the sum insured payable in the lifetime of the policyholder. The plan of reversionary bonus additions is most common, and when it is followed the option is usually given of exchanging the bonuses for their value in cash or of having them applied in the reduction of premiums.

Bonuses.

Not only are there different modes of applying surplus, but the basis on which it is divided among the insured also varies in different offices. In some the reversionary bonus is calculated as an equal percentage per annum of the sum insured, reckoning back either to the commencement of the policy in every case, or (more commonly) to the preceding division of profits. In others the rate is calculated, not only on the original sums insured, but also on previous bonus additions. In others the ratio of distribution is applied to the cash surplus, and the share allotted to each policy is dealt with in one or other of the ways above indicated. The following are some of the ratios employed by different offices in the allocation of profits: (1) in proportion to the amount of premiums paid (with or without accumulated interest) since the last preceding valuation; (2) in proportion to the accumulated "loading" of the premiums so paid; (3) in proportion to the reserve values of the policies; (4) in proportion to the difference between the accumulated premiums and the reserve value of the policy in each case.

Some offices have a special system of dealing with surplus, reserving it for those policyholders who survive the ordinary "expectation of life," or whose premiums paid, with accumulated interest, amount to the sums insured by their policies. This system is usually connected with specially low rates of premium.

In the United States the so-called "contribution plan" has been accepted in theory by many companies, though carried out with many variations in detail by different actuaries. The principle is, that since each of the insured is charged in his premium a safe margin above all probable outlays, when the necessary amount under each head becomes determinate the several excesses should be returned to him. It is therefore sought to calculate what each member would have been charged for net premium and loading had the mortality, rate of interest, and expenses been precisely known beforehand, and to credit him with the balance of his payments. As a corollary of the theory of net valuations, which regards every life insured as an average life until its end, and assumes the rigid accuracy and equity of all the formulas employed to represent business facts, it is consistent and complete. But many minds find it more curious than practical, and prefer to seek equity in faithfulness to contract rights rather than in adjustments which they deem too refined, if not fanciful. The plan has met with little favour in England, where surplus is more commonly distributed on general business principles. Enormous bonuses were saved by the British offices out of the excessive premiums at first collected, and by the American companies during the epoch of high interest rates. But the use of more accurate tables, the decline in interest, and the increased expenses of later years, have vastly reduced the apparent profits. Former methods of distributing surplus, when ascertained, have largely given way in America to novel and more complex plans. The Tontine idea, historically familiar, was for many years imitated by some offices in their insurance contracts. All premiums above outlay, in a company or a class of policies, were accumulated, only stipulated amounts being paid on death claims meanwhile maturing, with no compensation to its members withdrawing, until the end of a fixed term, when the whole fund was apportioned to the survivors. Large returns were sometimes made, but many who could not maintain their policies were dissatisfied. "Semi-tontines" followed, partly meeting the difficulty by pooling only the surplus, and allowing some return in case of withdrawal. But these cruder forms of contract are now largely superseded by various "reserve-dividend," "accumulation," "bond," and "investment" policies, with options at stated periods between cash withdrawals and continued insurance, the simple inducement to provide against death being more or less merged in that of making a profitable investment of capital.

In those branches of insurance where the contract is one of indemnity against loss, the risk remaining the same from year to year—and where the consent of both parties, insurer and insured, is required at each periodical renewal—no question of allowance in respect of past payments can arise when one party or the other determines to drop the contract. It is quite recognized that the premiums are simply an equivalent for the risk undertaken during the period to which they apply, with a certain margin for expenses and for profit to the insurer, and that therefore a favourable issue of the particular contract supplies no argument for a return of any part of the sums paid. In life insurance, however, we have shown that the premiums contain a third element, namely, the portion that is set aside and accumulated to meet the risk of the insurance when the premium payable is no longer sufficient of itself for that purpose.

Surrender values.

When a policyholder withdraws from his contract with a life insurance office, the provision made for the future in respect of his particular insurance is no longer required, and out of it a surrender value may be allowed him for giving up his right to the policy. If there were no reasons to the contrary, the office might hand over the whole of this provision, which is in fact the reserve value of the policy. No more could be given without encroaching upon the provision necessary for the remaining policies. But the policyholder in withdrawing is exercising a power which circumstances give to him only and not to the other party in the contract. The office is bound by the policy so long as the premiums are duly paid and the other conditions of insurance are not infringed. It has no opportunity of reviewing its position and withdrawing from the bargain should that appear likely to be a losing one. The policyholder, however, is free to continue or to drop the insurance as he pleases, and it may fairly be presumed that he will take whichever course will best serve his own interest. The tendency obviously is that policies on deteriorated and unhealthy lives are kept in force, while those on lives having good prospects of longevity are more readily given up. Again, the retiring policyholder, by withdrawing his annual contribution, not only diminishes the fund from which expenses are met, but lessens the area over which these are spread, and so increases the burden for those who remain. Considerations like these point to the conclusion that, in fairness to the remaining constituents of the office, the surrender value to be allowed for a policy which is to be given up should be less than the reserve value. The common practice is to allow a proportion only of the reserve value. Some offices have adopted the plan of allowing a specified proportion of the amount of premiums paid. This plan is not defended on any ground of principle, but is followed for its simplicity and as a concession to a popular demand for fixed surrender values.

Another mode of securing to retiring policyholders the benefit of the reserve values of their insurances is that known as the *non-forfeiture system.* This system was first introduced in America, whence it found its way to the United Kingdom, where it was gradually adopted by a large proportion of the insurance companies. In its original form it was known as the "ten years non-forfeiture plan." The policies were effected by premiums payable during ten years only, the rates being of course correspondingly high. If during those ten years the policyholder wished to discontinue his payments, he was entitled to a free "paid-up policy" for as many tenth parts of the original sum insured as he had paid premiums.

Non-forfeiture system.

The system, once introduced, was gradually extended first to insurances effected by premiums payable during longer fixed periods, and ultimately, by some offices, to insurances bearing annual premiums during the whole of life. The methods of fixing the amount of paid-up policy in the last-mentioned class of cases vary in different offices, but the principle underlying them all is that of applying the reserve value to the purchase of a new insurance of reduced amount.

Conditions of insurance.

An office, in entering on a contract of life insurance, does so in the faith that all circumstances material to be known in order to a proper estimate of the risk have been disclosed. These circumstances are beyond its own knowledge, and as the office for the most part (except as regards the result of the medical examination, which may reveal features of the case unknown to the proposer himself) is dependent on the information furnished by the party seeking to effect the insurance, it is proper that the latter be made responsible for the correctness of such information. Accordingly it is made a stipulation, preliminary to the issue of every policy, that all the required information bearing upon the risk shall have been truly and fairly stated, and that in case of any misrepresentation, or any concealment of material facts, the insurance shall be forfeited. In practice, however, this forfeiture is rarely insisted on unless there has been an evident intention to deceive. Other systems and conditions of life insurance policies may be shortly noticed.

The usual division of policies is into "non-participating" and "participating." Non-participating policies are contracts for the payment on death of a certain fixed sum in consideration of a given premium, and these amounts are not affected by the profit made by the company. Participating policies entitle the holders to a share in the profits of the company. These profits are applied in various ways, as described above. A policy may be a whole life one, that is, the policyholder may pay a periodical premium throughout life, or it may be a limited payment one (the holder paying a premium for a limited number of years), or an endowment policy, under which the insurer receives the amount he has insured for at a given age, say fifty-five or sixty; or if death occur previously, the sum is paid to his representatives. There are also endowment policies for children, under which parents or others receive a specified sum on a child attaining a given age, the premiums being returnable if the child dies before the specified age.

As to Payment of Premiums.—A certain period of grace is allowed, most commonly thirty days, after each premium falls due. If payment is not made within that time, the presumption is that the policyholder intends to drop the contract, and the risk of the office comes to an end. It may, however, be revived on certain conditions, usually the production of evidence of health and payment of a fine in addition to the premium. An impression used to prevail among the public that the offices were interested in encouraging the forfeiture of policies. If any such impression was ever shared by the offices themselves it must have long since passed away, every reasonable effort being now made on their part, not only to secure insurances but to retain them, and to afford all the facilities that can be extended to policyholders with that object.

As to Foreign Travel and Residence, and as to Hazardous Occupations.—When Babbage wrote his *Comparative View of Assurance Institutions* in 1826, voyaging abroad was scarcely permitted under a British life policy. The Elbe and the Garonne, Texel and Havre, Texel and Brest, the Elbe and Brest were the limits prescribed by most of the English offices. Even at a much later period the extra premiums charged for leave to travel or reside abroad were very heavy. But improved means of conveyance—in some places better sanitary appliances, and habits of living more suited to the climatic conditions—and, more than all perhaps, the knowledge that has been gained by experience as to the extent of the extra risks involved and the relative salubrity of foreign climates—have enabled the offices to modify their terms very considerably. The limits of free residence and travel have been greatly widened, and where extra premiums are still required these are, as a rule, much lower than formerly. The assured are now commonly permitted to reside anywhere within such limits as north of 35° N. lat. (except in Asia) or south of 30° S. lat., and to travel to and from any places within those limits, without extra premium.

Military men (when on active service) and seafaring men are usually charged extra rates, as are also persons following specially dangerous or unhealthy occupations at home.

As to Suicide.—The policies of most companies used to contain a proviso that the insurance shall be void in case the person whose life is insured dies by his own hand, but it is now seldom inserted. Some offices, acting on a sound principle, limit its operation to a fixed period, the extent of which varies in different offices from six months to seven years from the date of issue of the policy.

The practice of rendering policies *indisputable* and free from restriction as to foreign travel or residence, after a certain period, has tended greatly to simplify the contract between the office and the insured. A declaration of indisputability covers any inaccuracies in the original documents on which a policy was granted, unless these inaccuracies amount to fraud, which the law will not condone under any circumstances.

A remarkable difference in the development of life insurance between Great Britain and the United States is, that among the British companies only one-third of the insurances in force is in purely mutual institutions, while in America the proportion exceeds four-fifths. In both countries there are also "mixed" companies, in which policyholders receive a fixed percentage of the realized surplus, often from three-fourths to nine-tenths of the whole, but the control and management are in the hands of shareholders. These form the great majority of the proprietary offices in the United Kingdom, and the profits of the business have been large. The amount of capital paid in by shareholders of forty-one joint-stock companies was £5,931,000, but the capital authorized and subscribed was much more, and the subscriptions have often been paid, wholly or in part, by credits from surplus. The shares of these companies, at market prices, represent a value of at least £50,000,000, but the dividends upon these shares are drawn largely from other business, many of the largest and most prosperous corporations conducting also fire insurance, and some of them marine or casualty insurance.

No branch of social statistics has been more diligently studied than life insurance, and several governments publish classified accounts of corporations insuring lives within their jurisdiction. But the reports are not uniform in method and in periods covered, and aggregates derived from them must be used with reserve. By the Life Assurance Companies Act 1870, and amendments made in later years, each company issuing policies in the United Kingdom must deposit with the Board of Trade every year its revenue account and balance-sheet for the preceding year, and must at fixed intervals cause an investigation of its financial condition to be made by an actuary, and furnish the public through the Board of Trade with the detailed results, in forms prescribed by the act. Thus these returns are the highest authority for the conditions and operations of the offices, which often supplement or anticipate them by voluntary publications. In the United States the laws exact still more minute and much prompter reports to the insurance departments of the states; and every annual statement is required to show the results of an actuarial investigation. All these facts are collected, classified and compared by statisticians for several standard annuals in both countries, especially the *Post Magazine Almanack*, *Bourne's Directory* and *Manual* and the *Insurance Blue Book* in London, and *The Insurance Year-Book* of the Spectator Company in New York.

The reports of the insurance department of New York cover more companies than those of any other state. The institutions not included in them are about thirty-five in number, mostly small and local. The New York reports represent very nearly 95% of the entire business of the United States. While the amount of life assurance done by British and other foreign offices in the United States is insignificant, fourteen companies of the United States have agencies in Canada (ten for new business), and four transact business in Europe and in other parts of the world. The home business of the American companies is in the aggregate about 87½% of the whole.

In the principal countries of continental Europe life assurance is offered by the chief international institutions of Great Britain and the United States, and their policies are in force probably to the aggregate amount of £140,000,000. The domestic companies have been stimulated to increased activity by the aggressive canvassing of the foreign agencies, and the business in recent years has grown rapidly, until now the total sum insured upon lives on the continent of Europe is little less than a milliard of pounds sterling. Much information about life assurance in the different countries of Europe will be found in Ehrenzweig's *Assekuranzjahrbuch* (Vienna).

(C. T. L.; T. A. I.)

V. British Post Office Insurance

In 1864 Mr Gladstone, then chancellor of the exchequer, advocated the extension of life insurance amongst persons of small means, and, encouraged by the remarkable success of the

Post Office Savings Bank, then recently established, proposed that the services of the postmaster-general should be enlisted in the promotion of insurance. The result was the passing of the Government Annuities Act 1864. This act authorized the commissioners for the reduction of the national debt, for the first time, to insure a life without granting an annuity upon it, and enabled the postmaster-general to act as the agent of the commissioners in the issue of life policies and the grant of annuities. The limits of insurance were fixed at £20 and £100, and of annuities at £4 and £50; and the purchase of deferred annuities or old-age pay, by monthly, or even more frequent instalments, was sanctioned. The work was eagerly accepted by Lord Stanley of Alderley, the postmaster-general of the day, and the machinery for putting the act in action was elaborated by Frank Ives Scudamore of the Post Office and Sir Alexander Spearman of the National Debt office. The business was commenced on the 17th of April 1865. By the end of the year 560 policies of insurance had been issued, and 94 immediate and 54 deferred annuities granted. In the first twelve months these figures had increased to 809 policies and 230 annuities. The opportunity thus given of insuring through the Post Office with government security was not, however, embraced with the warmth which had been anticipated. In 1882, when Mr Henry Fawcett, then in office, examined the subject, he found that the average number of policies of insurance granted annually during the seventeen years which had elapsed was under 400—less, in fact, than during the first twelve months of the system. The purchase of annuities had increased slightly, but the business was transacted chiefly in immediate annuities, and hardly indicated any progress in provision for old age by means of early savings. Mr Fawcett procured a Select Committee of the House of Commons on the subject. Before this committee Mr James Cardin, then assistant receiver and accountant-general of the Post Office, propounded a scheme for combining the annuity and insurance business of the Post Office with that of the savings bank. The Committee recommended the adoption of this scheme, together with some enlargement of range and some relaxation of conditions. The recommendations of the Committee were embodied in the Government Annuities Act 1882, which came into operation on the 3rd of June 1884, and which forms the basis of the present system.

Any person between 14 and 65 can now insure through the medium of the Post Office Savings Bank for any amount from £5 to £100; and the life of a young person between 8 and 14 can be insured for £5. Through the same channel can be purchased annuities, immediate or deferred, from £1 to £100, on the life of any person from 5 years old upwards. Old-age policies, that is, policies securing payment of a specific sum either at the expiration of a fixed period (varying from 10 to 40 years), or upon the attainment of a certain age, or sooner in case of death, can also be obtained. Policies for a fixed period can only be purchased by a single payment, but in all other cases the purchase can be effected by payment either of a lump sum or of annual instalments. Further, all purchases are effected through the Post Office Savings Bank. As soon as a contract is completed, the purchaser is required to pay the first instalment to his account in the bank, or, if he has no account already, to open an account for the purpose. This and all further instalments are then transferred by the postmaster-general, as they become due, to the credit of the National Debt Commissioners; all the purchaser has to do is to keep his banking account in funds; he can pay his savings into the bank when and as he pleases. So, also, when old-age pay, secured either by a deferred annuity or an endowment policy, becomes due, it is paid to the account of the purchaser; and, if it does not cause the sum standing to his credit to exceed the statutory limits, it can remain there earning interest, and be drawn out in such amounts as may be convenient from time to time. The purchaser has also the advantage of the ubiquity of the Post Office Savings Bank. He can make his deposits, and can draw out his old-age pay when it becomes due, at any one of the 13,000 odd post offices where savings bank business is transacted. He can even, if his savings are made from day to day, use the penny stamp slips introduced by Mr Fawcett, affixing a stamp whenever he has a penny to spare, and paying in the slip when it is worth a shilling. In short, every advantage open to the ordinary depositor in the Savings Bank is placed at the service of the working man or woman who wishes to secure old-age pay, or to have a small sum to aid those who may suffer pecuniarily from his or her death. Even the reluctance of many persons to submit themselves to medical examination is tenderly regarded. A policy for any sum up to £25 may, if the information afforded is satisfactory, be obtained without a doctor's certificate, on condition that, if death happens during the first year, only the premium paid is returned, and if during the second year, only half the sum insured is paid. As regards old-age pay, a purchaser can, by adopting a slightly higher scale of payment, secure the return of his purchase money if at any time before the annuity falls in he repents of his bargain. Further, employers of labour and friendly societies can, on behalf of their workmen or members, make all the payments necessary to buy an insurance or annuity, and recoup themselves out of wages or members' contributions.

The act of 1882 directed that the tables upon which annuities and policies of insurance are granted should be revised from time to time; and in February 1896 new tables reducing the rates of annual premiums, and giving greater facilities for old-age insurance, were issued. The rates are now but very slightly (less than 3%) higher than the average rates of the larger insurance offices. But the expense of small insurance business must necessarily be above the average, and it is fairer to compare the Post Office rates with those of the office which stands pre-eminent in the insurance of the working classes. Such a comparison shows that up to the age of 40 a life insurance can be effected with the Post Office at a cheaper rate than with the Prudential Insurance Company; between 40 and 60 the advantage is slightly on the side of the company.

In 1885, the first complete year after Mr Fawcett's improvement took effect, 103 deferred annuities and 457 insurance policies were granted; in 1905, 158 deferred annuities and 741 policies. The increase of business, measured in percentages, is no doubt appreciable, but the figures themselves are so small as to make such a comparison trivial. If we compare the two periods, before and after Mr Fawcett's reforms, we find that between the 17th of April 1865 and the 2nd of June 1884 (about nineteen years) 7064 policies of insurance, amounting to £557,625, were issued, and between the latter date and the end of 1905, 16,577 policies, amounting to £875,496. For the whole period the figures are 23,641 policies for £1,433,121. During the same time 3144 contracts for old-age pay, amounting in all to £64,378, were made. When we contrast with this sum total the fact that in 1905 alone 1,435,329 new accounts were opened in the Post Office Savings Bank, and more than £42,000,000 deposited in the bank in the course of the year, it becomes apparent that, while the Savings Bank has reached the mass of the population, insurance against old age and death through the Post Office has not.

In 1894 Mr C. D. Lang, the Controller of the Post Office Savings Bank, and Mr Cardin, giving evidence before the Commission on Old-Age Pensions, ascribed the small insurance and annuity business of the Post Office to the want of a personal canvass. They pointed out that there had been some temporary increase in insurance, through an appeal to the Post Office employés themselves, and they suggested that something might be done if the masters of the elementary schools could be induced to interest themselves in recommending to their scholars and the parents of their scholars the advantages offered by the Post Office. It was also pointed out that the friendly societies might, if they were so disposed, act as intermediaries between their members and the Post Office, and thereby, as it were, reinsure their risks with the government; but it was added that all overtures of this nature to the societies had failed, apparently from the fear—quite groundless—of introducing government control of the societies' affairs. There may, indeed, be another reason for the failure of the deferred annuity system. The insurance of old-age pay is not popular even amongst the members of friendly societies, or even in Germany, where it has been given to the workmen largely at the expense of other people. Insurance against death, sickness and accidents appeals to the young working man; but old age is too far off to be an object of solicitude, especially since the grant of old-age pensions by the state has made the future secure from destitution at least. However, if at any time opinion changes, the Post Office stands ready to make foresight or philanthropy easy. Though no great results have been achieved, a machinery has been established which works with perfect smoothness, and which may some day be of service to the nation.

VI. Marine Insurance

Marine insurance long antedates the kindred businesses of fire and life insurance. Villani, a 14th-century Florentine historian, speaks of marine insurance as having originated in Lombardy in 1182. This proves, at least, that in his day it was no novelty. It is mentioned in a Pisan ordinance of 1318, and in Venetian public documents of the early years of the 15th century. The earliest form of policy known is that given in the Florentine statute of 1523. It is uncertain whether insurance was introduced into England directly from Italy or by way of Flanders. The earliest policies issued in England which have yet been discovered are in Italian, but the subscriptions are in English ("Santa Maria di Venetia," Cadiz to London, 1547, "Santa Maria de Porto Salvo," Hampton to Messina, 1548).

History.

The earliest known policies in English are one of 1555 on the "Sancta Crux" "from any porte of the Isles of Indea of Calicut unto Lixborne," and one of 1557 on the "Ele" from Velis Maliga to Antwerp. The authority for this statement is Mr R. G. Marsden, who edited for the Selden Society the records of the Admiralty Court; nothing earlier had been found at the Record Office down to May 1907. In the "Sancta Crux" policy there is no detailed statement of perils insured against, or of risks undertaken by the underwriter; the whole obligation of the underwriter to the assured is embodied in the following words: "We will that this assurans shall be so strong and good as the most ample writinge of assurans, which is used to be maid in the strete of London, or in the burse of Andwerp, or in any other forme that shulde have more force." This reference to Antwerp usage is 67 years before the date of C. Malynes' statement that all Antwerp policies contained a clause providing that they should in all things be the same as policies made in Lombard Street of London. The wording of the English policies written in Italian is very much simpler than the Florentine form of 1523, from which it almost seems that the wording used in England followed an earlier Italian form. But even the Italian policies in the two "Santa Marias" mention the uses and customs of "*questa strada Lombarda di Londra*" as the standard of the assurance they afford. The next most ancient policy we possess is dated 1613; it covers goods on the "Tiger" from London to "Zante, Petrasse and Saphalonia." The "Tiger" policy is interesting in another connexion. It recalls Shakespeare's *Macbeth*, I. iii. 7 (written about 1605):—

"Her husband's to Aleppo gone, master of the 'Tiger.'"

Clark & Wright's note (in the "Clarendon Press" series edition) cites Sir Kenelm Digby's journal of 1628 mentioning "the 'Tyger' of London going for Scanderone" (Alexandretta). Hakluyt (*Voyages*) gives letters and journals of a voyage of the "Tyger of London" to Tripolis in 1583. Shakespeare again mentions a ship called the "Tiger" in *Twelfth Night*, V. iii. 63:—

"And this is he that did the 'Tiger' board."

The policy by the "Tiger" is much more ample than any of those already mentioned; it details the perils insured against in words closely resembling the Florentine formula of 1523, and differing only slightly from the form adopted by Lloyd's at a general meeting held in 1779, and afterwards incorporated in the Sea Insurance Stamp Act of 1795, which is the stem form of all modern British and American marine insurance policies.

While the form of the insurance policy was thus developing, there was a singular absence of legislation (and, as far as we can yet trace, of litigation) on the subject. Till 1601 differences seem to have been generally settled by arbitration. This accounts for the poverty of the British Admiralty records in matters of marine insurance. In 1601 a special tribunal was established by statute for summary trial of disputes arising on insurance policies; but, owing mainly to the opposition of the common-law judges, the new court languished, and by 1720 it had fallen into utter disuse. J. A. Park states that not more than sixty insurance cases were reported between 1603 and 1756. Consequently, when Lord Mansfield came to the court of king's bench in the latter year, he found a clear field. He practically created the insurance law of England. He made use of all the continental ordinances and codes extant in his day, taking his legal principles largely from them; the customs of trade he learnt from mercantile special jurors. Subsequent legislation referred solely to the prohibiting of certain insurances (wager policies, &c.), the naming in the policy of parties interested therein, and the stamp duty levied on marine insurances. In 1894 Lord Herschell introduced his Marine Insurance Bill, which endeavoured "to reproduce as exactly as possible the existing law relating to marine insurance." After Lord Herschell's death, Lord Chancellor Halsbury took up the bill, introducing it in the House of Lords in 1899 and again in 1900; he appointed a committee on which underwriters, shipowners and average adjusters were represented, and, presiding himself, went through the bill with them clause by clause. The bill was then passed by the Lords, but was always blocked in the House of Commons till 1906, when it was taken up by Lord Chancellor Loreburn in conjunction with Lord Halsbury. After some amendment and modification it was finally passed by both Houses and became law on the 1st of January 1907 (6 Ed. VII., c. 41).[1] In America a less happy fate has attended the insurance code, forming part of the proposed civil code of New York, completed and published in 1865, of which a very slightly altered version was adopted in California and has been in effect there since the 1st of January 1873. On the continent of Europe legislation at first took the form of local ordinances of commercial cities, such as Barcelona (1434–1484), Florence (1523), Burgos (1538), Bilbao (1560), Middelburg (1600), Rotterdam (1604–1655). In the third quarter of the 16th century Rouen produced a handy guide to marine insurance, *Le Guidon de la mer*; and in 1656 Étienne Cleirac published there his *Us et coutumes de la mer*. This was followed in 1681 by the *Ordonnance de la marine*, which, through Lord Mansfield, had a great effect on English case law. In 1807 France produced the *Code de commerce*, on the model of which nearly every European nation has issued a similar code. Probably the "best considered" (Willes, J.) of these, and the most adequate as regards marine insurance, is that of the German empire; but Hamburg and Bremen still preserve many of their local conditions by special contract in their policies. In fact it is doubtful whether the German Code could have been produced without the previous elaboration of the Conditions of Hamburg and of Bremen. The Hamburg Conditions of 1847, revised 1867, constitute an admirable compendium of marine insurance as practised in that city.

Conflict of laws.
